

Acerca de este libro

Esta es una copia digital de un libro que, durante generaciones, se ha conservado en las estanterías de una biblioteca, hasta que Google ha decidido escanearlo como parte de un proyecto que pretende que sea posible descubrir en línea libros de todo el mundo.

Ha sobrevivido tantos años como para que los derechos de autor hayan expirado y el libro pase a ser de dominio público. El que un libro sea de dominio público significa que nunca ha estado protegido por derechos de autor, o bien que el período legal de estos derechos ya ha expirado. Es posible que una misma obra sea de dominio público en unos países y, sin embargo, no lo sea en otros. Los libros de dominio público son nuestras puertas hacia el pasado, suponen un patrimonio histórico, cultural y de conocimientos que, a menudo, resulta difícil de descubrir.

Todas las anotaciones, marcas y otras señales en los márgenes que estén presentes en el volumen original aparecerán también en este archivo como testimonio del largo viaje que el libro ha recorrido desde el editor hasta la biblioteca y, finalmente, hasta usted.

Normas de uso

Google se enorgullece de poder colaborar con distintas bibliotecas para digitalizar los materiales de dominio público a fin de hacerlos accesibles a todo el mundo. Los libros de dominio público son patrimonio de todos, nosotros somos sus humildes guardianes. No obstante, se trata de un trabajo caro. Por este motivo, y para poder ofrecer este recurso, hemos tomado medidas para evitar que se produzca un abuso por parte de terceros con fines comerciales, y hemos incluido restricciones técnicas sobre las solicitudes automatizadas.

Asimismo, le pedimos que:

- + *Haga un uso exclusivamente no comercial de estos archivos* Hemos diseñado la Búsqueda de libros de Google para el uso de particulares; como tal, le pedimos que utilice estos archivos con fines personales, y no comerciales.
- + *No envíe solicitudes automatizadas* Por favor, no envíe solicitudes automatizadas de ningún tipo al sistema de Google. Si está llevando a cabo una investigación sobre traducción automática, reconocimiento óptico de caracteres u otros campos para los que resulte útil disfrutar de acceso a una gran cantidad de texto, por favor, envíenos un mensaje. Fomentamos el uso de materiales de dominio público con estos propósitos y seguro que podremos ayudarle.
- + *Conserve la atribución* La filigrana de Google que verá en todos los archivos es fundamental para informar a los usuarios sobre este proyecto y ayudarles a encontrar materiales adicionales en la Búsqueda de libros de Google. Por favor, no la elimine.
- + *Manténgase siempre dentro de la legalidad* Sea cual sea el uso que haga de estos materiales, recuerde que es responsable de asegurarse de que todo lo que hace es legal. No dé por sentado que, por el hecho de que una obra se considere de dominio público para los usuarios de los Estados Unidos, lo será también para los usuarios de otros países. La legislación sobre derechos de autor varía de un país a otro, y no podemos facilitar información sobre si está permitido un uso específico de algún libro. Por favor, no suponga que la aparición de un libro en nuestro programa significa que se puede utilizar de igual manera en todo el mundo. La responsabilidad ante la infracción de los derechos de autor puede ser muy grave.

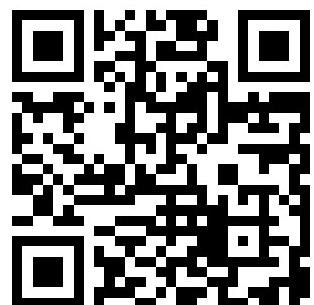

Acerca de la Búsqueda de libros de Google

El objetivo de Google consiste en organizar información procedente de todo el mundo y hacerla accesible y útil de forma universal. El programa de Búsqueda de libros de Google ayuda a los lectores a descubrir los libros de todo el mundo a la vez que ayuda a autores y editores a llegar a nuevas audiencias. Podrá realizar búsquedas en el texto completo de este libro en la web, en la página <http://books.google.com>

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

Traction: Biles, 245; B.T.-H., 37, 108, 120, 218, 229, 245, 261, 447, 483; Hobhouse, Slingo, Gunton & Douglas, 314; Kando, 340; Maley & Cadbury, 166; Oates, 208; Stuart, 84; Soc. Anon. dite S.T.A.R., 208; White, 37.

Miscellaneous: A.E.G., 420; Anschutz, 366; Bein, 493; B.T.-H. Co., 93, 96, 144, 382; Black, 445; British Westinghouse Co., 471; Collinson, 175; Conway, 340; Davies and Railing, 235; Eckmann, 364; Findlay, 374; Fournier D'Albe, 156; Glühfadenfabrik Aarau A.G., 366; Galvanophoren-Werke, 502; Green and Landon, 329; Knipe and Read, 458; Krause, 340; Leitner, 96; Lipinski, 229; Mackenzie, 399; Meigs, 409; Midgley and Vandervell, 305; Möller, 297; O'Donnell, 445; Plania-Werke A.G. für Kohlenfabrikation, 322; Quain, 481; Saint, 329; Scott, 50; Siemens-Schuckertwerke, 366, 407; Soc. Anon. Peugeot, 257; Soc. General des Nitrures, 103; Stehensnovitch, 374; Sterling Telephone & Elec. Co., 329, 445; Thornton, 93; Trensen, 366; Tulloch, 456; Vice, 1c0; Vidal, 420; Walker, 409; White and Landon, 407; Williams and Anchor Cable Co., 438

Expired Patents

Arc Lamps: Eckstein and Angold, 175; Petersson, 130
Distributing Systems, Cables and Wires, Insulating Materials, &c.: B.T.-H. Co., 508; Claremont, 399; Claremont and S. Stratton, 84, 144; Dixon, 166; Highfield, 61; Jackson, 130; Kando, 144; Sankey, 456
DYNAMOS, MOTORS, and TRANSFORMERS: Berry, 50; Brown, 130; Lahmeyer, 166; Lancashire Dynamo & Motor Co., 130; McLeod, 130
Electrometallurgy and Electrochemistry: Birmingham, 130; Bunet and Badin, 130; Corbin, 356; Société Electro-Métallurgique Française, 305
Heating and Cooking: B.T.-H., 166; Dowsing, 96; Marzetti, 130
Ignition: New Ignition Syndicate, 130; Schaffler and Weiss, 130; Sims and Bosch, 332, 356
Instruments and Meters: Batault, 108; Campbell, 108; Heap and Smith, 120; Wright and Pearson Mfg. Co., 108
Storage Batteries: Edison, 50; Lloyd, 332
Switchgear, Fuses and Fittings: B.T.-H. Co., 218, 374; Lundberg, 8; Tirman, 261; West, 130; Zweigbergk, 382
Telephony and Telegraphy: American Automatic Telephone Co., 166; Berliner 96; Blos, 166; Creed and Coulson, 50; Gell, 457; Lodge, Muirhead, and Robinson, 130; Kingsbury, 26; Muir-

head, 108, 208; Newlin, 72; Petecky, Cizek, and Luchanek, 166; Ritchie, 166; (Wireless): Marconi, 8; Fleming and Marconi's Wireless Co., 72, 483; Parsons and Sloper, 462; Wise, 175
Traction: Brown, 519; Brown and Crosta, 130; B.T.-H. Co., 374, 483; Tyer, Hollins, and Leake, 186
Miscellaneous: Armstrong, Whitworth & Co., 229, 366; B.T.-H. Co., 508; Campbell and Isherwood, 261; Edison, 218; Gese, 130; Gill, 356; Justice, 229; Marot, 130; Mavor, 462; Parsons and Ball, 130; Pott and Williamson, 261; Ship Cleaning Co. and Macdonald, 130; Smith, 130; Struhle, 493; Westinghouse Brake Co., 289

Amendments and Oppositions

Distributing Systems, Cables and Wires, Insulating Materials, &c.: B.T.-H., 72, 156; Handcock, 37, 144
DYNAMOS, MOTORS, and TRANSFORMERS: Ambertin, 96, 305; Langdon-Davies and Soames, 519; Midgley and Vandervell, 156, 245; Parsons, 409; Zenk, 120
Electrometallurgy and Electrochemistry: Acheson Graphite Co., 37; Harris, 399; Tainton, 519
Ignition: Christmas, 218
Incandescent Lamps: Bastian, 166, 186; Christmas, 332; Wolfram Lampen A.G., 420
Switchgear, Fuses, and Fittings: Barnum and Date, 297; Hemming, 84

Telegraphy and Telephony: Aitken, 120; Automatic Telephone Co., 16; Corwin, 84; Dormer, 471; Electrical Experiment Co. (U.S.A.), 261, 456; (Wireless) Galletti, 61, 332; Squier, 72, 156; Sykes, 456; Woodland, 374

Traction: Stuart, 305, 374

Miscellaneous: B.T.-H. Co. and Given, 120; Collinson, 96, 166; Combs, 261; Glassfabrik und Raffinerie, 409; Good and Woodhouse, 483; Kettering, 108; Midgley and Vandervell, 493; Quain, 493; Siemens & Halske, 399; Soc. Generale des Nitrites, 84; Thompson, 438; White, 332; Willocq, Regnault & Co., 96

Restorations, &c.

Incandescent Lamps: Hyde and Vactite Wire Co., 227; Hyde, 429
Telegraphy: Espaza, 297

Suspensions and Revocations.

Conductors: Hopfelt, Special Fabrik für Aluminium Spulen und Leitungen G.m.b.H. and Loewenthal, 120, 281
Distributing Systems: Hamilton and Ferranti, 305
Electrochemistry: Siemens Bros. & Co., 483; Siemens & Halske, 519
Ignition: Podszus, 26; Ruprecht, 108, 322; Ruthardt, 26
Miscellaneous: Baur, 72; Goldschmid, 96, 508; Herrde, 356

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

SUMMARY

TRANSMISSION of power through a submarine cable is being established between Sweden and Denmark. The cable has already been laid across the sound. A pressure of 25,000 volts will be employed (p. 2).

A NUMBER of interesting proposals with regard to municipal wiring have been deposited for the next Parliamentary session. The Lincoln Corporation have a scheme for securing co-operation with contractors. We also give particulars of the electric supply schemes promoted next session in Parliament (p. 3).

THE development committee which was formed at the last Convention of the I.M.E.A. to encourage the use of electricity from public supply mains has commenced its operations (p. 3).

THE Wharncliffe Pit disaster is attributed to a defective coal cutter in the official report, but a prosecution of the management for negligence has failed (p. 4).

A PAPER by Mr. T. J. Nelson, before the Association of Mining Electrical Engineers, reviews precautions for prevention of electrical accidents in mines (p. 4).

THE subject of earth connections in mines is dealt with in a paper by Mr. P. S. Glover before the Association of Mining Electrical Engineers (p. 4).

A CATALOGUE of electric mining apparatus is reviewed (p. 5).

ILLUSTRATED articles describe two forms of electric haulage gear (pp. 5 & 6).

AMONG the mining and metallurgical patents published during last month are two by J. G. Patterson describing details of an electric miners' lamp. Two shaft signalling systems giving visual indications of the signals are also described, and another specification

by O. Oldham is for a complete unlocking and opening apparatus for magnetically locked flame lamps. T. T. Snyder has patented a method of current control for electric furnaces (p. 6).

THE testing of field magnet castings is discussed in our Questions and Answers columns (p. 7).

ONE of the most interesting of the Specifications published at the Patent Office last Thursday is a Marconi patent for an oscillation valve receiver of improved form arranged to be able to respond to continuous oscillations. A patent for tumbler switches by A. P. & G. C. Lundberg, and three Marconi patents expire this week after a life of fourteen years (p. 8).

Two 8,000 kw. turbo-generators are required by the L.C.C.; new mains at Nottingham (£20,000); a transformer station (£18,252) and mains (£25,000) at Salford; services at Worcester; new plant at Woolwich (£32,935); Darlington (£20,000); Birmingham (£97,300); and Belfast (£28,390).—Water-tube boilers, economisers, &c., are required at Tunbridge Wells; electric lamps at Camberwell; and stores at Croydon and Dublin (p. 9).

A BREAKDOWN on a high-tension feeder caused a partial interruption of supply for a quarter-of-an-hour in Glasgow on Saturday.—The duplicate gas-driven generating plant at Accrington is now in operation.—A dispute has arisen between owners of cinematograph theatres and the Electricity Committee at Brighouse.—A scheme for dealing with the contracts for arc lamps on hire, owing to the reduced lighting in London, has been approved at East Ham (p. 10).

AN important report has been prepared by Mr. A. H. Seabrook, General Manager of the Marylebone Electricity Undertaking, upon the L.C.C. Power Bill, which is to be opposed by the Marylebone Council (p. 10).

Arrangements for the Week.—(To-day) Thursday, Jan. 7th.—Greenock Electrical Society, 21 West Stewart Street. "Developments in the Electrical Industry," by D. McDougall. 7.45 p.m.

Saturday, Jan. 9th.—Association of Mining Electrical Engineers, South Wales Branch, Carlton Café, Queen Street, Cardiff. "The Prevention of Electrical Accidents in Mines," by T. J. Nelson. 6 p.m.

Monday, Jan. 11th.—Institution of Mechanical Engineers, Graduates' Section. "Semi-Diesel Engines," by R. A. Pfleiderer.

Thursday, Jan. 14th.—Institution of Electrical Engineers. "The Shape of the Pressure Wave in Electrical Machinery," by Dr. S. P. Smith and R. S. H. Boulding. 8 p.m.

SUBMARINE ELECTRIC POWER TRANSMISSION

DENMARK and Sweden are only separated by about three and a half miles of water at the narrowest part of the Sound. Denmark is without water-power and without coal, while Sweden has both. It is natural, therefore, that the question of transmission of electric power from Sweden to Denmark has long been under consideration. The work of coupling up the two countries in this manner has commenced, and a high-pressure cable has already been laid under the sea across the Sound. It is proposed to employ this experimentally for two or three years, and, if then it is found that the arrangement works, two more cables will be laid, and the electric light and power-supply in Copenhagen, and over an area of nearly 500 square miles, chiefly to the north and west of that city, will gradually be transferred to the new system.

This will be the first instance of a submarine supply of electric light and power for industrial purposes between two countries, although there have been a few cases of electric power transmission from one country to another. It is not generally known that Nancy, Toul, and Verdun get part of their electric power from German Lorraine, or, at any rate, got it before the outbreak of the war; it would, by the way, be interesting to know the present condition of this power transmission. In addition, there is electric power transmission from Silesia (Germany) to Austria, and from the south of Switzerland to Italy. The Rheinfelden works in Switzerland, situated on the Swiss side of the Rhine, supply electric power across the German frontier as well as on the Swiss side of the Rhine, which power would doubtless be declared contraband of war in the event of Switzerland's neutrality not being respected by Germany in the present struggle on the Continent.

The Swedish-Danish power cable is laid from Pälsjö, three miles north of Helsingborg, in Sweden, to a point near Marienlyst just north of Elsinore. (Marienlyst and the castle of Kronborg, between Marienlyst and Elsinore, are supposed, by the way, to be the site of the mythical incidents of the play of Hamlet, and tourists to Marienlyst are shown "Hamlet's grave" and "Ophelia's brook" by enterprising guides.) The submarine cable will carry current at the extremely high pressure of 25,000 volts. It is a three-core cable, each section of the core being 70 sq. mm. (about 0'1 sq. in.). Paper-insulated lead-covered cable is employed with a thickness of 13 mm. (0'51 in.) of insulation between the conductors and also between the conductors and lead. Outside the lead sheathing is an interlocked armouring (Z shaped) 6 mm. thick, bringing the external diameter of the cable to 92 mm. (3'6 ins.), and the weight of the cable to about 57 lbs. per yard. The cable, which is of German manufacture, was delivered in nine lengths of about 650 yds., each on separate drums.

A very simple method has been adopted for joining up the lengths. A lead sleeve-joint filled with compound is employed, and this is surrounded by a steel sleeve 5 ft. long, which has a special arrangement to clamp the armouring in such a way as to withstand the tension on the joint as it is laid down into the water. The steel sleeve is covered with asphalt and wound round with asphalted ribbon, and all the external bolt heads on it are covered with zinc caps filled with an asphalt compound to prevent rust.

The cable was laid and jointed between July 7th and 28th of last year with the assistance of the cable ship *Peter Faber*, belonging to the Danish Telegraph Service. Each drum of cable weighed nearly 20 tons, so only one drum was taken on board at a time, and the cable ship was propelled partly on its own steam and partly with the assistance of a tug. The jointing was carried out on the barge, upon which inverted U-irons were employed to prevent cutting at the edge of the barge. A small hut was erected on the barge to protect the joint against damp. The barge was placed crosswise with the cable for making the joint, and, on the work being completed, the joint was lowered gradually by ropes, leaving sufficient slack for subsequent examination and repairs.

To protect against dragging anchors, a steel cable of about 40 tons breaking stress has been laid parallel to the cables about 110 yds. to the north. This cable contains the telephone wires connecting the Helsingborg and Elsinore transformer stations. The additional high-tension cables, if the first one should prove effective, will each be laid another 110 yds. to the south of the first one. The line of route is parallel to that taken by the Government telegraph cables connecting the two countries, and a distance of about 660 yds. from the nearest of these. As a guide to ships not to anchor near the

cables the position is indicated on both coasts by double landmarks in the ordinary manner, in line with the protecting cable. These landmarks are iron lattice towers 164 ft. high, and covering a ground space of about 13 by 20 ft. White boards are fixed upon the iron structures, and after dark they will be lighted with green revolving lights. The protecting cable, which was made and laid in one length, has an outside diameter of just over 2 ins., and weighs about 20 lbs. per yd. The telephone wires are insulated with gutta percha. Except near the coast the high-tension cables have simply been laid directly in the bed of the sea, but near the coast they are protected with steel tubes dug in as much as possible to protect the cable being damaged by the action of the waves. On the Danish side, from the coast to beyond the Island of Lappen, owing to the water being comparatively shallow (viz., up to about 40 ft. deep), it has been particularly important to dig the cables in deep, for, in unfavourable weather, many small vessels anchor there. The greatest depth of the cables in the Sound is 125 ft.

The general scheme for power transmission is as follows: current will be supplied by the South Swedish Power Co., which was established in 1906 to utilise the power of the River Lagan for supplying towns in the south of Sweden with electricity. This Company has four power stations: one at Majenfors, one at Bassalt, and two at Knäred, all within three or four miles of one another, and 46½ miles north-east of Helsingborg. The aggregate capacity of these stations is 19,000 kw., and their present yearly output is between 50 to 60 million kw. hours. In the near future, however, the entire power available from these stations will be taken up, and arrangements have been made to extend the system. The Company has bought three waterfalls at the town of Lagan, about 12 miles to the west of the existing power station, from which an aggregate of about 7,000 kw. will be available. A 5,000 kw. steam station is being built at Malmö (between 60 and 70 miles south of the Lagan), and, finally, an agreement has been made with the Högenäs & Billesholm Co. to deliver at an intermediate point initially 2,000, and later 7,000, kw. from a station to be built at Ormstorp, utilising a low-grade coal which is mined there; thus, eventually, nearly 40,000 kw. will be available. Power from the Lagan stations is transmitted at 50,000 volts three-phase to the various distributing centres by copper conductors on iron poles, and the more important main cables are duplicated. The Company's network extends from Halmstad in the north to Trelleborg in the south, these two places being about 90 miles apart. The extent of the whole network is nearly 200 miles. The 50,000 volts at which current is transmitted from the stations is stepped down to from 3,000 to 5,000 in the towns and to 20,000 in the country for the distributing networks. The Helsingborg transformer station, from which the submarine cable to Denmark is supplied, is about 9½ miles to the west of Mörarp, at which is a switching station roughly half-way between the extreme north and south points of the Swedish Power Company's network. It is 37 miles from Knäred, from which station it will be supplied. The existing transformer station at Helsingborg is being extended, and additional plant put in to reduce the 50,000 volt-line pressure to 25,000 volts. Current at this pressure is first taken through three miles of underground cable to the coast at Pälsjö, the point from which the submarine cable starts. At the Danish side there are two underground cables about a mile long to a transformer station near Esrom, west of Elsinore, where the pressure will again be raised to 50,000 volts, and the current will be transmitted 20 miles through two three-phase copper lines on iron masts to the chief transformer station at Gentofte, north of Copenhagen. From here four or five new feeders of the North Zealand electricity works will connect up to the chief transformer station, from which, in future, the whole supply in this part of Zealand is to come, so that the Company's existing works at Skovshoved can be shut down. The lines of the North Zealand Co. stretch south almost to Kalvebodstrand, west to Roskilde, north-west to Lillerød, and north to Elsinore, and the total length of the network is nearly 100 miles. Both in the Elsinore and the Gentofte transformer stations current from Sweden will be stepped down to 10,000 volts, so that Elsinore can supply the northern part of the North Zealand network direct at the pressure now used.

All the overhead wires are protected by an earthed wire above them to protect them against atmospheric discharges, and there are, of course, efficient lightning protectors at the transformer stations. For the transmission between the two countries the mains are duplicated both on the Danish and Swedish sides, each set being in itself sufficient to take the full maximum load of 5,000 kw. The underground

cables from the transformer station to the coast are of the same copper section as the submarine cables, but the radial thickness of the insulation is only 11 mm. (0'485 in.), instead of 13 mm. (0'51 in.), and the armouring over the lead is simply the usual iron tape. The external diameter is 78 mm. (3'06 in.), and the weight about 37½ lbs. per yard. As has already been mentioned, the second submarine cable will probably only be laid in a couple of years' time, and after that possibly a third cable. The 50,000-volt overhead line from Elsinore to Gentofte has also not been erected yet. When ultimately the actual transmission of power between the two countries is established, it is still proposed to keep the steam plant of the North Zealand Co. in reserve with sufficient capacity for the whole supply. The above particulars are taken from a Paper recently read by Mr. A. R. Angelo before the Danish Institution of Engineers.

MUNICIPAL WIRING SCHEMES AND OTHER PARLIAMENTARY BILLS

AS we mentioned on p. 617 of our issue for Dec. 3rd, a number of municipalities this year will ask Parliament for wiring powers, etc. We are now able, from the Bills themselves, to give more exact details of what is being proposed.

The Edinburgh Corporation have a clause in their General Powers Bill authorising them to sell and hire directly motors, fittings and apparatus for all purposes for which electric power can be used except lighting. A similar proposal was brought forward by the Electricity Committee last year, but was outvoted and not confirmed by the Corporation, pressure having been brought to bear by the Edinburgh electrical contractors. They are again opposing this time, and a manifesto bearing the names of some hundred firms has been issued.

The Doncaster, Shrewsbury, Plymouth, and South Shields Corporations, and the Lurgan Urban District Council, ask for full wiring and hiring powers, but undertake to enter into agreements with contractors for the wiring of consumers' premises.

The most interesting proposal of all is that of the Lincoln Corporation, which asks for full wiring and hiring powers, with the option of entering into agreements with contractors; but, in a special clause, provision is made for securing co-operation between the Corporation and the electrical contractors in the following terms:—

With the view to securing co-operation between the Corporation and persons carrying on the business of supplying fittings (in this Act called "electrical contractors"), the following provisions shall apply:—

(a) When the Corporation provide showrooms for the purpose of selling or letting fittings, they shall, at the request of any electrical contractor whose shop or place of business is situate within the area of supply of the Corporation, give to him, when practicable, reasonable facilities for enabling his customers whose premises are situate in the said area to attend such showrooms and to inspect the fittings therein.

(b) Any electrical contractor who shall at the express request of the Corporation sell any fittings on their behalf, shall, subject to any agreement which may be made between them, be entitled to receive, out of the purchase money paid to the Corporation, a sum calculated at the rate ordinarily allowed as discount in respect of such fittings by the makers thereof to electrical contractors and based on the amount actually received by the Corporation in respect thereof.

(c) If the Corporation pay a commission to the persons employed by them in respect of the sale or letting of fittings, they shall pay a commission at the same rate and under similar conditions to any electrical contractor upon whose introduction any fittings are sold or let by the Corporation.

(d) The Corporation shall not themselves execute the wiring of private property except between the main of the Corporation and the consumer's meter, but they may enter into contracts for the execution of wiring under sub-section (2) of this section, provided that—

(i) In making any such contracts for wiring, the Corporation shall not in cases where there are more than one electrical contractor whose shop or place of business is situate in their area of supply give any undue preference to any electrical contractors.

(ii) The Corporation shall not be subject to the restrictions contained in division (d) of this sub-section in any case where there is not effective competition between the electrical contractors carrying on business in the area of supply of the Corporation with regard to the execution of contracts on behalf of the Corporation.

(iii) Any question which may arise between the Corporation and any electrical contractor under division (d) of this sub-

section shall be settled by arbitration under the provisions of the Arbitration Act, 1889.

In all these Bills some form of "Bermondsey" clause is inserted, by which the expenditure on this part of the undertaking is to be adjusted in order, as far as possible, to prevent any loss.

In the Lincoln Bill there are two other interesting clauses. One gives the Corporation the right to insist upon certain standards of wiring for various classes of premises, and the other extends the provisions of Section 4 of the Conspiracy and Protection of Property Act to the electricity works employees. In other words, it prohibits them from striking. The North Metropolitan Electric Power Co. promoted a similar clause last year, but withdrew it after considerable protest by labour interests in London.

As in every branch of private Bill legislation for the 1915 session of Parliament, the number of Bills dealing with electric supply, as compared with previous sessions, shows a very considerable diminution. Indeed, there are only two, apart from the wiring Bills mentioned in the preceding column. The first of these is by the Yorkshire Electric Power Co., which revives the scheme (rejected by Parliament last session on a technical point with regard to notices) for giving a supply of electrical energy in those districts where at present there is no authorised distributor. Other clauses in the Bill deal with the conversion of the company's capital by transferring every £10 ordinary share into ten £1 ordinary shares, and every £5 preference share into five £1 preference shares.

The other Bill is by the Stalybridge, Hyde, Mossley & Dukinfield Tramways and Electricity Board, which seeks to extend its area to include Saddleworth, Springhead, and Lees, and also to take in certain small areas in the County of Cheshire.

In addition, it is proposed to take over the Urban Electric Supply Company's generating station at Glossop, and to borrow £5,500 in respect of new generating plant.

THE I.M.E.A. DEVELOPMENT COMMITTEE

THE first meeting of the Development Committee, which was formed at the last convention of the Incorporated Municipal Electrical Association (see ELECTRICAL ENGINEERING, June 25th, 1914, p. 368), held its first meeting at the Institution of Electrical Engineers on Dec. 11th last. It will be remembered that this Committee was formed as a result of a resolution moved by Mr. W. A. Vignoles (Chief Engineer, Grimsby Electricity Department), its object being to deal with any matters tending to encourage the use of electricity from public supply mains. The membership as originally constituted was as follows: Messrs. F. Ayton (Ipswich), J. W. Beauchamp (West Ham), A. S. Blackman (Sunderland), R. A. Chattock (Birmingham), A. C. Cramb (Croydon), Councillor Crowther (Sheffield), J. E. Edgecome (Kingston), S. E. Fedden (Sheffield), F. M. Long (Norwich), Alderman Pearson (Bristol), H. Faraday Proctor (Bristol), H. Richardson (Dundee), T. Roles (Bradford), A. H. Seabrook (Marylebone), Alderman J. P. Smith (Barrow), W. A. Vignoles (Grimsby). The Council of the I.M.E.A. had appointed Mr. W. A. Vignoles as honorary secretary, but on account of his absence on military service this work was taken over temporarily by Mr. J. W. Beauchamp. At the meeting Mr. S. E. Fedden (General Manager, Sheffield Electricity Department) was elected Chairman, and Mr. S. T. Allen (Wolverhampton) and Mr. H. F. Street (Southampton) were elected additional members of the Committee.

It was decided, if possible, to co-opt members representing the various Associations connected with the supply of electricity and allied interests, and the Secretary was instructed to approach these bodies with regard to the election of representatives. It was also decided, as soon as practicable, to form certain sub-committees to deal in a specialised manner with various questions of interest at the present moment. Following a suggestion in a communication from Mr. F. Ayton (Ipswich) it was proposed to form Technical sub-committees with the object of investigating problems of interest which might arise during the year, and with a view if possible to presenting the results in the form of reports, to be discussed at the Annual Convention of the I.M.E.A. Informal discussions were also held with regard to the future policy of the Committee and the objects to which primary attention should be directed. The next meeting will take place in January, when it is hoped that work upon some of the above objects may be put in hand.

A False Description.—A defendant was recently fined £5 and costs in New Zealand for using the letters A.M.I.E.E. after his name without being entitled to do so. The New Zealand Police Offences Act contains specific clauses relating to such offences, for which the maximum penalty is £20.

ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Published on the First Thursday of each month

THE WHARNECLIFFE PIT DISASTER

THE report of Mr. S. Pope and Mr. T. H. Mottram on the explosion which took place at the Wharnecliffe Silkstone Colliery on May 30th (see ELECTRICAL ENGINEERING, Aug. 6th, p. 442, and Sept. 3rd, p. 482) confirms the finding of the coroner's jury to the effect that the explosion was caused "by the stoppage and restarting of the fan with a defective coal-cutter running at the face." It is further pointed out that the electrically-driven coal-cutter was found in a condition which left no room for doubt that it was running at the moment of the explosion. The defects observable in the coal-cutter put the machine under violent suspicion, whilst the lamps picked up in the area affected by the explosion came through tests at Eskmeals and Leeds University. Moreover, Mr. G. Blake Walker frankly stated in his evidence that in default of any other source of possible ignition being found, he must assume that the ignition took place at the coal-cutting machine. Mr. R. Nelson (H.M. Electrical Inspector of Mines) also stated that it was "impossible to resist the conclusion that the coal-cutter did, in fact, on this occasion fire the gas." This disaster, continues the report, emphasises again the importance of systematic supervision of electrical apparatus. The coal-cutter was not flame-tight. The joint between the commutator box cover and the body of the machine was defective. There was at one place a gap or aperture in the joint measuring half an inch long by about three-sixteenths wide at one end, tapering to nothing at the other, and there was a second gap or aperture of lesser dimensions. There was external indication of the larger aperture. The apertures were the result of some ill-usage of the half-moon plate, a portion of the motor case which had to be removed when an armature was taken out of or put in the machine. It ought not to have been possible for the coal-cutting machine to have got into the condition and be worked in the condition in which it was found. It would have imposed no serious burden upon the electrical staff in addition to the routine weekly inspection, which the evidence showed to have been carried out, to have inspected the machine thoroughly for flame-proofness after every time it was opened out for replacing an armature, and had this been done on the occasion when the new armature was put in on the morning of May 29th, we believe that the defect in the cover would have been seen.

The sequel to the report was the prosecution of the Company and certain officials at Barnsley on Dec. 16th by the Home Office. The charge, however, relating to neglecting to work and maintain the coal-cutter so that there was "no risk of open sparking" was dismissed on the ground that there had been no proof of criminal negligence.

PREVENTION OF ELECTRICAL ACCIDENTS IN MINES

A Paper by Mr. T. J. Nelson with the above title has been read before the South Wales and other Branches of the Association of Mining Electrical Engineers. In order to provide against accidents due to shock, ignition or fire due to electrical causes, it was necessary to provide reliable connection to earth of all outer metallic covers of apparatus, to cover all live parts with good quality insulating material, to use apparatus which had been designed to prevent open sparking, and to avoid the use of inflammable material near electrical apparatus. The Home Office Rules for securing safety were admirable, but there were various properties of electrical plant only influenced indirectly by them. Passing on to matters of detail, the author expressed a preference for vulcanised bitumen over paper cables, at any rate up to 3,000 volts. Among other details, he emphasised that shafted cables should be supported by cleats 25 to 40 yards apart, should be in one length wherever possible, and that underground cables should be suspended by slings which would readily break away when struck by a fall. All cables should be inspected daily. For A.C. work only oil switches should be used, and the following points should receive attention:—There should be satisfactory provision for earthing, and the apparatus should be so constructed that it can be operated with perfect safety by unskilled workmen; substantial

mechanical terminals should be fitted, because soldering is often prohibited in parts of the mine. It should be possible for inspection, cleaning, and repairs to be carried out with safety. This is best achieved by the draw-out type of gear which enables the switch and all its working parts to be withdrawn from the live connections and, if necessary, taken away as a complete piece of apparatus; all joints, tanks, and castings should be made explosion-proof; the oil tank should be clearly marked with the correct oil level, which should allow an ample head of oil over the switch contacts; all sparking tips should be readily renewable.

The author then summed up some of the requirements of mining motors. For coal-cutters he favoured the bar-wound slip-ring induction motor. Coal-cutter trailing cables were preferably not armoured, but should contain a separate earthing conductor. Underground lighting should never be carried out by lamps in series on a medium-pressure supply. Where alternating current was used, he recommended it to be transformed down to 50 volts for lighting purposes. All bells and signalling keys should be in explosion-proof cases. From the point of view of safety, the earthing system was of vital importance. Earth plates should be sunk where the ground was damp, and copper earth-wires should be provided, bonded to the cable armouring at intervals, instead of relying only on the continuity of the armouring. The resistance of the earth circuit which had to be met—not more than twice that of the largest conductor in the system—could easily be measured by means of the "Dueter." For large installations, the author recommended the use of local earths underground in case of the main earth becoming faulty. The Paper concluded with a few words on protective and leakage recording devices.

EARTHING

A PAPER entitled "Surface Earthing at Scottish Mines" has recently been read by Mr. P. S. Glover at the West of Scotland Branch of the Association of Mining Electrical Engineers. He summed up the main features of colliery earthing systems as follows:—All apparatus above and below ground must be earthed at the surface; the metallic covering of cables is the most satisfactory earth conductor, subject to the required conductivity; a separate earth-wire is sometimes considered a valuable addition, and this is particularly so when the pit water is of such a nature as to cause corrosive action in the armouring of the cables; where unarmoured cables are still in use, an independent earth-wire run throughout the pit is a necessity; two or more earth-plates must be installed on the surface; local earth-plates underground may constitute a desirable addition under certain conditions. The Home Office Rules specified that all metallic sheaths, coverings, frames, and bed-plates of generators, transformers, motors, &c., shall be earthed by connection to an earthing system at the surface of the mine, and the memorandum accompanying the rules recommends that the earthing system should be of sufficient capacity, having regard to the current which it may have to disperse, and to the nature of the surface ground and its condition as regards moisture. Two earth-plates properly placed 20 to 30 ft. apart in good surroundings and connected to each other are stated to be nearly twice as efficient as a single earth-plate equal in surface area to the two together. The Board of Trade regulations for electric tramways speak of a maximum resistance of 2 ohms for an earth connection, but the author's experience leads him to believe that in many cases it is impossible, at any rate in colliery work, to obtain anything like so low a figure, and he gives results of tests of carefully-made earth connections varying from 3·8 to 19·0 ohms. The author favours a plain plate of copper or galvanised iron, about 4 ft. square, the copper plate being 1/16th in. to $\frac{1}{4}$ in. thick, and the iron plate $\frac{1}{4}$ in. to $\frac{3}{8}$ in. thick. These should be buried vertically in permanent earth at a depth of about 6 ft., and packed hard on each side and under the bottom edge with about 12 in. thickness of broken coke. The position and depth will depend upon local conditions. If a permanently moist position cannot be obtained, a water supply should be carried to each plate, ensuring that the ground is constantly moist.

ELECTRICAL PLANT AND APPARATUS FOR MINES

A COMPREHENSIVE "Bulletin" on Colliery and Mining Machinery (Part II.) has been issued by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), and forms

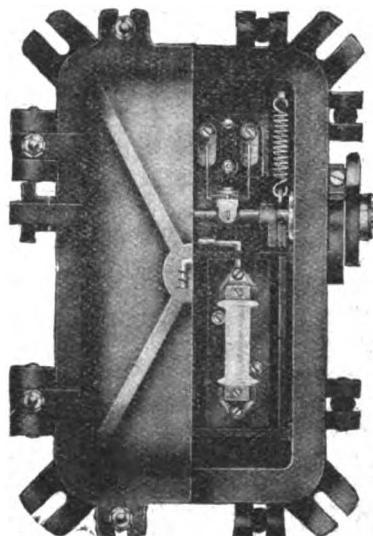

FIG. 1.—15-AMPERE FLAME-PROOF SWITCH WITH "BOBBIN" FUSES.

a catalogue covering a very considerable range of colliery apparatus. Turbine-driven and other generators, motor

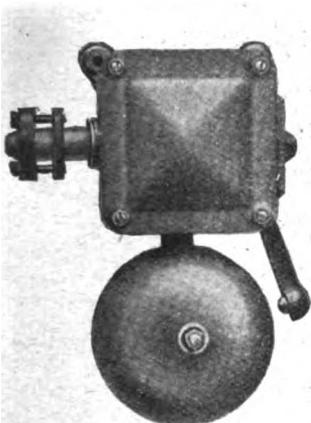

FIG. 2.—FLAME-PROOF BELL.

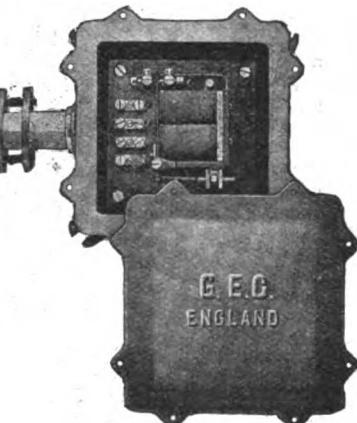

FIG. 3.—FLAME-PROOF RELAY.

rotary converters, &c., are dealt with in the introductory portion, and illustrations give a good idea of the way in

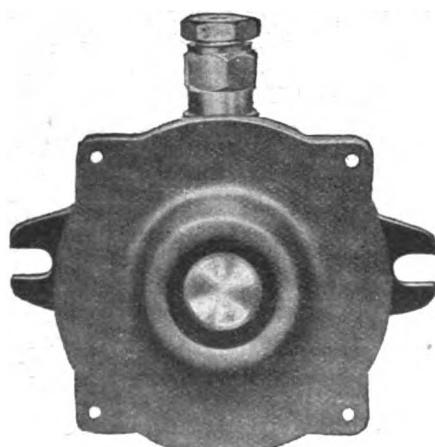

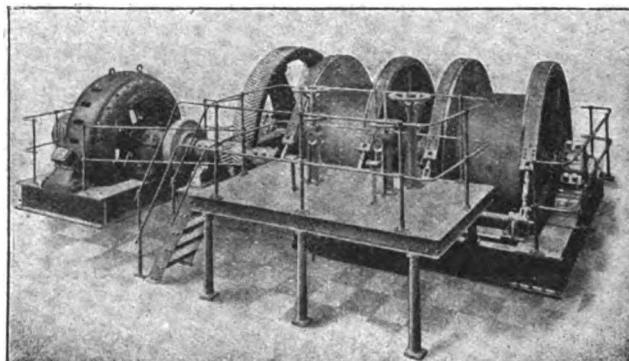

FIG. 4.—FLAME-PROOF RINGING KEY.

which the Company have specialised in mining requirements. Starters and controllers of every class both for fiery and non-

fiery mines are next listed, and there is a long section on ironclad switchgear, ranging from the familiar "Salford" ironclad switches, with or without fuses, to complete high-tension switch units with boiler-plate panels, and the latest refinements of mistake-proof interlocking, and including such special explosion-proof apparatus with broad machined flange joints as is illustrated in Fig. 1. Other features are iron-clad distributing-boards and circuit-breakers. A considerable variety of forms of surge protection apparatus is also listed, and a complete range of switchboard and other instruments is also included. Further items, too numerous to particularise, embrace lighting and traction accessories, ventilating fans, small transformers, arc and incandescent lamps, cables, and porcelain insulators, together with conduit material, fittings, and hand-lamps. Particular attention should be called to the signalling section, which describes the "Kingsway" system of mine signalling, giving visual as well as audible indications as now required by the Home Office Regulations. The Company have a special design of flame-proof bell, as illustrated in Fig. 2. A flame-proof relay and a form of ringing key used in this system of signalling are illustrated in Figs. 3 and 4. This section also contains particulars of luminous indicators, batteries, telephones, &c. The whole publication is very well arranged and illustrated, and should be of great use to mining electrical engineers.

HAULAGE MOTORS

SPECIALISING in the production of motors for colliery work, the General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.), turn out annually a number of large motors for driving haulage gears both in this country and abroad. A typical example of their recent practice is shown in the accompanying illustration depicting a Witton motor driving a haulage gear supplied to a large North of England colliery. This motor has a capacity of 600 h.p., and is directly coupled to a large main-and-tail haulage gear constructed for drawing its load at a mean rope

600 H.P. WITTON MOTOR DRIVING A MAIN-AND-TAIL HAULAGE GEAR IN A NORTH OF ENGLAND COLLIERY.

speed of ten miles an hour. The motor is supplied by a 3,000 volt, forty-cycle, three-phase circuit, and runs at a speed of 400 r.p.m. Its slip-rings are enclosed in flame-proof covers. The gearing between the motor and the drums is of steel, with machine-cut double helical teeth. The drums are 6 ft. diameter, width between flanges 8 ft., and the diameter of the flanges 9 ft. The drum shaft is 12 in. in diameter. A steel bedplate is provided of special strength. The operator sits upon a separate platform with all the levers in convenient positions.

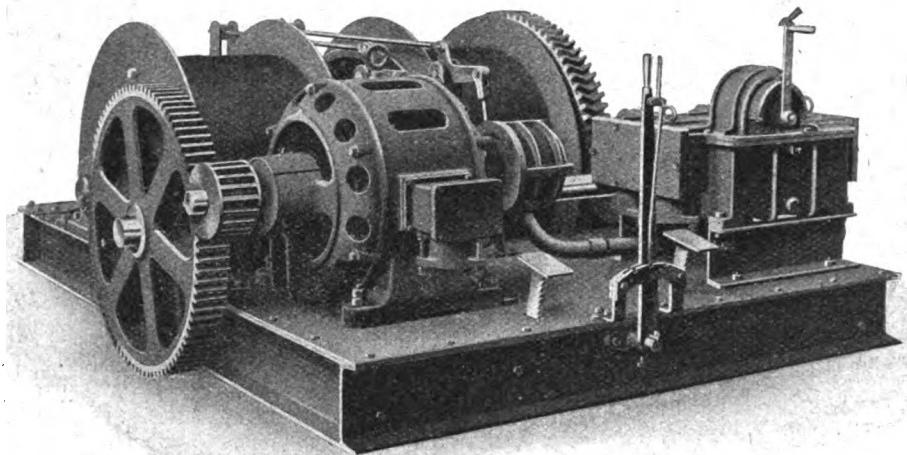

Armoured Cables in Haulage Roads.—An appeal of the Shotts Iron Co. against the decision of the Sheriff at Hamilton, in a recent prosecution for failing to have certain cables along a haulage road protected by a metallic covering, has been dismissed with costs. The original case was referred to in ELECTRICAL ENGINEERING, Nov. 5th, p. 573. It appeared that the cables were originally put in before the date when the new Regulations came into force in another part of the mine, being thus exempt from the regulation, but had lately been moved to the haulage road. The question was whether, owing to this removal, they were to be classed as new work, and not still entitled to exemption. The Sheriff held that this was so, and inflicted a nominal fine of £1 on the company, dismissing the charges against the officials.

ELECTRIC HAULAGE GEAR

WE illustrate here an electric main and tail haulage gear which is one of several types supplied by the Electrical Engineering & Equipment Co., Ltd. (109-111 New Oxford Street, W.C.). These gears are of British manufacture throughout; both the mechanical portion and the electrical equipment are made in the Company's own works. Haulage gears of this and similar types have been supplied to some twenty-four colliery owners throughout the country. The motors are specially designed for haulage work and to withstand rough usage and frequent overload, and, where required, gas-tight motors and controllers complying with

read the number of cells put in circuit by the sending apparatus. This is varied by a dial switch, which is set according to number of rings constituting the signal. A lamp illuminated by the action of a relay can be added to call the driver's attention when a signal is about to be made.

Another mining signal is that described by H. D. Bayley and B. Frogatt, of Bulwell, Notts, in No. 27,709 of 1913. In this apparatus, the pointer of the indicator, with a sector carrying translucent figures to be illuminated from behind, is actuated by an electromagnetic escapement mechanism so that it moves forward one step for every ring of the bell. A recording mechanism is also provided, by which the signals

ELECTRICAL MAIN AND TAIL HAULAGE GEAR.

the Home Office conditions are supplied. The set illustrated is fitted with three-phase motor having flame-proof slip rings and trifurcating box with earthing glands for taking armoured cable. The winding drums are made with mild steel plates. The drum shaft is made hexagonal in the middle, to receive the sliding clutch. The brake gears are of the adjustable post type. They are very powerful and will hold the full load with ease. The gear wheel on the drum shaft is a cast-iron machine-moulded double helical spur wheel which gears into a suitable pinion on the second shaft, and the first motion consists of a machine-cut spur wheel gearing into a raw hide pinion on the motor shaft.

ELECTRICAL MINING AND METALLURGICAL PATENTS OF DECEMBER

Mining.

A NEW form of electric miners' lamp is referred to in Specification No. 25,210 of 1913, by J. G. Patterson, which describes improvements in the construction of the bayonet joint, comprising a ring on the upper part, or lamp cage, having a depending flange, the internal surface of which closely fits the outside of the lamp case, and an outwardly flanged ring screwed to the underside of the upper ring, and carrying outwardly projecting segment pieces at its lower portion for co-operation with inwardly projecting segment pieces fixed within the lamp case. The edge of the flange in this way is spaced from the inner surface of the defending flange so as to form an annular recess for the reception of the upper edge of the lamp case, and makes a flame tight joint. A special form of spring terminal is employed on the accumulator, which is described in Specification No. 21,968 of 1914. A section of the lamp showing the terminal is given in the accompanying illustration.

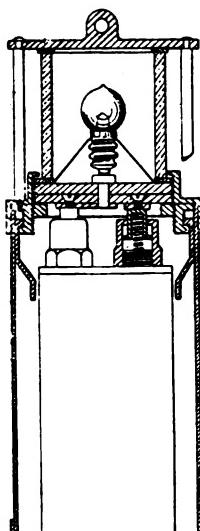

A signalling system designed to give visual indications of shaft signals is described by F. Smith in No. 28,004 of 1913. The indicating instrument takes the form of a large voltmeter, graduated to

are printed on a paper strip continuously driven forward by a clock.

A complete machine for unlocking and opening magnetically-locked flame safety lamps is described in No. 2,249 of 1914 by O. Oldham. The lamp is placed on a circular platform on which it is gripped. It is first unlocked by an adjacent electromagnet, controlled by a foot switch, and the bottom is then unscrewed by rotating the platform by a bevel gear worked by a small crank handle.

Metallurgical.

Specification No. 25,171, of 1913, by T. T. Snyder, details a method of regulating the temperature of an electric furnace and stabilising the arc by providing a resistor having a negative temperature-resistance coefficient, and making the shell of the furnace of laminated steel forming a reactance so proportioned that an increased flow of current above the normal full load will cause a decrease in the energy developed in the furnace.

Home Office Prosecution.—In ELECTRICAL ENGINEERING, Dec. 3rd, p. 619, we referred to a charge brought against the Greenside Mining Co., Ltd., and the manager, Mr. W. H. Borlase, at Hackthorpe, for using an electric locomotive with overhead conductors without the consent of the Home Secretary, which was dismissed on the ground that the special rules in question had not been received. A similar charge was accordingly brought relating to a later date. It appears that the locomotive has been running for 21 years, and the defence stated that when the rules were first sent to the company they gave notice of objection, and then waited for the Home Office to take the next step and to refer the matter to arbitration. Finally, the case was adjourned for three months.

The Case for the Electric Lamp.—In the course of a Paper with this title read recently before the Midland Institute of Mining, Civil and Mechanical Engineers, Mr. W. Maurice summed up the advantages of the electric miners' lamp over the flame safety lamp as follows:—Cleaner coal. Increased output per man, whether engaged in stall- or road-work. Less time lost in starting work. Less time lost in re-lighting lamps. More effective supervision. Enormously diminished risk of firedamp explosions and underground fires. Fewer accidents from falls of roof and side. Fewer haulage accidents. Fewer miscellaneous accidents. Reduction in the number of cases and probably a complete elimination of miners' nystagmus. Reduced cost of insurance and compensation for injuries. More agreeable conditions of labour.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,424.

Explain the method of calculating reactances with iron core and air return circuit, such as are used for feeder protection.—**POSTULATOR.**

(Replies must be received not later than first post Thursday, January 14th.)

ANSWER TO No. 1,422.

Describe a workshop method of testing the permeability of dynamo yokes after machining. The diameter of yoke is about 20 in., and the test is required to show whether the yoke is homogeneous.—**S. K.**

An award of 10s. is given to "L. R." for the following reply :

The best apparatus to use for this purpose is the Drysdale permeameter, in which both the specimen and the greater part of the material form part of the magnetic circuit. In this arrangement a drill of a special form is employed which cuts a circular hole in the specimen, conical at the top, leaving a pin in the centre of it. In the instrument as usually made this hole is $\frac{1}{8}$ in. diameter and $\frac{1}{8}$ in. deep, and the diameter of the pin is 1/10 in., but these dimensions can be changed, the pin often being as small as 1/20 in. diameter, and the drilling 1 in. deep instead of $\frac{1}{8}$ in. These latter dimensions give as great a ratio of length to diameter as is used in the ordinary yoke permeameters. The testing arrangement comprises a soft iron plug carrying a bobbin on which are wound two coils, viz., a magnetising coil and a search coil. The plug is split and is turned slightly conical on its outer surface, the drill cutting the cone of the same angle as that of the plug. By drilling the hole as described and inserting the plug a miniature permeameter is produced which has an exceedingly good magnetic circuit, the return path taking place through the bulk of the casting.

Permeability can be tested with this apparatus by any of the ordinary methods, the most simple, and one well adapted in connection with workshop practice, utilising a ballistic galvanometer. In this arrangement the magnetising coil of the plug is supplied with current from a battery through a regulating resistance, ammeter, and reversing switch. The search coil is connected to the ballistic galvanometer. On making, breaking, and reversing the switch, deflections are obtained on the galvanometer proportional to the magnetisation of the specimen. In order to make the instruments direct reading, the ammeter can be provided with a scale so that it indicates the values of H . In the same way a scale is provided for the ballistic galvanometer reading the values of B directly. The permeability is then obtained, if necessary, by dividing the value B by that of H , but in the ordinary commercial testing of castings, &c., it is generally sufficient to compare the values of B obtained with the curve of some known satisfactory specimen. It is often sufficient to know the value of the permeability for one value of the magnetising force. In this case the arrangement can be simplified by omitting the resistance and ammeter, and simply arranging for the cells to give one definite current. The divisions on the galvanometer can then be calibrated directly for values of permeability. Commercial forms of the apparatus comprise a wooden case containing a battery of two large dry cells, a reversing key, a plug connected by a long flexible conductor to that key and to

a d'Arsonval ballistic galvanometer marked directly in values of permeability. A space is provided for the plug and necessary drills.

In order to obtain a test the specimen is drilled, the plug inserted, and the key reversed. The pointer then directly indicates the value of the permeability, and if the circuit is then broken and the second reading taken, the value of the retentivity is given by subtracting twice the second reading from the first. In another commercial arrangement a milliammeter and resistance are included. Arrangements of this kind give accuracy within 1 to 2 per cent. They also enable the homogeneity of the casting to be determined from two points of view : (1) by inspection of the place drilled; (2) by comparison of the readings found after testing at different parts. There are very few castings or forgings in which a hole as described would not be admissible, but in the event of such drilling not being allowable a boss can be left on the casting in any convenient position for testing purposes. Care should be taken to have the bottom edge of the aperture in the plug quite sharp, so as to give certainty in the length of the pin used. The magnetising and search coils are wound on an insulated brass bobbin which is split to prevent eddy currents, and screwed to the end of the plug in such a manner as to allow of the yielding due to the slit, the ends of the coils being brought up through the plug. The gap between the search coil and the pin has some influence on the results, owing to the small size of the pin, because the coil cuts both the lines passing through the pin and those in the gap. This effect, though not large, can be allowed for by winding a few turns of wire in the magnetising and search coil circuits together round a bobbin. A reading is first taken by reversing the current without the iron core, then the deflection due to the space may be taken as approximately the square of the ratio of the differences between the diameters of the search coil and pin to that of the search coil, this ratio being multiplied by the deflection referred to above. By adjusting the number of turns in the compensating coil to give this deflection in the opposite direction, the effect of the gap is entirely eliminated.

In cases where a ballistic galvanometer cannot be used, a Wheatstone bridge arrangement is employed, two arms of the bridge including resistances and the other two respectively the magnetising coil and an Ayrton-Perry variable standard of self-induction. In place of the usual bridge battery a source of alternating current, such as a portable generator (or an interrupted battery current), is employed, a telephone being used instead of the ordinary galvanometer. The variable self-inductance is adjusted until no sound occurs in the telephone, showing that balance has been obtained, permeability being then directly read if the instrument has been previously calibrated for that purpose.

QUESTION No. 1,421.

Mr. J. E. Freeman writes us as follows :—"In your issue of December 31st, 1914, is an answer by V. F. Bush to Question No. 1,421, which asked for a method of finding out whether a concentric cable is carrying an alternating current or is 'dead.' Feeling somewhat sceptical as to the practical value of the answer, I have taken the trouble to construct the apparatus mentioned in the reply, and find, much to my surprise, that with a current of about 500 amperes on a lead-covered concentric cable the telephone receiver is absolutely silent. With a single conductor cable this method may be quite satisfactory, but it does not appear to me to answer the problem set by R. McC."

R. McC., who sent us the question, also writes to say that he has found, as stated in our editorial comment, that the search coil method is inconclusive and undependable, and he fears there is no real solution of the difficulty short of cutting the cable.

ANSWER TO CORRESPONDENT

"PUZZLED."—We do not think that it will be practicable to regulate your bus-bar pressure by means of a resistance in the way you suggest. It would be better to employ a regulating switch for varying the number of cells in circuit.

Birmingham and District Electric Club.—The annual report of the Club records an increase of membership, bringing the total to eighty. Six Papers have been read during the session, in addition to the annual dinner and summer visit. Mr. W. G. L. Riddle, formerly Hon. Sec. and now President, is temporarily absent in the Far East, and Mr. N. Deykin is now Hon. Sec. The annual subscription has been reduced from 6s. to 5s. The accounts show a satisfactory increase in the balance in hand.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Dec. 31st, 1914

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

24,871/13. **Variable Candle-power Lamp.** W. G. RHODES. The lamp is provided with two metal filaments of equal size, connected to three terminal plates in the cap, and a special switch is provided in the holder to place in circuit either one filament only, both in series, or both in parallel. (Two figures.)

28,409/13. **Wireless Telegraphy.** F. G. SARGENT. An A.B.C. or dial telegraph system, adapted to wireless working with synchronously revolving multiple contact makers at both ends. (Seven figures.)

28,413/13. **Wireless Telegraphy.** MARCONI'S WIRELESS TELEGRAPH CO., LTD., and H. J. ROUND. A receiving system using an oscillation valve detector consisting of a vacuum tube containing a hot filament, a cylindrical grid completely surrounding the filament, and a third cylindrical electrode completely surrounding the grid. The oscillating circuit is tuned to a frequency slightly different from that of the received wave, and is connected between the filament and the third terminal. The cylindrical form of the grid and third terminal prevents the glass becoming electrified by the cathode stream and producing polarisation effects, and the slight difference in tuning enables signals produced by continuous waves to be heard in the telephone. (Three figures.)

4,590/14. **Focus Lamp.** W. C. M. PETTINGILL. An incandescent lamp for motor-car headlights and other focus work with a special bulb, the spheroidal back surface of which forms a silvered concave reflector directing the light in a beam forwards. The front portion forms an annular reflector of different curvature which throws the light falling on it back on to the first reflector at a suitable angle, and the whole of the light passes out through the clear glass centre of the front of the bulb. (Three figures.)

11,920/14. **Pocket Lamp.** W. J. MELLERSH-JACKSON (*Inter-State Novelty Co., U.S.A.*). A pocket lamp in the form of a pistol with the trigger forming the switch. (Two figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, post free.

Summaries of some of the more important of these Patents will appear in our next issue.

Dynamos, Motors, and Transformers: WARNHOLZ, SPENCER, and WIGMORE [Reversible motors] 341/14; THOMPSON (*Aktiebolaget Jungströms Augturbin*) [Generators with rotary field magnets] 18,258/14.

Heating and Cooking: COOPER [Hot plates] 23,897/13; PATE and WOOD [Boiling plates] 11,996/14.

Ignition: GABELLI [Magneton] 9,104/14; STOCKDALE [Sparking plugs] 13,605/14.

CATALOGUES, PAMPHLETS, &c., RECEIVED

OSRAM LAMPS.—A new leaflet from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), giving prices of standard high- and low-voltage Osram lamps and such special types as special filament round bulb, "axial" and candle lamps, bears a striking reproduction in colour of the company's latest "Leading Light" poster. Another new leaflet deals with British-made Osram half-watt lamps in the 500- and 1,000-watt sizes of which large stocks are in hand. Both these lists can be overprinted with the names and addresses of contractors, dealers, ironmongers, &c.

SHAFT COUPLINGS.—A list from the British Thomson-Houston Co., Ltd. (Rugby), gives full particulars of standard lines of flexible flange couplings, solid flange couplings, and muff couplings. The flexible couplings are of the pin type, with leather washers clamped to the pins.

METAL-FILAMENT LAMPS.—A new series of four advertising cards published by the Edison & Swan United Electric Light Co., Ltd., illustrate, by effective sketches, the uses of the Royal Ediswan drawn-wire lamp in the hall, the dining-room, the kitchen, and the bedroom. These can be overprinted for any of the Company's customers.

Incandescent Lamps: BASTIAN [Manufacture of incandescent lamps] 28,935/13.

Instruments and Meters: BENTON [Indicating instruments] 3,587/14.

Switchgear, Fuses, and Fittings: PERRY [Conduit fittings] 28,854/13; HORTON [Switches] 5,360/14.

Telephony and Telegraphy: SUWA [Telephone systems] 25,720/13; PEDERSEN [High-frequency generators] 28,839/13; EASTERN TELEGRAPH CO., FRASER and WOOD [Perforators] 28,939/13.

Traction: W. R. SYKES INTERLOCKING SIGNAL CO. AND SYKES [Insulating rail joints] 29,260/13.

Miscellaneous: SOC. ANON. DES AUTOMOBILES & CYCLES PEUGEOT [Safety apparatus for lighting installations] 21,445/13. HOLT [Terminals] 28,746/13; WESTERN ELECTRIC CO. (*Woodward for W.E. Co., U.S.A.*) [Terminals] 557/13; VAN DER HOORN and WONDA [Electric safe apparatus] 10,898/14; HITZELBERGER and NEW BRITISH EVER READY CO. [Packing of cells] 17,597/14.

The following Specification is open to Inspection at the Patent Office before Acceptance, but is not yet published for sale.

Ignition: KELLER-DORIAN [Magneton] 23,628/14.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

131/01. **Tumbler Switches.** A. P. LUNDBERG and G. C. LUNDBERG. This is a long specification with 28 figures describing a movable fulcrum system of tumbler switch construction which takes the strain off the springs both in the on and off positions. Details in the construction of the contact arm are also covered, and the combination of a wall plug with a switch of this type is claimed, as well as the use of a slotted nut for locking the cover.

409, 410 & 411/01. **Wireless Telegraphy.** G. MARCONI and MARCONI'S WIRELESS TELEGRAPH CO., LTD. The first of these is for the construction of a receiving transformer with primary and secondary in one winding, the centre turns forming the primary, and the end turns the secondary. The coil is divided into two parts by a condenser. The second specification covers the placing of a resonating system, consisting of a condenser and inductance in series, across the spark jet. The last is for inserting a condenser between the end of the antenna and the terminal of the sparking appliance.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: L. MANNSTAEDT [Conduits] 20,324/02.

Dynamos, Motors, and Transformers: A. M. TAYLOR [System of rectifying] 20,867/09.

Ignition: C. EBNER [Magneton] 19,501/08.

Switchgear, Fuses, and Fittings: F. BROADBENT [Solenoid starters] 20,369/06; B.T.-H. CO. and E. B. WEDMORE [Hand control and tripping gear for oil switches] 20,774/07.

Traction: A. OESTERREICHER and L. NEMELKA [Railway signalling] 19,996/03.

CALENDARS, &c.

The 1915 large sheet calendar of the British Thomson-Houston Co., Ltd. (Rugby), is a handsome production. Each sheet bears not only a large calendar of the current month, but has the useful addition of the preceding and following month on a smaller scale. Some interesting illustrations of plant supplied by the Company are reproduced.

W. T. Henley's Telegraph Works Co., Ltd., have sent us an office calendar with weekly tear-off sheets, decorated with a fine photogravure plate of the Tower of London.

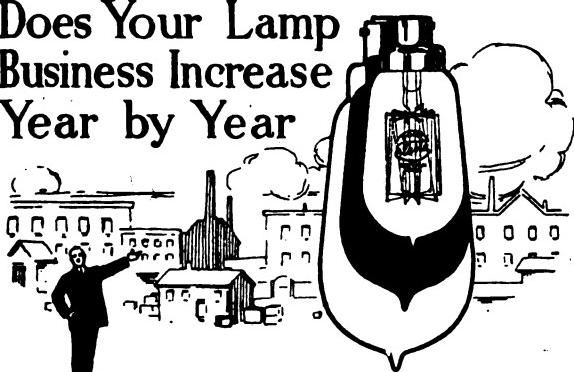

The 1915 calendar which Callender's Cable & Construction Co. are sending to their friends is a very artistic production. It bears a striking reproduction of a photograph of H.M.S. *Queen Mary*.

The Varley Magnet Co. (Woolwich) have kindly sent us one of their office calendars, which is of the large monthly sheet type executed in a harmonious colour scheme.

We have received a boldly printed monthly tear-off calendar from Nalder Bros. & Thompson, Ltd. (97A Dalston Lane, N.E.).

A very patriotic note is struck by the wall calendar of Gillespie & Beales (Amberley House, Norfolk Street, Strand), which is decorated with the flags of our principal Allies and excellent portraits of our King, President Poincaré, the Tsar, and the King of the Belgians, as well as Lord Kitchener, Sir John French, Admiral Jellicoe, and General Joffre. The firm offer to send copies to any of our readers, and the calendar is well worth applying for, if only for the excellent portraits.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Belfast.—The Corporation has at last decided to proceed with the extension scheme at an estimated cost of £28,390.

Bethnal Green.—The Electricity Committee has submitted an estimated cost of £15,944 in connection with the laying of cables and roadwork to deal with the bulk supply from Stepney.

Birmingham.—The Electricity Committee since October has received applications for 11,000 kw., and as the existing stations will be unable to carry this extra load after the present winter, it has been decided to proceed at once with the erection of a temporary generating station pending the completion of the new power station at Nethells. For this purpose a piece of land adjoining the refuse destructor at Nethells has been acquired in order not to interfere with the normal progress on the permanent station. The estimated cost of the temporary plant to be thus installed is £97,300, made up as follows:—Two turbo-alternator sets, including condensers, £38,200; six boilers and stokers without economisers, £25,000; temporary buildings, £4,000; foundations of boilers and turbines, £4,100; coal conveyor, £2,000; three feed pumps, £1,200; piping and valves, £2,500; switchgear, £2,200; generator cables, £600; five cooling towers and foundations, £12,500; sundries, £350; contingencies, £4,650. With the exception of the temporary buildings, all this expenditure is upon plant which will be transferred in due course to the permanent station later.

Darlington.—A scheme for the extension of the generating plant involving an expenditure of £20,000 has been adopted.

Hawarden.—A loan of £5,840 for an electrical installation has been applied for by the Rural District Council.

London: L.C.C.—Two 8,000-kw. turbo-generators with auto-transformers. Jan. 12th. (See advertisement on another page.)

Marylebone.—A sum of £5,524, which is required for additional plant, is to be borrowed from the revenue balance of the undertaking, in view of the fact that at present money cannot be borrowed in the open market at a lower rate of interest than 4½ per cent. It is estimated that a saving of £937 in interest will be made by this action.

Woolwich.—A loan of £32,935 is to be taken up to complete the works recommended by Sir John Snell.

Nottingham.—An expenditure of £20,000 on new mains is proposed.

Salford.—A loan of £18,252 is proposed for a transformer station in Greengate, and £25,000 for H.T. and L.T. mains during the next two years.

South Africa.—The Durban Council is issuing a loan of £350,000 five per cent. registered stock, repayable in 1929, for the purpose of extending the electric lighting, tramway, telephone, and other municipal services.

Tunbridge Wells.—Two water-tube boilers, economisers, mechanical stokers, feed heater, and cooling tower, &c. Borough Electrical Engineer. Jan. 26th.

Worcester.—A loan of £850 is to be taken up for services. The Council is recommended to adopt an all-electric drive for the pumping plant at the sewage works.

Wrexham.—700 yds. of cable are to be laid at an estimated cost of £300.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Ashton-under-Lyne.—School. Architects, Eaton, Son & Cantrall.

Brighton.—School, Loder Road.

Bristol.—Additional hospital accommodation (£7,700).

Eastbourne.—Premises for Prudential Assurance Co.

Eccles.—Bank premises for Williams, Deacon's Bank, Ltd., Manchester.

Hastings.—Fire station, Havelock Road.

London: Camberwell.—Herne Hill Sorting Office. H.M. Office of Works, Storey's Gate, S.W.

Manchester.—Public baths, Chorlton-cum-Hardy.

Newcastle.—Extensions to City hospital (£20,000).

Southampton.—School at Bishopstoke. Architect, L. Roberts, The Castle, Winchester.

Swansea.—Isolation hospital.

Miscellaneous

Australia.—The date for receiving tenders for thirty-four miles of paper-insulated, lead-covered cable, 7,720 yds. of submarine telephone cable, and 8½ knots of submarine telegraph cable has been extended by the Sydney Deputy Postmaster-General until January 15th. Copies of the specifications may be seen at 72 Victoria Street, S.W. This information, of course, is only of value to firms who can cable to agents.

Croydon.—Twelve months' supply of general stores for the Tramways Department. General Manager, Jan. 25th.

Dublin.—Twelve months' supply of electrical goods for the Dublin Port and Docks Board. Secretary, Jan. 13th.

London: Camberwell.—One or three years' supply of electric lamps. Town Clerk. Jan. 18th.

York.—Overhead material for 1½ miles of tramway. Engineer and Manager. Jan. 12th.

been resisted in most towns. At Brighouse the Electricity Committee has been told that unless current is supplied at a price not exceeding 2d. per unit, cinematograph theatres owners will put down their own plant.

East Ham: *Reduced Lighting.*—A suggestion by the Borough Electrical Engineer that arc lamps on hire should not be charged for during the period of enforced non-use in London, under the police regulations, has been adopted by the Electricity Committee on the understanding that these contracts are extended for a period equivalent to the period of enforced non-use.

Glasgow: *Feeder Breakdown.*—At 5 o'clock on Saturday a serious short-circuit occurred on one of the main feeders from the Port Dundas station, and there was in consequence a partial interruption of the supply for about a quarter of an hour.

Southgate: *The L.C.C. Power Bill.*—The *North Middlesex Chronicle*, referring to the copy of the Draft Bill relating to the supply of electricity in London which has been received from the London County Council, somewhat picturesquely states that the local Council received the proposal "with menacing growls and condemned it by implication."

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £60 15s. to £61 5s. (Last week, £60 10s. to £61.)

Canadian Agency.—A firm in Vancouver, B.C., desires to represent United Kingdom manufacturers of electrical goods. Further particulars at 73 Basinghall Street, E.C.

Liquidation.—Redglo, Ltd., is to be wound up voluntarily. Mr. E. J. Walker, 5 Castle Street, Liverpool, and Mr. P. Hutchison, 89 Chancery Lane, Ardwick, Manchester, are liquidators.

APPOINTMENTS AND PERSONAL NOTES

A station superintendent is to be appointed by the Maidenhead Electricity Committee at a commencing salary of £175 per annum.

Particulars are given in our advertisement columns of vacancies for temporary switchboard attendants, a shift engineer at Birmingham, a fitter-driver at Stafford, and a switchboard attendant for the Mersey Railway Co. A switchgear draughtsman and wireman are also required.

Mr. John Cowan, founder of the Stirling Boiler Co., has received a knighthood. Mr. E. G. Constantine has resigned his position as managing director of this Company, but remains on the Board. He is succeeded by Mr. H. J. S. Mackay.

LOCAL NOTES

Accrington: New Gas Plant.—The new gas-driven generating plant is now in operation, but the trial on the gas cleaning and sulphate plant has necessitated some minor alterations. The coal fuel cost of the new plant has been 0·273d. per unit, against 0·379d. per unit with the steam plant.

Brighouse: Supply to Cinemas.—In Brighouse, as in other parts of the country, a dispute has arisen between owners of cinematograph theatres and electric supply authorities as to the price at which current for use in the apparatus should be supplied. The general claim is that such current should be charged for at power rates, but this point of view has

Divisional Engineers—Royal Naval Division.—The Institution of Electrical Engineers is informed that it has been decided to form another Field Company of Engineers for the Royal Naval Division. It is desired that at least two sections of the new Company should consist of highly-trained men, and applications are accordingly invited from members of the Institution between the ages of nineteen and thirty-five. It is understood that the rates of pay and the duties are the same as those of the Royal Engineers. Applications should be addressed to Captain Harrison, Adjutant, Divisional Engineers, R.N.D., 2 The Downs, Dover Road, Walmer. It will be remembered that the Engineer Units of the Division consist largely of members of the Institutions of Civil, Electrical, and Mechanical Engineers. Nearly 100 of those who joined these Units since they were formed last September have received commissions in the Army.

The Future of London's Electricity Supply.—The Marylebone Electricity Committee has presented a long report in which it outlines the features of the London County Council's Electric Supply Bill, and concludes by recommending that a petition be deposited against it and also against the No. 2 Bill, in which it is proposed to incorporate a new power company for London. Important reports have been prepared upon the position generally by the General Manager of the Council's undertaking (Mr. A. H. Seabrook), and by the Council's Parliamentary Agents, but it is not proposed to circulate these reports at the present time. It is stated, however, that although conferences have been held with the Chairman and Vice-Chairman of the L.C.C. Electricity Committee and with Mr. C. H. Merz (the Council's consulting engineer), it has not yet been found possible to obtain the specific information required in order to answer the three questions which have been placed before the authorities concerned by the L.C.C., namely, as to whether the Council is in favour of the establishment of a more uniform supply of electricity; whether it is in favour of a central bulk supply undertaking; and whether it will support the L.C.C. Bill.

The Standing Conference of Metropolitan municipal electricity undertakings has passed a resolution against the L.C.C. scheme.

Lundberg's Electric-light Switching Competition.—We would remind those competitors who have not yet sent in their answer papers that the latest date for their receipt (except those from far countries) is Monday next, January 11th. Papers should be addressed to the Editor of ELECTRICAL ENGINEERING, 203 Temple Chambers, London, E.C., and not to Messrs. A. P. Lundberg & Sons direct. For far-off competitors the date is June 1st.

Obituary.—The death of Mr. J. F. Albright, which we regret to have to record, removes one of the pioneers of the electrical industry. Mr. Albright, who was in his fifty-seventh year, was closely connected with the early Edison and Swan Companies before the amalgamation into the present Edison & Swan United Electric Light Co., and, later, was on the board of Crompton & Co. He was afterwards managing director of the Drake & Gorham Electric Power Co., but his activities were by no means confined to these undertakings, as he was responsible for many other electric supply schemes, both at home and abroad. He was also interested in a large number of other companies.

The Enemy's Trade.—The seventh of the Exchange Meetings organised by the Commercial Intelligence Branch of the Board of Trade with the object of assisting British manufacturers to capture trade hitherto in the hands of Germany and Austria-Hungary will be held at 32 Cheapside, E.C., on Thursday and Friday, January 7th and 8th. This meeting will be devoted to the Electrical Accessories Trade. British manufacturers and representatives of wholesale houses who previously imported such goods from Germany and Austria-Hungary are invited to be present and to inspect the samples of German and Austro-Hungarian goods which will be on view.

SUMMARY

SOME practical and useful notes in connection with house-wiring are given in a paper by C. J. Banister and C. R. Bates (p. 12).

A QUESTION has arisen as to the legality of charging for current for photo-printing at power rates. The Secretary of the I.M.E.A. holds strongly that it is allowable (p. 12).

AN interesting exhibition of German-made electrical goods was held under the auspices of the Board of Trade last week, to bring British manufacturers in touch with dealers who have previously bought these articles from Germany (p. 13).

WE give particulars of the law cases of electrical interest which are down for hearing during the Hilary Law Sittings which opened on Monday. An interesting appeal relates to the liability of consulting engineers (p. 13).

IN a paper read before the Society of Chemical Industry, Mr. E. Kilburn Scott described his experimental three-phase furnace for the production of nitrates from the air (p. 14).

THE causes of lack of balance in a compensator three-wire system are discussed in our "Questions and Answers" columns (p. 15).

AMONG the subjects of specifications published by the Patent Office last Thursday are an improved

system for generating continuous waves for wireless telegraphy, employing several arcs, by P. O. Pedersen. A tungsten filament lamp with fused silica bulb is also described by C. O. Bastian. Other specifications deal with conduit fittings and telephone working (p. 16).

WE give a description of a Marconi wireless station on the Straits of Magellan (p. 16).

ONE person was killed and a number rendered unconscious by smoke in an accident on one of the New York electric underground railways. The Board of Trade has intimated that it will not support the objection raised to the overhead trolley system on the L.C.C. trams in Stepney (p. 17).

OUR Trade Section contains illustrated articles on a new wiring conduit, an ironclad switch, indirect lighting fittings, a house service box, and a half-watt street lantern (pp. 17-19).

MAINS, services, motors, and transformers are required at York; generating plant at Limerick (£5,000); services and mains at Manchester (£20,000); a battery at Clacton; and electric lighting schemes are to be proceeded with at Waterford and Holmfirth (p. 19).

OWING to shortage of labour at Newport (Mon.) higher wages have had to be offered.—The Mayor of Doncaster, as Chairman of the local Tradesmen's Association, is strongly opposed to the municipal wiring clauses in the Corporation's Bill (p. 20).

Arrangements for the Week.—(To-day) Thursday, Jan. 14th.—Institution of Electrical Engineers. "The Shape of the Pressure Wave in Electrical Machinery," by Dr. S. P. Smith and R. S. H. Boulding, 8 p.m.

Monday, Jan. 18th.—Institution of P.O. Electrical Engineers, at I.E.E. Victoria Embankment. "Telephone Relays and their Application to Commercial Circuits," by C. Robinson, 6 p.m.

Institution of Electrical Engineers, Newcastle Section, at Mining Institute. "Automatic Protective Gear for Alternating Current Systems," by E. B. Wedmore, 7.30 p.m.

Junior Institution of Engineers, N.W. Section, 26 Corporation Street, Birmingham. "Country House Electric Lighting Installations," by C. F. Clifton, 7.45 p.m.

Tuesday, Jan. 19th.—Association of Supervising Electricians, St. Bride's Institute, Fleet Street, E.C. Informal discussion, 8 p.m.

Illuminating Engineering Society, at Royal Society of Arts. Discussion on "Some Points in Connection with the Scientific Development of Practical Applications of Searchlights," 8 p.m.

Thursday, Jan. 21st.—Greenock Electrical Society, 21 West Stewart Street, Greenock. "Electricity in a Shipbuilding Yard," by Duncan Angus, 7.45 p.m.

Saturday, Jan. 23rd.—Association of Mining Electrical Engineers, West of Scotland Branch, Royal Technical College, Glasgow. Joint meeting with National Association of Colliery Managers. "Electricity at the Coal Face," by John Bowman, 4.50 p.m.

SOME NOTES ON HOUSE-WIRING

A PRACTICAL Paper on "Wiring Systems" was read by Messrs. C. J. Banister and C. R. Bates before the Association of Supervising Electricians last month. In the introductory part of the Paper they allude to the fact that, in conduit wiring, faults are more prevalent than in casing work, and that the insulation test is more frequently low. Another advantage of casing is that, with good work, faults are practically unknown, and, owing to the absence of condensation, the life of the wires is longer. They point out, however, that to comply with the Wiring Rules of the Institution of Electrical Engineers, casing must only be used on the surface, and where some parts of the wiring have to be buried they recommend that one of the metal-covered cable systems should be used for these portions, rather than isolated lengths of steel, porcelain, or "compo" tubes. At points where the casing passes through floors they suggest that sheet-lead or zinc should be dressed round the casing to protect it from being wetted during floor-washing. The casing throughout the job should have ample thickness at the bottom, the centre fillet should be at least $\frac{1}{8}$ in. wide, and the capping should be at least $\frac{1}{8}$ in. thick, and should be fixed with screws or other fixings which will not rust or corrode.

In their remarks on conduit work, stress is placed on the importance of good enamelling of the tubes; the elastic and acid-proof enamel used by the better-class makers withstands the handling in erection much better than the cheaper japan used with inferior quality tubing. When moisture is present, galvanised or Sheradised tube is recommended—preferably the latter. For bending, a simple wooden bending block will give splendid results in the hands of a highly-skilled workman. There are, however, various bending machines in use, and the authors say that probably the best is the Kennedy bender, by which it is possible to form almost any bend, even with the light-gauge close-joint tube. The use of a bender ensures uniformity, and often effects a great saving in labour on a job.

No less than nine continuity devices for slip tubes are described in the Paper: (1) The pin grip system consists of a steel pin driven into a slot in the fitting, but the authors fear that there is too much risk of bad contact, as the enamel must be thoroughly removed both from the interior of the fitting and the outside of the tubing. If, after scraping the tube and fitting, a coating of metallic paint is added, they say that a fairly good connection is made which is reasonably permanent if carried out by a conscientious and skilful mechanic.

(2) The screwed grip nipple entails the use of a screwed fitting one size larger than the tube employed, with, therefore, less chance of the wires being damaged when drawing in. The use of a hexagonal head to the nipple is an advantage.

(3) In the Wallsall grip (quite recently referred to in our columns in connection with a patent action) the ends of the fitting are split, and the grip is obtained by a small pinching screw at each outlet. It is all in one piece, for the screw need never be removed; and the contact is good, as the machining of the interior surface is the last operation in manufacture, and the fittings are brush-enamelled, and not dipped. It is intended in future to make the fittings with a shallow thread which will cut into the enamel of the tube when the grip is tightened.

(4) The "Demon" grip has a screw which is turned after the tube is inserted, and the threads cut their way across the side of the tube.

(5) The "Grip-tite" is a split fitting with a saw-cut at the side of the lugs to give a better grip.

(6) The Credenda sleeve grip consists of a milled sleeve having a slight collar at one end; it has no screws, and need only be tapped home in the fitting (which need not be threaded).

(7) The "Perfecta" fittings have a small box at each outlet through which a set screw passes.

(8) In the Credenda spring grip a coiled steel spring fits over the tube and fitting; in turning the tube to get it home the enamel is scraped off.

(9) In the Eccentric continuity grip, just introduced, the fitting is bored eccentrically, as is also the nipple. The latter fits over the tube and inside the bore of the fitting, and by turning it the whole is tightened up and the contact surfaces cleaned by a rubbing contact. Neither the nipple nor the fitting are threaded.

For screwed conduit work the authors insert a draw-box at least every 25 ft. or 30 ft. on straight runs, and provide inspection fittings where there are two or more bends in

the tubing. Especially for damp situations the system with outlet or junction boxes throughout is preferred to one with the outlets at switches and crosses being made at a wooden block with some method of bonding the tube across it. Of late, the authors complain, the tendency has been to produce junction and inspection fittings with openings far too small to be of practical service. A description is given in the Paper of the latest forms of useful adjustable switch-boxes for use with sunk switches having covers flush with the walls. The ceiling rose box with terminals inside is preferred to the use of an ordinary box with fibre lid upon which the ceiling rose is mounted; and ceiling boxes with two or more back outlets are mentioned as being useful to make drawing-in easy when, for instance, the tubes run in the roof space of a new building. The new tube with screwed sockets (described on another page of this issue) was also mentioned.

When large cable is employed, e.g., 37/16, the authors point out that the usual types of inspection boxes and fittings are quite unsuitable for drawing in, and a split fitting only partly overcomes the difficulty, as it is not rigid when fixed. A large draw-in box with a plain normal bend is preferable to an inspection bend in this case. The best way out of the difficulty, in the authors' opinion, is to use armoured cable for these heavy cables instead of tubing. Architects are criticised for not affording sufficient provision for the electrical work, and it is pointed out that much cutting away and making good could be avoided by leaving channels in the floors communicating with vertical ducts in suitable positions. In this connection the revolutionary suggestion is made that such channels should be employed to carry bare copper conductors on insulators. As larger cables on medium-pressure systems, and all cables on high-voltage systems, are usually run on insulators and not in tubing, the authors think that the prejudice against wiring on insulators for low pressures is unreasonable.

The Paper then describes in detail the Kalkos, Stannos, Henley, and Cab Tyre wiring systems, and concludes with a consideration of the various types of fixings. Among these mention is made of the "Rawl" plug, a new plug consisting of a bundle of fibre strings laid together and stiffened with glue, to form a tube. The wood screw splits the fibres longitudinally and forces them against the walls of the hole, thus automatically forming a thread.

CHARGING FOR CURRENT FOR PHOTO-PRINTING

IN a recent issue of the *Municipal Journal* an inquiry from the Chairman of an Electricity Committee is published, asking whether it is illegal to supply current at power rate for photo-printing. That Journal agrees with the Town Clerk of the undertaking in question that such a practice is illegal, on the ground that the current is for lighting and not power. Mr. H. Faraday Procter, Hon. Sec. of the I.M.E.A., writes to us protesting emphatically against such a ruling. It must be remembered, writes Mr. Procter, that electrical undertakers do not sell either light, heat, or power. Their commodity is electrical energy, and when such energy is used for photo-printing it is not used as an illuminant, but for its actinic properties—a purely commercial use—and may certainly, therefore, be sold as power. If the argument held good that electricity used for photo-printing must be considered lighting and sold as such, then all luminous radiators would come under a similar ruling. The ultimate purpose for which energy is used must be taken into consideration in determining whether such use is lighting, power, or heating, and a moment's consideration will make this clear. In all electric lighting the energy is used primarily to heat the carbons or filaments in the lamps to such a temperature that they produce light, but would anyone suggest that all such energy must be sold at the heating rate, the natural corollary would be the abolition of all lighting rates.

Electric Lighting Provisional Orders.—Thirty-one applications have been made to the Board of Trade for electric lighting provisional orders, and these will come before Parliament in the usual manner next session. Of these, 20 are promoted by local authorities, seven by companies, and four by individuals. Competing orders are being promoted at Knaresborough by the Council and by the Harrogate Corporation, and in several other cases the orders are for extensions of area by existing supply authorities, including Tunbridge Wells, Warrington, Keighley, and Southampton.

WHERE THE GERMANS HAVE BEATEN US

Board of Trade Assistance

IMMEDIATELY after the outbreak of the war we published in our issue of August 13th a detailed statement with regard to Germany's electrical export trade, giving the quantities of electrical apparatus of the various classes which this country had bought from Germany in the preceding year. Our urgent appeal to manufacturers to take steps to derive the utmost benefit from the new field open to them has borne some fruit; but, especially in the smaller and lighter classes of electrical supplies, the purchases of which from Germany have been enormous in recent years, the manufacturers have for the most part been content to take matters slowly and to limit their activities chiefly to their standard products. It is no doubt excellent policy to educate the buying public to demand these, but more than this is needed if the trade in the cheaper grades of articles is not to return to Germany after the war is over.

The Board of Trade did useful work, therefore, in holding an exhibition in London, last Thursday and Friday, of electrical goods which have been bought largely from Germany in the past. Wholesale suppliers and large buyers were asked to send in samples of these with nett prices and other particulars; these samples were exhibited, and manufacturers were invited to inspect them. Any manufacturer who already made similar articles, or thought that he was in a position to do so, was invited to the inquiry office, where he was furnished with the name and address of the exhibiting wholesaler, and such other information as was available. Buyers and factors also visited the exhibition, and in some cases, we believe, orders were actually placed on the spot.

The number of articles was not great, and the whole exhibition was easily displayed in one room of fairly large dimensions; but, taken as a whole, the exhibits were fairly representative. The articles displayed to the greatest extent were switches, ceiling roses, lamp-holders, and similar accessories. Most of these had evidently been made for the British market, and, speaking generally, the porcelain bases and covers were of poor glaze and finish, but the metal-work was not by any means of such bad finish that a British manufacturer need be ashamed to imitate it for his second-grade products. There were some exceptions, of course; but these had mostly been selected by exhibitors to show in what respects some of the cheapest German goods were inferior. The prices were certainly low, sometimes almost absurdly low; but it must be remembered that the prices were those for which the articles were bought before the war, and both now and afterwards buyers will be prepared to pay higher figures. Thus there were bridge-type ceiling roses, quite good except for the finish of the porcelain, priced at 18s. a gross. We were informed by a porcelain manufacturer that the reason that the cost of these is so low in Germany is not that the machines are more efficient or their output more rapid, but simply that the workers and apprentices were paid much lower wages, while the freight of China clay from Cornwall was no greater to Germany than to the Midlands. Tumbler switches, some priced as low as 7s. 5d. per dozen, were of qualities for which the Germans have certainly found a good market in this country. Some all-porcelain switches of the Continental pattern with grooves in the bases for side entry of the wires, and also lamp-holders with "Edison" sockets, proved that these had been frequently bought here in quantities for re-export to the Colonies and abroad. There were lamp-holders, some fairly good and others very bad; key lamp-holders complete with cord grips had been bought at 6s. to 7s. per dozen, and we were informed by the representative of one large British manufacturer that he could certainly turn out a good second-grade quality at prices approaching to this. Wood blocks were also exhibited; surely it should have been unnecessary to buy these abroad.

The bell-pushes were certainly cheap and nasty; some porcelain pushes were actually marked at 15s. 8d. per hundred, and wooden ones from 6s. 10d. per gross. As for the bells themselves, their most noticeable characteristics, besides cheapness, were the extremely good external polish and finish of the common deal bases and covers, and the abominable nickel-plating of the gongs. A few bell indicators were shown, low-priced and with bad woodwork.

The British Post Office had sent some German telephones and miscellaneous ebonite parts, and also two cards of glass caps for exchange indicator lamps. A case contained Crookes tubes, vacuum tubes, and chemical glass-ware, of

which a large proportion has always come from Germany. Needless to say, there were glass and enamelled iron shades, and also hoods for lanterns, arc-lamp carbons, and insulated cables and wires. A pair of rubber gloves, somewhat the worse for having been in stock for some time, lay neglected in a corner. Meters of well-known German makes were on view, and a collection of small motors and fans, a few electric irons, and immersion heaters. A number of extremely cheap toy motors attracted much attention; apparently there is a market for these, but British manufacturers, probably rightly, have not thought it worth their while to turn their attention to them. On the other hand, a tiny "shocking" magneto was on view, which, although an imitation of a German make, had, we were told, been made by a British manufacturer and sent in error—a mistake which, we understand, proved profitable to the maker. A few, but by no means representative, specimens of useful electro-medical apparatus had been sent, and it is to be hoped that such things will soon be made in larger quantities here. It is, for instance, practically impossible now to obtain such necessary apparatus as cystoscopes, as these have been a German speciality.

We trust that this small exhibition will have done some good, but both from the number of exhibitors and the number of manufacturers who visited it, it is evident that it has merely opened the way, and that it rests with our electrical manufacturers themselves to take further action. It is obvious that many dealers who have hitherto bought their cheaper lines largely from Germany do not care to make this too widely known, and although the Board of Trade scheme was a good one, its value should chiefly be in the stimulus it may give to manufacturers themselves. They must know intimately the patterns, qualities, and prices of the German goods which have been bought instead of theirs, and now that trade is a little more settled they should be able to gauge the demand as well. They should now take the initiative, and advertise at once (preferably with prices) the equivalent articles which they already manufacture, and they should advertise also for inquiries for those which they have hitherto not thought it worth while to produce. The field should be particularly good in smaller fittings and accessories; there are many makers of these who are none too busy at present, and the difficulty of obtaining porcelain, although a real one, is not insuperable—at a pinch it must not be forgotten that another material can be used as a substitute, or they might even learn how to make the small special porcelain parts themselves if the porcelain manufacturers cannot meet the emergency.

PENDING ELECTRICAL LAWSUITS

DURING the Hilary Law Sittings, which commenced on Monday, the Walsall Hardware Co. will appeal against the judgment of Mr. Justice Joyce, who held that the split grip conduit fittings made by the Stella Conduit Co. are not an infringement of their patents. The action was reported in ELECTRICAL ENGINEERING of Oct. 27th, p. 560, and Nov. 19th, p. 598. Another appeal of interest is by Messrs. Kirkland and Capper and J. H. T. Wood, in regard to the liability of consulting electrical engineers. The action in question concerned the wiring of the Medical Staff College and Laboratories at Millbank for the War Office, and was dealt with in our issues of April 23rd, p. 224, and May 14th, p. 267, 1914. There is also to be an appeal on a preliminary point in the B.T.-H. v. Duram metal-filament patent case; the case itself will not come on until after Easter.

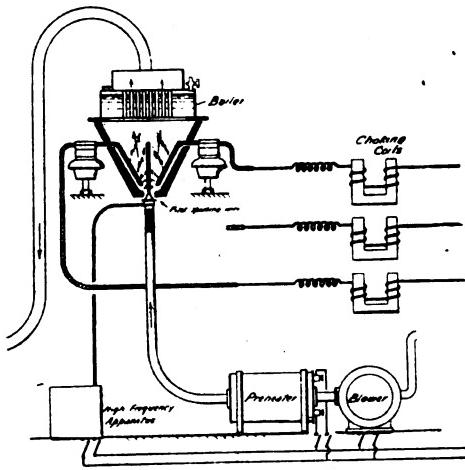

In the Chancery Division the metal-filament patent infringement actions by the Osram Lamp Works, Ltd., against Pope's Electric Lamp Works, Ltd., and the Corona Lamp Works, Ltd. (of which particulars were given on p. 545 of our issue of Oct. 15th, 1914), are down for hearing before Mr. Justice Eve and Mr. Justice Warrington respectively, instead of as originally allocated before Mr. Justice Joyce and Mr. Justice Sargent. Similarly, the application for a compulsory licence under the drawn-wire metal-filament lamp patents by the Robin Electric Lamp Co., dealt with in detail in our issue mentioned above, is transferred from Mr. Justice Sargent to Mr. Justice Warrington. Early on Mr. Justice Sargent's list is the Ilford preferential charging action. The dispute between the Beck and Foster Engineering Companies over the carbons which formed the subject of police court proceedings in September is now transferred to Mr. Justice Eve in the Chancery Division.

ELECTRICAL PRODUCTION OF NITRATES

A meeting of the Society of Chemical Industry, held on Jan. 4th at the Northampton Polytechnic Institute, Mr. E. Kilburn Scott read a Paper on the Production of Nitrates from Air, illustrated by experiments. The subject was one of considerable importance in view of the fact that nitric acid was used extensively in the manufacture of explosives both for mining and war purposes. It was notable that the Germans were to some extent independent of imported nitrates in this respect, on account of the electrical nitrate factories of the Badische Anilin & Soda Fabrik. There was also another large factory in Norway which was, however chiefly controlled by Scandinavian and French interests.

All nitrogen fixation furnaces have electrodes of metal between which alternating-current arcs are formed. These arcs are "blown" into flames by a magnetic field or an air blast, and provision is made for the passage of large quantities of air through these flames. Owing to the great heat of the electric arc, and possibly also to electronisation, some of the air is acted upon and the nitrogen and oxygen combine to form nitric oxide. As this gas dissociates unless it is immediately cooled, it is necessary to provide a cooling zone in close proximity to the flames and arrange for the gas to enter that as quickly as possible.

Mr. Kilburn Scott proceeded to describe the Birkeland and Eyde furnace (see ELECTRICAL ENGINEERING, Vol. V., p. 515, June 3rd, 1909), of which thirty-two of from 600 to 1,000 kw. each are in use at Notodden and eight of 3,500 kw. at Saaheim, in Norway. In this furnace a single-phase arc is flowed outwards in a disc-shaped chamber by the action of a very powerful magnet energised by continuous current, so

EXPERIMENTAL NITROGEN FURNACE.

that a circular sheet of flame is produced through which the air is passed by suitable channels. The tube furnace of Schönherr and Hessberger (also described in the article referred to) is used at the Christiansand works of the Badische Anilin & Soda Fabrik, and also at Saaheim. In this a single-phase arc is blown up a tube by a whirling current of air introduced through tangential orifices. Although simpler than the Birkeland and Eyde furnace in that it employs only one kind of current, it cannot be built in such large sizes on account of the excessive length of tube required, which for 1,000 kw. is already 20 ft. long.

The Pauling furnace used at nitric acid factories at Gelsenkirchen, Innsbruck, and Milan, also at Roche de Rame, France, and in South Carolina, U.S.A., is built on the lines of a horn-type arrester—that is to say, it has two electrodes which diverge so as to give a fan-shaped space between them. It differs from a lightning or surge arrester, however, in having an air blast which has the effect of filling the fan-shaped space with flame. The electrodes are set several inches apart to allow the air supply to pass through, and from each electrode there projects a starting or kindling knife of thin copper set on edge so as to obstruct the air as little as possible. These kindling knives are approached to within about 3 millimetres of each other, and as they burn away are fed forward by a rack behind. The kindling knife passes through the bottom horizontal bar of the main electrode.

The author on the whole prefers the air-blown arc furnace of the Pauling type, but this, in common with the others described, suffers from the disadvantage of being unable to work with three-phase current. His own furnace, which has been developed on a laboratory scale at the Northampton

Polytechnic, employs three-phase current at 2,000 volts 25 cycles.

The three electrodes of the furnace are attached to double petticoat porcelain insulators spaced 120° apart. They are of steel rod $\frac{1}{4}$ -in. diameter, and the inclined sides are bent at about 30° from the vertical line. The rods pass through holes drilled in a standard fireclay crucible which serves as the wall of the furnace. The bottom of the crucible is also drilled through, and immediately beneath is the air-supply pipe. The upper portion of the pipe is made of insulation material and a No. 18 gauge iron wire is attached to the nozzle so as to project vertically upwards with its point midway between the three electrodes and just below them. This wire is for the pilot sparks, and it is connected to a high-frequency, high-voltage apparatus somewhat similar to apparatus used in wireless working, which produces a stream of high-tension sparks from the wire to the electrodes which break down the air, and the main three-phase current can then follow. The bottom ends of the main electrodes are set about $\frac{1}{4}$ in. apart, so as to allow the air to pass freely, and they do not require any adjustment because the pilot sparks always make a path for the main current to get across. The essential parts of the experimental furnace are indicated in the figure.

Air is supplied by a motor-driven blower through a pre-heater, and the top of the apparatus forms a boiler which cools the gases and enables some of the waste heat to be recovered. Designs were shown for a full-sized commercial furnace with water-cooled electrodes, and the method of working proposed includes using the steam from the boiler in a mixed-pressure turbine, whereby a gain of 15 per cent. in economy is expected, and the enrichment of the air by addition of oxygen before it passes to the furnace. After passing through all the absorption system the oxygenated air would not be allowed to escape into the atmosphere, but would be brought back to the furnace. If it were allowed to escape there would, of course, be great waste of oxygen, but by working in a closed cycle only make-up oxygen would be required, and therefore a small oxygen plant would do. The ideal condition, says the author, would be obtained by linking-up the nitric acid factory with an industrial process which gives off oxygen as a by-product. There are several such industries. The first is the manufacture of hydrogen for aircraft, the second the manufacture of calcium cyanamide. A third is one method of manufacturing sodium cyanide, and a fourth is the manufacture of hydrogen for increasing the density of oils for margarine, &c.

The arrangements proposed for dealing with the product and for making ammonium nitrate from it are detailed in the Paper. The average yield of existing furnaces is given as half a ton of 96 per cent. pure nitric acid per kw.-year, and Mr. Scott expects an additional gain of 15 per cent. due to recovery of waste heat by the boiler, a further gain of 20 per cent. in economy by working with oxygenated air on a closed cycle, and looks forward to a gain of as much as 30 per cent. due to the higher temperature attained in his form of three-phase arc.

Foreign Motor Dictionaries for the Front.—The Commercial Motor Users Association has presented to the British Red Cross Society, the French Red Cross Society, the Army Service Corps, the Royal Naval Division, and the Recruiting Authorities, several thousand copies of a handy pocket motor dictionary, printed in English, French, and German, for the use of the motor transport drivers on active service on the Continent. The booklet, which is of a size suitable for the waistcoat pocket, comprises twelve pages, and contains 500 words referring to the construction and running of a motor vehicle. There are still a few copies of the dictionary available, and anyone interested may obtain a copy by forwarding a 1d. stamp to cover postage, to Mr. F. G. Bristow, Secretary, The Commercial Motor Users' Association (Inc.), 83 Pall Mall, London, S.W.

The Belgian Chamber of Commerce.—The Belgian Chamber of Commerce in London (Incorporated), appeals to the British manufacturers and merchants for support. It has rendered valuable services since 1890 to industries and commerce between the two countries, and since the beginning of the war its task has become much more arduous. After the cessation of hostilities it will have important duties to perform in helping the commerce of the two countries by bringing together manufacturers and buyers of goods, and in other ways. Difficulties are found in carrying out these duties through lack of funds, as Belgian supporters are unable now to send their usual remittances. Applications for membership and contributions to be sent to the General Secretary: Mr. P. Dorchy, 24 St. Dunstan's Buildings, St. Dunstan's Hill, E.C.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

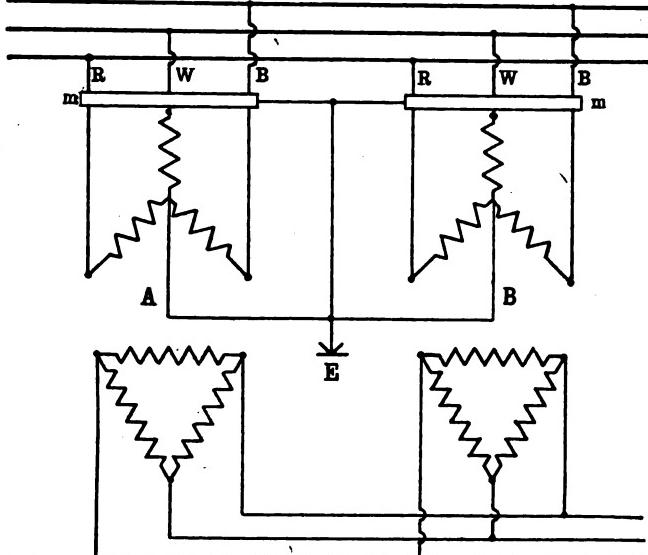

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

QUESTION No. 1,425.

A number of three-phase, 25-cycle induction motors are connected to three bus-bars supplied from two 200 k.v.a. transformers at 400 volts between phases. Each transformer is provided with a four-wire watt-hour meter, the two potential coils in each case being connected between two of the phase wires,

A.B. TRANSFORMERS. M.M. WATT-HOUR METERS.

and the neutral point of the system, which is earthed. It was desired to check the relative loading of the transformers by simultaneous readings. The only instruments available were two indicating watt-meters, and these were inserted in turn in the phase wires, as shown in the figure. The results obtained were as follows:—

| Trans-former. | Current Coil in Phase. | Potential Coil between Phases. | Watt-meter between Neutral and Phase. | | Watt-meter Reading. |
|---------------|------------------------|--------------------------------|---------------------------------------|---------------------|---------------------|
| | | | Reading. | Watt-meter Reading. | |
| A | R | R-W | 140' | R | 25 |
| B | R | R-W | 55 | R | 80 |
| A | W | W-R | 180 | W | 80 |
| B | W | W-R | 185 | W | 90 |
| A | B | B-W | 130 | B | 110 |
| B | B | B-W | 200 | B | 85 |

It should be noted that while each pair of readings was taken simultaneously, the observations of one phase are not comparable with those of another as the load may have altered meanwhile. What is the explanation of the wide variation in the relative values of the simultaneous indications which were obtained?—J. E. F.

(Answers must be received not later than first post Thursday, Jan. 21st.)

ANSWERS TO No. 1,423.

In each of two four-pole direct current generators, fitted with four interpoles and three slip-rings for connecting to a three-phase static balancer, the voltage on the two sides of the system differs by about 3 per cent. when the load is balanced (as current in the middle wire), and the brushes are in the neutral position. The series and commutating pole windings are connected one-half on each side of the armature, and the drop of volts across each set is the same. The voltage between each pair of slip-rings is equal.

Explain the cause of the unbalanced voltage, and suggest remedy.—KoIL

The first award (10s.) is made to "M. M.," whose reply is given in slightly abbreviated form below:—

It is evident that the difference in voltage must be due to want of symmetry in some part of the plant. As there is no current flowing in the middle wire, there will be no difference of potential in that wire between the load and the point of connection to the choker. Therefore, with a difference of voltage between the two sides it would appear that the "neutral" point of the choker is not at the mean potential. Although there is no current flowing in the neutral wire there may be an appreciable current circulating in the mesh-connected armature winding by way of the slip rings and the choking coil. These circulating currents may so upset the equilibrium as to cause the noted difference of voltage. Altering the points of connection to the armature winding might improve matters, but would be rather difficult. Again, if the armature coils are unsymmetrically placed it would be almost impossible to re-arrange them. Any want of symmetry should be evident by taking voltages between the slip rings when machine was unloaded. Perhaps the simplest method would be to arrange the load with a certain out of balance in order to help matters, but this would not be a very scientific procedure. If the trouble is due to shape or strengths of pole-pieces, alteration would be a serious matter. The fact that both machines give a similar result leads one to suppose that the fault is due to construction or rather design. Note whether the armatures are concentric with the poles, if not, this can be remedied. If they are concentric, improvement might be effected by setting one armature slightly eccentric by packing up the bearings. To find out whether the trouble is due to excessive circulating currents a machine could be run for definite times with and without the choker in circuit; other things being equal. An idea of the value of any circulating currents could then be obtained by finding temperature of the armature windings.

The second award (5s.) is made to "E. P. H.," whose reply is given below in abbreviated form:—

The source of trouble is probably some difference in reactance between the two sets of balancing transformers. It is in practice found not to be wise to run these in parallel unless the plant is under careful supervision, and for the majority of cases one transformer will meet the usual out-of-balance load. If the trouble occurs only when both sets are in parallel, then the trouble is in transformers as above or is due to the frequency, i.e., the speed of the two sets not being identical. The condition of the slip-rings should be noticed, as, if some rings are out of truth, a large voltage-drop may occur here.

There is again (in the case of new plant) the possibility of tappings being made incorrectly in armature, or not identical tappings in the two machines. The mid-wire ammeter upon which the out-of-balance load has been read being a centre zero meter, it would be well to see that this has not a bent pointer. The temporary inserting of an ammeter (*AC*) in the balancing transformer mains to check the balance would throw some light on the trouble.

ANSWERS TO CORRESPONDENTS

F. J. H.—The active material of box-type negative battery plates is usually made from pellets containing litharge mixed with some expanding material, such as lampblack dropped into place in the openings in the plate, and covered with sheets of perforated lead. You will find further information on this subject in "Storage Batteries," by H. W. Morse, a copy of which we can supply you with for 6s. 10d., post free.

L.G.—The relative merits of geared turbo-generators, and turbo-alternators used with rotary converters for giving D.C. supply where the size of unit renders direct-coupled D.C. turbo-generators unsatisfactory, depends upon conditions varying in each case. The matter was referred to in ELECTRICAL ENGINEERING, May 21st, 1914, page 227, and June 11th, page 523.

C. G.—The number of cycles per second of the magnetisation of the iron in any limb of a polyphase transformer is the same as the frequency of the supply. However many phases the generator is wound to give, the frequency in each phase is the same as if the generator were wound for single phase, although the maxima in each phase occur successively during each cycle.

H. TAYLOR.—As you will know upon which circuit the "short" is by the blown fuse on the distribution board, divide the circuit at one of the fittings and switches where the wires are looped-in, and test with a bell and battery to see on which side the short is. Go on dividing up in this way until the short is found.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Jan. 7th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

25,720/13. **Telephony.** M. SUWA. A telephone system comprising a circuit wherein the batteries are included in independent transmitter circuits, each connected to the main line through a transformer when the receiver is removed, but are included in the main line circuit and rendered inoperative by the potential balance of the batteries when the receivers are on their hooks. (Three figures.)

28,839/13. **Wireless Telegraphy.** P. O. PEDERSEN. Improvements in the Poulsen arc system of continuous wave production, wherein several arcs which become active in succession are inserted in series or in parallel in the oscillation circuit, each single arc being passed by current impulses, corresponding to one or some few oscillations at a time, practically no current passing during the time the other arcs are in action. (Ten figures.)

28,854/13. **Conduit Fittings.** R. W. PERRY. The fittings are provided with bosses to receive screw pins, clamping and making contact with the tubes, and the edges of the hole are turned over inwards to engage loosely a threadless portion of the screw pin to prevent its detachment. (Three figures.)

28,835/13. **Incandescent Lamps.** C. O. BASTIAN. Lamps with tightly coiled helical tungsten wire filaments sealed by tungsten leading-in wires into fused silica bulbs. (Three figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: McGEOCH [Casing] 8,062/14.

DYNAMOS, MOTORS AND TRANSFORMERS: B.T.-H. Co. (G.E. Co., U.S.A.) [Transformer Regulators] 29,063/13; DE LA RIBOISIÈRE and LE GRAIN [Motors for sliding windows] 29,562/13; MASON [Generators] 29,655/13; B.T.-H. Co. and POLLOCK [Dynamos] 124/14.

Electrometallurgy and Electrochemistry: HARBECK and LÄN [Electrolytic production of iron] 1,437/15.

Heating and Cooking: GAUNTLETT [Electric heating device] 2,325/14.

Ignition: CELERI [Electric igniters] 11,624/14; MASON [Magnets] 21,583, 21,610, 27,743, and 21,996/14.

Switchgear, Fuses and Fittings: B.T.-H. Co. (G.E. Co., U.S.A.) [Globe holders] 125/14 and [Voltage regulators] 5,776/14.

Telephony and Telegraphy: MARKS (Mead Electric Signal Co.) [Signalling apparatus] 25,062/13; PEDERSEN and POULSEN

[Multiple arrangement of high-frequency generators] 26,834/13; BROWN and PARSONS [Signalling system] 28,956/13; SYKES and FORD [Production of oscillations] 29,902/13; MARR [Pole pieces of telephone receivers] 1,715/14; WESTERN ELECTRIC Co. (Woodward for W.E. Co., U.S.A.) [Printing telegraphs] 9,376/14.

Traction: HUTCHES [Automatic control of electric railways] 28,703/13.

Miscellaneous: JOBKE [Magnetic separators] 26,364/13; CLARKE [Advertisement device] 29,516/13; MCKAY and CLAUSSEN [Portable lamps] 2,495/14; WILSON [Electric chiming gear] 4,261/14; BURBRIDGE and ALDERMAN [Device for taking down and putting up lamps] 13,707/14; LYNCH WOCHNER and SAUERMANN [Magnetising permanent magnets] 19,517/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Meters: LANDIS & GYR [Prepayment] 24,013/14.

Telegraphy: ARMSTRONG [Receiver for continuous waves] 24,231/14.

Miscellaneous: CLENET and ANR [Ringing relays] 23,563/14; Soc. ANON. DES AUTOMOBILES ET CYCLES PEUGEOT [Safety apparatus for electric light installations] 23,813/14.

The following Amended Specification can now be obtained:—
Electric Furnaces: C. A. KELLER, 20,371/13.

Amendment Made

29,351/12. **Automatic Telephone Manufacturing Co., Ltd.** (Automatic Electric Co., Ltd., U.S.A.) This specification, which describes a method of automatic telephone working with main and sub-exchanges, has been amended by way of disclaimer.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: B.T.-H. Co. (G.E.C., U.S.A.) Insulating material, 19,035/05.

Dynamos, Motors and Transformers: A.E.G. [Compensating windings for turbo-generators] 20,808/06; SIEMENS BROTHERS DYNAMO WORKS and E. O. KIEFFER [Ventilated commutator] 19,891/08.

Instruments and Meters: G. HOOKHAM [Mercury watt-hour meters] 20,219/04.

Batteries: G. A. WEDEKIND [Copper oxide electrodes for alkaline primary batteries] 20,313/03; H. P. R. L. PÖASCKE [Dry cells with feric chloride depolariser retained by gum] 21,348/06.

Switchgear, Fuses and Fittings: B. T.-H. Co. [Controlling switch for watertight doors] 21,253/06; D. ASSERSONN [Holder for tubular lamp] 21,197/07.

Telephony and Telegraphy: W. JUDD, A. FRASER and R. HARDIE [Automatic transmitter] 19,099/05; E. BLOS [Automatic telephone exchange selector switch] 21,752/09.

Miscellaneous: L. S. ROLLAND [Electric welding machine] 19,116/05.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The *Wireless World* contains a description of a powerful wireless station recently opened by the Marconi Co. for the Chilean Government at Punta Arenas on the wild coast of Patagonia in the Straits of Magellan, which is said to be the most southerly town in the world. The station is housed in a ferro-concrete building some three miles from the town, and contains a 100-kw. equipment for long-distance communication and a 5-kw. set for ship traffic, &c. Four distinct aerials are used—two for radiating different lengths of 100-kw. waves, one for reception of long waves, and the fourth for the 5-kw. set. All are of the inverted L directive type, and are supported on pulley blocks slung from porcelain insulators on 250-ft. steel masts, so that an adjustable sag is allowed to prevent undue strain in heavy gales. Provision is made for passing current through the aerial wires to thaw them if covered with a dangerously heavy load of ice. The

large generating plant is driven by a 270-h.p. Diesel engine, and develops 140 kw. at 200 to 360 volts continuous-current; a 2,000-ampere-hour battery is also provided. The transmitting apparatus includes a condenser of 1.25 mf., made up of 416 "Poldhu" pattern pots of a new design charged at 10,000 volts, and a 38-in. radial disc discharger in a sound-proof chamber. Either 5,000 or 3,000 metre waves can be sent. Both crystal and valve type receivers are used for the long waves, and a magnetic detector and a spark recorder is used in connection with the 5-kw. set. Hand as well as automatic transmission by perforated strips is provided for. The large set is used principally for communication with Puerto Mouth on the Chilean coast, some 850 miles to the north.

A Ramsgate man named Richard Softley has been fined £15 for having in his possession a wireless telegraph apparatus which the Post Office officials stated at the police court prosecution could have been fitted up in three or four hours to receive messages from Germany or any high power station within a 1,000-mile radius. The defence was that the parts were used to teach Boy Scouts.

Telegrams for Mollendo and district are no longer subject to delay.—The cable between Paramaribo and Cayenne has been repaired.

ELECTRIC TRACTION NOTES

A serious short-circuit occurred on Jan. 6th in one of the underground electric railways in New York on one of the feeder cables, and the smoke produced caused a panic and rendered a considerable number of passengers unconscious in the over-crowded trains. The traffic was brought to a standstill for some time, and the work of rescue was attended with great difficulty. In all some 300 persons are reported injured, and there was one death. It is stated that the issue of tickets was not stopped immediately, and further passengers continued to crowd into the stations. From some accounts it would appear that a further fire was caused by attempts to re-establish the supply. Officials of the London Electric Railways state that such an occurrence could not be attended with such serious results on the London Tube Railways, owing to the better ventilation, the more complete arrangements for emergency lighting, and the

better organisation for conducting the passengers away. More complete information as to the nature of the fire will be awaited with interest. From telegrams so far to hand it is not clear whether any of the rolling-stock caught fire.

The dispute between the Stepney Borough Council and the London County Council as to the electrification of the horse tramways in that Borough, which was the cause of the experiments with the surface-contact system in the Mile End Road, is again engaging serious attention. The L.C.C. is proposing to equip the tramways in Grove Road and Burdett Road upon the overhead system, and the Hackney and Bethnal Green Councils, in whose districts the lines also run, have agreed. Stepney, however, has hitherto refused to agree to anything but the conduit system, and the Board of Trade has intimated to the Stepney Council that it will not be prepared to withhold its consent to the reconstruction on the overhead system, on the mere ground that the L.C.C. will not adopt the conduit system.

There is a probability of the Mumbles Railway being converted to electric traction at an early date. This steam line is the second oldest in the United Kingdom, and is worked by the Swansea Improvements and Tramways Co.

"ELECTRICAL ENGINEERING" TRADE SECTION

CATALOGUES, PAMPHLETS, &c., RECEIVED

LANTERN SLIDES.—Siemens Bros. Dynamo Works, Ltd. (Caxton House, Westminster), have issued a revised catalogue of the technical lantern slides which they keep in stock and are ready to lend to lecturers, schools, &c. The list has been considerably extended, and contains 208 different views of all classes of electrical machinery and apparatus manufactured at the Stafford and Dalston works.

WASTE HEAT BOILERS.—A pamphlet from the Bonecourt Waste Heat Boiler Co., Ltd. (Parliament Mansions, Victoria Street, S.W.), gives particulars of a series of furnaceless boiler for utilising the waste heat of the exhaust gases of internal combustion engines or industrial furnaces, without additional cost of fuel. Another form is a combined waste heat and fuel-fired boiler utilising the Bonecourt system of surface combustion.

ELECTRIC COOKING.—A new list of electric cooking apparatus issued by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.), deals with a very complete range of appliances, and includes many designs of kettles, irons, hot plates, toasters, &c. Electric ovens of four distinct types are illustrated, and electric urns, large and small water-heaters, hot cupboards and the larger class of electricity heated appliances are also listed.

ELECTRICAL SUPPLIES.—The Edison & Swan United Electric Light Co., Ltd., have brought out a new and effective "poster stamp," bearing the words, "Ediswan Everything Electrical.—The Symbol of Electric Service."

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

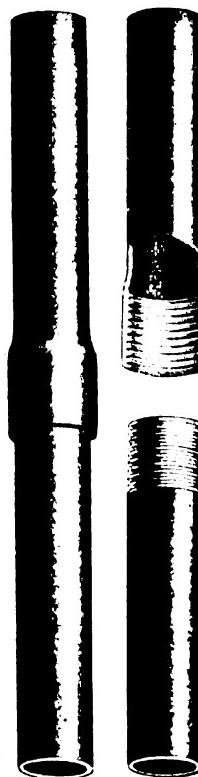

FITTINGS FOR HALF-WATT LAMPS.—The Sun Electrical Co., Ltd. (118 and 120 Charing Cross Road, W.C.), send us a new list of their own registered designs of British-made fittings for half-watt lamps, in which the various points that require attention when dealing with light sources of high intrinsic brilliancy, have been specially attended to.

HEATING AND COOKING APPARATUS.—Another new list from the Sun Co. deals with electric cooking apparatus, &c., of handsome design for use on the table. These are of high finish as well as reliable electrical quality.

IRONCLAD SWITCHGEAR.—J. H. Holmes & Co. (Newcastle-on-Tyne) have recently developed an interesting system of ironclad switchgear of the draw-out type, specially suitable to mining and sub-station work. This is now fully standardised, and prices and particulars of switch pillars on this system are contained in a leaflet which engineers will find interesting to consult.

INTERCOMMUNICATION TELEPHONES.—A folder from Electrical Installations, Ltd. (27-28 Martin's Lane, Cannon Street, E.C.), calls attention in an effective way to the advantages of the system of intercommunication telephones, which they are prepared to install and maintain.

A NEW WIRED CONDUIT.

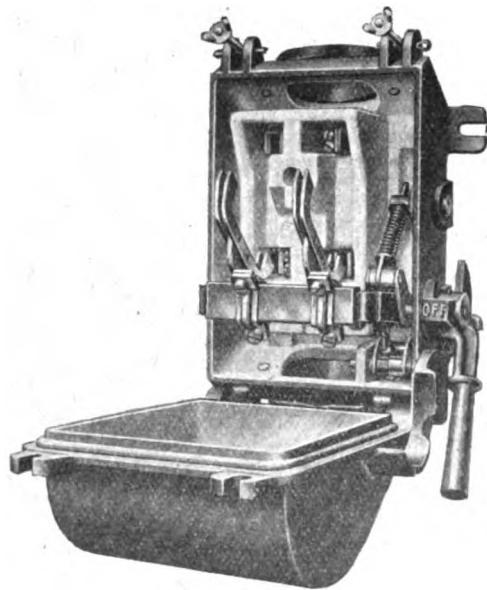

WE illustrate here a new wiring conduit recently introduced by the Perfecta Seamless Steel Tube & Conduit Co., Ltd. (Plume Street, Birmingham). It is seen that instead of couplings being employed to join up lengths of tube, the tube is bulged at one end and tapped with a tapered female thread, the other end being a standard parallel male thread. The appearance is, of course, much neater than with a conduit, and for surface work in hospitals and other public buildings the system has the additional great advantage of giving less surface for dust collection. For concealed work there is less depth of cutting away required, as there are practically no sockets or couplings to account for. It is claimed that, owing to the cutting action of the parallel thread when screwed home, the joint is absolutely watertight, and this cutting action naturally ensures perfect electrical continuity. An incidental advantage is that the length of the thread is less. For outside work, the bulged end of the tube is, of course, placed uppermost, so that water does not collect at the joint, as in the case of a coupling joint. The tube is supplied both in the seamless and welded qualities.

A NEW IRONCLAD SWITCH

A COMPACT design of ironclad water-tight switch with several interesting features has been introduced by J. H. Tucker & Co. (King's Road, Hay Mills, Birmingham) possessing several interesting features. The figure gives a good idea of its construction. Both the make and the break are rapid, independently of the rate of movement of the handle, and they are satisfactorily locked when in the on position. The actual break is a positive mechanical action, the spring acting only as an accelerator. The form of blade used gives a good springy contact, and the porcelain walls prevent all possibility of arcing to the case. Micanite insulation is used throughout, and the mechanism is so interlocked that the switch cannot be put on while the case is open, nor can the cover be opened while the switch is on. The cables lead directly into the wiring terminals, which are embedded

in porcelain. A variety of adapters are made to suit every class of conduit or wiring system. The cases are coated inside with a special silicate enamel, and the exteriors are

DOUBLE-POLE INTERLOCKED WATERTIGHT IRONCLAD SWITCH.

stove-enamelled at a high temperature. An earthing terminal is fitted, of the size recommended by the I.E.E. Only the 25-ampere is made at present.

INDIRECT LIGHTING

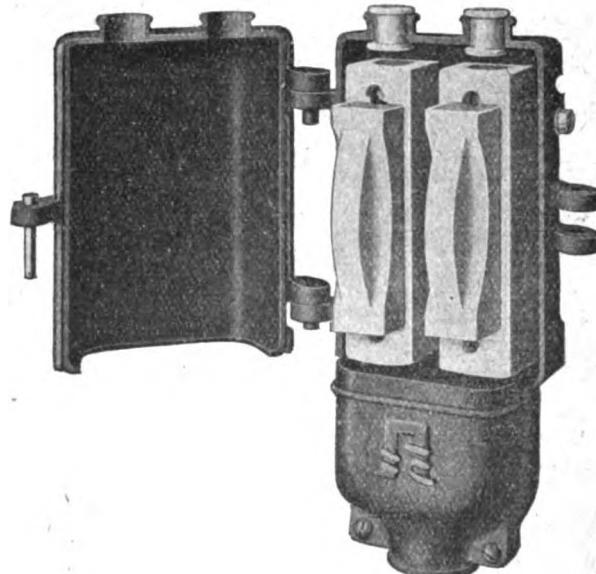

A NEW catalogue of fittings for indirect lighting has been produced by the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), who have long championed this restful form of illumination. It is interesting to compare their new list, comprising forty pages describing some fifty different types of fitting, with one dated May, 1912, of eight pages only, listing only two varieties. The prices, also, are reduced by about 33 per cent. since that time. The forms of fitting now listed include the original metal and composition suspended bowls, of which many new designs appear, including the recently-introduced luminous bowls with panels of coloured translucent glass, special dining-room fittings throwing a certain amount of light down on the table, as well as the powerful upward light, and a special hospital fitting with a glass dome over the bowl to exclude dust. Some very fine flambeaux-type wall brackets in metal and composition are also listed, as well as pedestal fittings and floor and table standards, all equipped with the upturned "X-ray" silvered glass reflectors, the efficiency of which has contributed so much to the success of the system. A special feature is the collection of fittings for use with half-watt lamps, a source eminently adapted to indirect lighting. We have from time to time illustrated most of the novelties as they came out,

SINGLE LIGHT INDIRECT FITTING, SHOWING METHOD OF ATTACHMENT OF REFLECTOR.

and we take the opportunity now of giving a representation of an entirely new inexpensive arrangement for applying reflector bowls to single lamps suspended in the ordinary way. A series of illustrations of actual installations give an idea of the fine effect produced and the extent to which the name "Eye-rest" identified with this system of lighting is justified.

AN IRONCLAD HOUSE SERVICE SET

IN order to provide a compact self-contained house service set cheaper both to buy and instal than the form with a separate sealing trough, the General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.), have introduced the ironclad set illustrated here, consisting of a pair of 10-ampere porcelain-clad Home Office type fuses mounted in a cast-iron case which forms part of the main casting of the split sealing trough. No parts

SELF-CONTAINED FUSE BOX AND SEALING TROUGH.

have to be removed for screwing to the board on which it is mounted, and the cable is taken straight from the sealing trough into the bottom terminals of the porcelain-clad fuses. With the cover open it is impossible accidentally to touch any live part. The whole apparatus weighs only 5 lb., and the overall dimensions are 9½ in. long by 5½ in. wide by 3½ in. deep; the set is available in both side and bottom entry patterns.

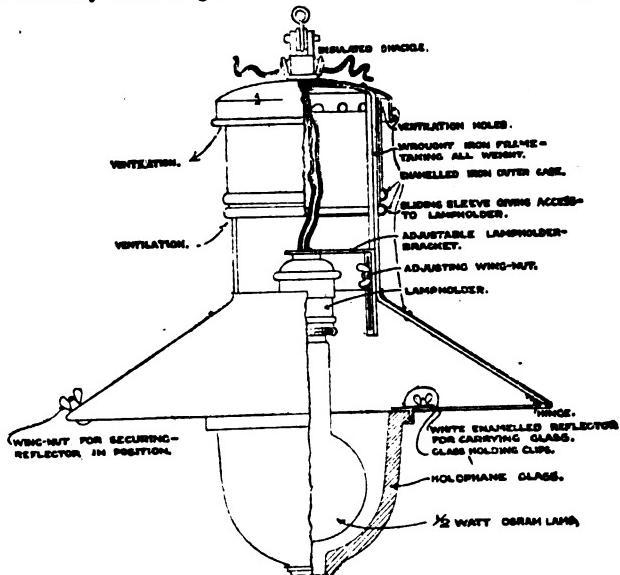

BRITISH MADE OPAL SHADES

THE old-fashioned conical opal shade, notwithstanding the existence of many less primitive patterns, has long retained its popularity owing partly to its cheapness. Unfortunately, however, the supply has hitherto been almost entirely from enemy countries. To meet this situation, the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), in conjunction with an old-established firm of English glass manufacturers, have introduced a new and improved opal shade of pleasing appearance, pure colour and excellent reflecting quality. The shape is such that the filament of a tungsten lamp is in its correct position for maximum efficiency. The design involves a "Ogee" curve, as shown in the figure. Two standard sizes are stocked, the smaller one 7 in. diameter by 4 in. deep, and the larger 9 in. diameter by 4 in. deep. Although the prices naturally show an increase upon those of the foreign article, the Company feels sure that the consumer will willingly pay the increased price for a British product of pleasing appearance and higher efficiency.

The Electrical Engineer's Diary.—The 1915 edition of this Diary, published by Messrs. S. Davis & Co., 30 and 31 St. Swithin's Lane, E.C., contains, in addition to the diary, the usual exhaustive information relating to electric supply and the application of electricity to various industries. The portion devoted to technical terms and definitions has been amplified and is provisionally approved by the British Electrotechnical Committee. The volume also contains the various Government departmental regulations and the Institution Wiring Rules, in addition to useful notes on subjects of interest to those engaged in central station work. A separate section is devoted to lighting, cooking, and heating.

A HALF-WATT STREET LANTERN

WE have received from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), some particulars of a new lantern for street-lighting purposes, which possesses some interesting features. It is known as the "County" lantern, and is provided with a Holophane globe, giving a remarkably wide angle of illumination. It is well designed

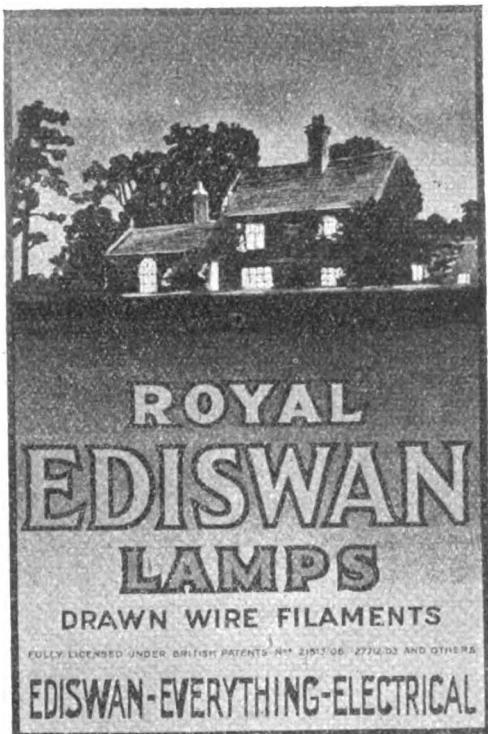

"COUNTY" LANTERN FOR HALF-WATT LAMPS.

as regards ventilation and simplicity of connections, and a sliding sleeve giving free access to the lampholder is provided to fit into an adjustable bracket to which the holder is attached, enabling perfect accuracy of focussing to be obtained. The lantern has a workmanlike appearance, and is finished in either vitreous enamelled or stove Japanned iron.

AN EFFECTIVE ADVERTISEMENT

WE illustrate here a new design which the Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex, and 123-125 Queen Victoria Street, E.C.), have

brought out as a transparency for fixing in their customers' windows, show-cases, &c. The effect from the white windows is excellent, and the artistic design of the transparency makes it most popular.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Australia.—The Brisbane Deputy Postmaster-General requires tenders by March 10th for a motor-generator, power board, telephone test board, &c. Further particulars at 72 Victoria Street, S.W.

Bedale (Yorks).—A local company has been formed with a capital of £3,000 to supply electricity in this district.

Clacton-on-Sea.—A new battery is to be installed at the electricity works.

Darlington.—The scheme of extensions briefly referred to in our last issue includes a 2,000 or 3,000-kw. generating set, three boilers, an economiser, and a travelling crane.

Hazel Grove.—Mr. T. L. Miller is to report upon an electric lighting scheme.

Holmfirth.—The Board of Trade has now sanctioned the scheme by which the Yorkshire Electric Power Co. will supply the Council in bulk.

Ipswich.—Coal elevating and conveying apparatus; coal bunkers; waggon-tipping gear. Borough Electrical Engineer. January 22nd.

Limerick.—An expenditure of £5,000 is to be incurred upon new generating plant.

Liverpool.—An electrically-driven drainage pump is required for the Canada Graving Dock, at an estimated cost of £550.

Manchester.—An expenditure of £20,000 on services and mains is contemplated.

Newcastle West (Ireland).—An electric lighting scheme by Mr. W. Phelan, J.P., a local resident, is under consideration by the Council.

Walsall.—A supply of electricity is to be given by the Corporation to the new pumping station in Rushall.

Waterford.—Mr. G. M. Lacey, the Council's consulting electrical engineer, has submitted two electric supply schemes involving the use of oil engines and steam engines respectively. These are now under consideration by the Electric Lighting Committee.

West Bromwich.—A loan of £2,997 is to be taken up for new plant.

York.—A L.G.B. inquiry was held last week in connection with loans as follows:—Mains, £11,400; services, £1,700; motors, £800; sub-station buildings, £500; plant, £4,400; transformers, £750. It was explained to the Inspector (Mr. H. R. Hooper) that the reserve fund at present stands at £55, and that although at the beginning of the past financial year there was a balance of £2,867, an outstanding liability of £2,812 had been paid off. The Inspector also criticised the policy of the Council in making a large reduction in price, which had, he said, practically had the effect of reducing the reserve fund to nothing. Although the output in 1913 was 500,000 units more than in the previous twelve months, the works costs, he added, had increased by a twelfth of a penny per unit, and the cost of coal was not likely to go down. Alderman Meyer, Chairman of the Electricity Committee, defended the action of the Corporation in reducing the price, notwithstanding that this had resulted in a drop in profits from £4,000 to £800 in one year. He contended that this was what an ordinary manufacturer would do to increase his business, and looked forward to such an increase in this instance.

Wiring

Bacup.—Fire station.

London: L.C.C.—260 wiring points at Exmouth St. Elementary School, Hampstead Road, N.W. (See an advertisement on another page.)

Oldham.—Council school, Higginshaw. Architects, Winder and Taylor, Union Street.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Barnet.—New municipal offices (£4,000).

Liverpool.—New parcel office, Hatton Garden. Assistant Architect, H.M. Office of Works, Bank Buildings, Derby Square.

Wigan.—Extensions to infirmary. Architects, Ralph & Son, Leader's Buildings, King Street.

Miscellaneous

Australia.—The Sydney Deputy Postmaster-General requires switchboard materials and 312 yds. of switchboard cable.—The Perth Deputy Postmaster-General requires telephone switchboard cords and switches. Feb. 10th. Further particulars in both cases at 78 Basinghall Street, E.C.

Doncaster.—Six trams are required at an estimated cost of £5,600.

Manchester.—Electrically-operated penstocks. Secretary, Rivers Committee, Town Hall.

Spain.—Four electric cranes. "Junta de Obras del Puerto de Valencia," Valencia. Feb. 10th. Further particulars at 73 Basinghall Street, E.C.

TENDERS RECEIVED AND ACCEPTED
AND ORDERS PLACED

London.—Messrs. Siemens Bros. Dynamo Works, Ltd., have received a contract for the supply of Wotan, Tantalum, and carbon-filament lamps for the Aberdeen White Star Line.

MISCELLANEOUS BUSINESS NOTES AND
TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £68 10s. to £64. (Last week, £60 15s. to £61 5s.)

German Electrical Industry.—The *Board of Trade Journal* states that German manufacturers have established agents in Amsterdam who carry stocks of dynamos and motors for sale to wholesale dealers on thirty days' terms. It is pointed out that as there appears to be a good opening in this class of goods for United Kingdom manufacturers, these latter should appoint agents, and quotations should be made c.i.f. Amsterdam.

Russian Agency.—A Warsaw firm desires to get into touch with United Kingdom manufacturers of dynamos, electric fans, lighting accessories, installation materials, telephones, bells, &c. Further particulars at 73 Basinghall Street, E.C.

Spagnoletti, Ltd.—Messrs. Spagnoletti, Ltd., have gone into voluntary liquidation for the purpose of reconstruction under the new title of The Park Royal Engineering Works, Ltd. The Company, which was established in 1851, is erecting model factories upon an extensive site at Park Royal, but, notwithstanding the change in title, the directors and staff, except for certain additions, are the same. The new factories, we understand, have been planned to deal with the firm's special requirements in their manufactures for the Admiralty, War Office, municipalities, railways, &c., and with the up-to-date plant being installed a very large output of modern switchgear, instruments, and special apparatus will be handled.

Mossay & Co.—This firm has removed from Horseferry Road to Queen Anne's Chambers, Westminster. Arrangements have been made with Messrs. Ransomes, Sims & Jefferies, Ltd., of Ipswich, for the manufacture and sale of their "Orwell" electric vehicles.

Bankruptcy.—The public examination of G. E. Hipkins, Electrical Engineer, 48 Wolverhampton Street, Dudley, took place last week. The liabilities amount to £510 and the deficiency £386. The cause of the failure is mainly attributed to loss on a cinematograph theatre.

APPOINTMENTS AND PERSONAL NOTES

Mr. R. H. Klein, Secretary of the Wireless Society of London, asks us to point out that, although his name has a somewhat German sound, he is a Belgian and a naturalised British subject, and a Licentiate in Consular Sciences at Antwerp.

Mr. J. D. Spark, Mains Superintendent at Swansea, has resigned to take up a similar position at Walsall.

The King's Lynn Corporation requires a Chief Assistant Electrical Engineer. (See advertisement on another page.)

An Engineer-in-Charge is required in the Sunderland Electricity Department. (See advertisement on another page.)

Particulars of vacancies for shift engineers, temporary switchboard attendants, and wiremen are given in our advertisement columns.

LOCAL NOTES

Doncaster: Municipal Wiring.—As in Edinburgh, the Doncaster wiring contractors are already taking steps to combat the scheme of the Corporation to obtain municipal wiring powers. The Mayor of Doncaster, who is also Chairman of the Doncaster Tradesmen's Association, has expressed himself in undoubted terms against the Corporation's proposal, and has intimated that he will vote against it.

London: Hammersmith: The Power Supply Schemes.—The Council is recommended by the Law and Parliamentary Committee to petition against both the London electric power Bills. With regard to the three questions asked by the L.C.C., set out on p. 10 of our last issue, the opinion is expressed that the Hammersmith Council will be prepared to take up the question of greater uniformity of supply than at present when the need is shown; that this can be done by the existing supply authorities under the Electric Lighting Act of 1909; and that neither the L.C.C. nor the Companies Bill offers any advantage to existing suppliers.

Newport (Mon.): Shortage of Labour.—The Borough Electrical Engineer has reported a difficulty in filling vacancies on his staff through enlistment, and states he has been obliged to offer increased wages, and to guarantee employment for a definite period, in order to obtain men.

Peterborough: Street Lighting.—In a report upon the future policy as to street lighting, the Borough Electrical Engineer recommends that all arc lamps should be discontinued and replaced by metal-filament lamps. He has been instructed to obtain specimen lanterns.

South Africa: Power Co.'s Progress.—The Victoria Falls and Transvaal Power Co. states that the business continues to make satisfactory progress, and that the war has not interfered with the undertaking. The profits show a steady increase since the beginning of last year, and the first extension of the set at the Brakpan power-house will be in commission in February. A second set it is anticipated will be ready two months later.

Watford: The "Norwich" System.—The Electrical Engineer has been instructed to report upon the working of the "Norwich" system of charging.

Wolverhampton: Supply in Bulk.—The Board of Trade has issued an order authorising the Midland Electric Corporation for Power Distribution to supply electrical energy in bulk to the Corporation.

The L.C.C. Power Scheme.—A correspondent who signs himself "Londoner" sends us a long communication in which he points out that the opposition to this scheme is getting so pronounced that it is questionable whether the L.C.C. will proceed with the Bill, even as far as the second reading. He contends that the huge weight of opposition from the Councils in outer London could have been dispensed with by leaving these out of the scheme without affecting it vitally. The only point in including them, he says, seems to be the purely theoretical idea of completeness. The special Electric Supply Committee of the L.C.C. has, our correspondent proceeds, ridden rough shod over the interests of both municipal and company undertakers, without practical consultation. He doubts whether anybody beyond the engineers who have prepared it, a small proportion of the Electric Supply Committee, and possibly a very meagre sprinkling of members of the L.C.C., are really in favour of the scheme.

SUMMARY

A COMPLETE study of the shape of the no-load-pressure wave in alternators and the methods of eliminating harmonics therefrom was contained in a Paper by Dr. S. P. Smith and Mr. R. S. H. Boulding, read at last Thursday's meeting of the Institution of Electrical Engineers (p. 22).

WE publish a list of the members of various classes of the Institution of Electrical Engineers who are on military service. The total number up to the present is 593, representing 8½ per cent. of the membership. No less than 228 out of the 986 students have joined, a percentage of 23 (p. 23).

THE design of reactances for current limitation in feeder circuits is discussed in our "Questions and Answers" columns (p. 24).

WE give some further particulars of the temporary 10,000-kw. generating station which the Birmingham Corporation are putting down owing to demands for power from manufacturers of war material (p. 25).

THE opposition to the two electric power Bills affecting London promises to be of a most formidable character (p. 25).

AMONG the subjects of specifications published at the Patent Office last Thursday were two methods of producing continuous waves for wireless telegraphy, and the regulation of converting plant. Two applications for the suspension of enemy-owned patents relating to electric ignition apparatus have been success-

ful. A patent for telephone party line working expires this week, after a full life of fourteen years (p. 26).

IN a Paper before the Institution of Post Office Engineers, Mr. S. C. Bartholomew describes methods of avoiding interference between power and communication circuits. Some interesting particulars as to the organisation and work in connection with the Army Telegraph Service are given in our notes on Telephony and Telegraphy (pp. 26 and 27).

A MERCURY vapour rectifier locomotive is undergoing trials in actual service in America (p. 27).

ARTICLES on an ironclad change-over switch, an improved Röntgen ray tube, marine telephones, and a method of leakage protection for motors appear in our "Trade Section" (pp. 28 and 29).

A 500-kw. turbo-generator is required at Hove; a 120-kw. set at Beckenham; two 1,000-kw. sets at Redditch, and services and transformers at Harrogate. The Truro lighting scheme is going forward; a loan of £30,000 has been granted at Greenock, and further extensions are contemplated at Barrow (p. 31).

SHEFFIELD electrical contractors are to take proceedings against the Corporation in regard to the Sales Department.—Edinburgh Corporation intends to continue with its application for municipal wiring powers (p. 32).

THE ILFORD CASE

THE Ilford Urban District Council has consented to declarations that the hiring of arc lamps, motors, &c., and the running of a showroom has been carried on by them illegally, and further that their tariff which offers better terms to consumers who have their premises lighted by electricity only is also illegal. Thus ends the action against the Council by the Ilford Gas Co. This result was announced in the Chancery Division before Mr. Justice Sargent yesterday. We will refer to the matter in greater detail next week.

Arrangements for the Week.—(To-day) Thursday, Jan. 21st.—Greenock Electrical Society, 21 West-Stewart Street, Greenock. "Electricity in a Shipbuilding Yard," by Duncan Angus, 7.45 p.m.

Saturday, Jan. 23rd.—Association of Mining Electrical Engineers, West of Scotland Branch, Royal Technical College, Glasgow. Joint meeting with National Association of Colliery Managers. "Electricity at the Coal Face," by John Bowman, 4.30 p.m.

Association of Mining Electrical Engineers, Notts and Derbyshire Branch, at University College, Nottingham. (1) "Some Power Station Details," by C. Lewes. (2) "Surface Earthing at Scottish Mines," by P. S. Glover, 3.30 p.m.

Tuesday, Jan. 26th.—Institution of Electrical Engineers, Manchester Section, Engineers' Club, Albert Square. "Electric Steel Making Furnaces," by T. D. Robertson, 7.30 p.m.

Wireless Society of London, at I.E.E., Victoria Embankment. Presidential Address by A. A. Campbell-Swinton, 8 p.m.

Thursday, Jan. 28th.—Institution of Electrical Engineers. Sixth Kelvin Lecture. "Lord Kelvin's Work on Gyrostatics," by Prof. A. Gray, F.R.S., 8 p.m.

THE SHAPE OF THE PRESSURE WAVE IN ELECTRICAL MACHINERY

A PAPER with this title, by Dr. S. P. Smith and Mr. A. R. S. H. Boulding, was discussed at last Thursday's meeting of the Institution of Electrical Engineers. The first section of the Paper discussed the classification of windings, dividing them into single-layer and double-layer windings, the former generally used for high pressures where there are several conductors per slot and essentially open windings, and the latter connected lap or wave, forming either ordinary open windings with the coils in two layers or open or closed commutator windings. Closed windings were seldom used for alternating current except with commutators. With regard to uniformly distributed windings it was seen that where the number of slots per pole is an integer, and a normal arrangement of slots and poles is adopted, the effect of the teeth will be greatest. When the poles or slots are skewed in such a manner as to make the conductors occupy all possible positions in the field, the winding is equivalent to a uniformly distributed winding, and the effect of the teeth is nil. When the pole-shoes are displaced, or the number of slots per pole is fractional, the equivalent distribution of the winding is increased. With respect to the effect of the teeth on the shape of the pressure wave, these intermediate cases give practically the same result as a uniformly distributed winding. In all cases, therefore, where there is an abnormal arrangement of the field or armature system, or a fractional number of slots per pole, it is allowable in practice to regard the winding as uniformly distributed.

The authors investigated mathematically the general expression for the E.M.F. induced in a coil, taking into account the effect upon the presence of harmonics of the coil span for various flux distributions with salient and non-salient poles, incidentally bringing out the point that there can never be a third harmonic in the line pressure of a star-connected three-phase generator, nor in the alternating pressure of a three-phase rotary-converter, nor in the phase pressure when each phase extends over $2/3$ of the pole pitch, nor in the pressure of a single-phase alternator with two-thirds of the periphery wound. This also holds when the winding is placed in slots instead of being uniformly distributed.

The effect of the slots on the "distribution factor" and the "group factor" were investigated, and the analytical argument was admirably illustrated by oscillographs.

Summing up, the authors write that the spacing of the armature slots has a selective influence—with a normal arrangement of slots and poles all the harmonics in the B-curve are reproduced in the pressure induced in each conductor or full-pitch coil, but in the phase and terminal pressures most of these are practically suppressed by their low winding factors, whilst others of the orders $2Q \pm 1$ (where Q =the number of slot-pitches per pole-pitch) appear very pronounced because their distribution factors approach unity. Before a harmonic can appear at all in the pressure, it must exist in the B-curve—always assuming the latter to be steady. The winding factor only selects some of these and suppresses the others, and so produces the spacing ripple. A wave with a pronounced ripple may have fewer harmonics than a smooth wave: for instance, if a particular harmonic, say the fifth, were suppressed from the rectangle, the resultant curve would not be nearly so smooth. The spacing ripple in salient-pole machines is chiefly important with two or three slots per pole and per phase, and unless one of the several methods for making the winding-factor very small is used, it is generally advisable when a smooth pressure wave is needed, to round off the pole tips so as to reduce the harmonics in the B-curve. With non-salient-pole machines the number of stator slots per pole is generally larger, and the chief care must be taken to avoid clashing with the number of teeth on the rotor. An inspection of the expression for the distribution factor will show that for the n th harmonic, it can be made zero in the same way as with uniformly distributed windings, so that the terminal pressure of a winding filling two-thirds of the slots will have no harmonics, the orders of which are multiples of three. Hence, with a steady flux, to obtain a pressure at the terminals free from harmonics there must either be no harmonics in the B-curve, or their winding factors must be so low as to make them negligible. In the case of the tooth effect, the winding factors in question can be made very small by making Q a fraction, or by skewing the slots, or by skewing or displacing the pole-shoes.

The effect of flux pulsations due to the teeth was then investigated; the true tooth ripple was shown to have very little effect, as there is always a tendency for oscillations in the

magnitude of the flux to be damped out by eddy currents and currents induced in the exciting winding. The ripple caused by swinging of the total flux is of greater importance, and this is investigated mathematically and by aid of oscillograms at length in the Paper. The effect of swinging is to produce a ripple of frequency $2Q$ times that of the fundamental, whilst its amplitude is proportional to the electro-motive force. The amount of flux swinging depends largely on the constructional details of the machine, such as the number of slots per pole, the ratio of slot-opening to gap, the skewing of the slots or pole-shoes, &c., and by suitable design it can be made fairly small. The commonest method for reducing the swing is to use nearly closed slots. There are external methods of suppressing the tooth ripple from the terminal pressure. For example, a method that has found favour of late years has been the use of a resonance circuit across the terminals of the machine, adjusted to resound with the frequency of the tooth ripple; though in most cases the addition of one or two extra slots would certainly be a much cheaper and an effective way of preventing disturbances in telephones.

The latter part of the Paper, for which Dr. Smith is responsible, deals with a method of vector analysis applicable to these and other problems connected with armature windings.

The discussion was opened by Prof. Silvanus P. Thompson, who appreciated the way in which the authors had arranged their facts in logical sequence without paying attention to priority of discovery. Valuable work has been done on the subject by American investigators, whose oscillograms were of all the more interest in the light of the present Paper. The authors were particularly happy in the way in which they had disentangled the effects of ripples from different causes. There were one or two matters of nomenclature that he protested against, such as the use of the word horn for the centre of the pole instead of the pole tip. He thought that the most satisfactory way of avoiding the presence of harmonics was to shape the pole pieces so that they were completely absent from the flux wave rather than getting rid of them afterwards. One of the most real advantages of salient poles was the way in which they lessened the effect of armature reaction. He noted how often the expressions as $\sin \theta/\theta$ and $\sin n\theta/n \sin \theta$ occurred in the mathematics in the Paper, and proposed that these should be known by the special names "cursin θ " and "pursin (n) θ ," and should be tabulated for ready use in such calculations. He regretted that the Paper stopped short at no-load conditions.

Mr. H. Burge (Crompton & Co.) said that salient poles were much more difficult to construct satisfactorily in turbo-alternators. He did not quite approve of the authors' classification of windings, and thought that a further investigation of the conditions on load would throw interesting light on the working of alternators with high reactance, such as were often used to limit the short-circuit current.

Mr. C. C. Hawkins referred to the method of suppressing harmonics by a wind coil connection developed by Prof. Adams in America. High harmonics, even when reduced to a percentage that appeared satisfactory on an oscillogram, might, he said, still give trouble when conditions of resonance were present. Now that they had such complete means of ensuring the absence of the principal harmonics, including the triple frequency harmonic, it was possible that a return might be made to most connected windings, which were very convenient under certain conditions. He thought that the authors' remarks on flux swinging were a little vague, and was not satisfied as to the correctness of one of the diagrams.

Mr. A. R. Everest (B.T.-H. Co.) was a little disappointed not to find more practical comparison of the different methods of suppressing harmonics, and to the very different conditions obtaining on load. He did not agree with Dr. Smith as to the advantage of non-salient poles, and thought that as near an approximation to a sine curve could be obtained with a salient pole. The authors' proposed remedy of skewing or staggering the slots would lead to difficulties in manufacture. The amortisseur slots also had some influence on the form of the pressure wave. Unequal spacing of the slots was, of course, impracticable, but the use of a practical number of slots per pole was a remedy often used. Some sort of standard specification of wave form was required. In America it had been suggested that no harmonic should exceed the fundamental wave in amplitude by more than 10 per cent. Another method of testing the wave form was by taking measurements of the capacity of a condenser with the wave to be tested and comparing the result with that for a pure sine wave.

Dr. G. W. O. Howe spoke at some length on the swinging of flux in the teeth, and vigorously defended the author's diagram attacked by Mr. Hawkins.

Mr. Jacob pointed to the remarkable agreement between the calculated wave forms and actual oscillograms in the Paper. The use of a few empty slots gave satisfactory results in single-phase machines, but was not very practicable in polyphase generators. In such machines as rotary converters the effect of the tappings often gave more trouble than the ripples from causes that had been discussed.

ELECTRICAL MEN ON ACTIVE SERVICE

THE Institution of Electrical Engineers has prepared a list of their members on military service, several of whom have left important positions to join the colours. The total is 593 out of a membership of 7,040—i.e., about 8½ per cent. This, of course, represents only a portion of the total contribution of the electrical industry to the naval and military forces. Three of the largest electrical manufacturing works have sent out about 1,000 men each, and, at a rough estimate, about 10,000 workmen have gone from works of this class. To this must be added the employees of electric light and tramway undertakings and the electrical men on the railways, and the total is probably well up to 20,000 all told. It must not be forgotten that the electrical industry is one which must be worked to its fullest capacity during wartime. All the larger works are as busy as they can be on work arising directly out of the war, and, in addition, the electricity works, railways, and tramways must be kept going; so it speaks well for the patriotism of all the workers in the industry that this large number of men have gone for active service.

The most noticeable feature in the Institution list is the large proportion of students who have volunteered for military service. Out of 986 students, 228 are now in the Army or Navy—actually 23 per cent.

The following is a list of the Members on active service. In the case of members who were in the regular Army or Navy before the war, their rank is given before their name, in the other cases after.

Col. A. H. Bagnold, R.E.; E. A. Barker (Borough E.E., Barnsley) Lieut. and Qmr. 5th York & Lancs. Regt.; D. Bates (Works Manager, British Insulated Co.) Lieut.-Col. 5th Sth. Lancs. Regt.; V. B. D. Cooper, Major, R.E.; J. M. Donaldson (North Met. Elec. Power Co.) Capt. 16th King's Royal Rifle Corps; Major A. H. Dumaresq, R.E.; K. Edgcumbe (Everett, Edgcumbe & Co.) Major, London Elec. Eng. R.E.; R. W. Hammond, Capt. 19th Royal Fusiliers; General and Col. Commandant Sir R. Harrison, G.C.B., C.M.G., Royal Engineers; S. B. Haslam (Haslam & Stretton, and Hon. Sec. Cardiff Section I.E.E.) Lieut. 5th Welsh Regt.; Prof. J. B. Henderson (Borough Polytechnic) Admiralty Staff Duty; Col. H. C. L. Holden, C.B., F.R.S., Director Mechanical Transport; Prof. B. Hopkinson, F.R.S., Major Cambridge Univ. O.T.C.; H. L. Howard, Lieut. R.E., T.F. Reserve; A. H. Law (Managing Director, C. A. Parsons & Co.) Capt. 1st Northumbrian Brigade R.F.A.; F. A. Cortez Leigh (Elec. Eng. L. & N. W. Rly.) Lieut.-Col. Western Signal Service, R.E.; A. E. Le Rossignol, Lieut.-Col. London Elec. Eng. R.E.; J. F. Lister (Veritys, Ltd.) Lieut.-Col. Southern Signal Service R.E.; W. McLellan (Merz & McLellan) 2nd Lieut. 17th Northumberland Fusiliers; Major W. A. J. O'Meara, C.M.G., R.E.; Major-General R. M. Ruck, C.B., R.E.; Capt. H. R. Sankey, R.E.; H. C. Sparks, 2nd Lieut. London Scottish; C. S. Stafford (Asst. Managing Director, Dick Kerr & Co.) Lieut. A.S.C.; R. Stanley (Belfast Mun. Tech. Inst.) Capt. R.E.; Brig.-General A. M. Stuart, Director of Works; C. D. Taite, Capt. 8th Lanc. Fusiliers (Reserve); Viscount Templetown, Lieut. (Staff Censor's Office); T. Tomlinson (Hon. Sec. I.E.E. Dublin) Asst. Div. Off., South Dublin Dist. R.E.; T. M. W. Wallis (J. H. Holmes & Co.) Sub-Lieut. R.N.V.R.; R. J. Wallis-Jones, Capt. 4th Welsh Brigade, R.F.A.; Major R. ff. Willis, R.M.L.I. J. C. Chambers (Lieut.-Col.), R. De Valbreuze (Lieut., Wireless Corps, French Army), F. T. Hall, A. Handley (Capt.), H. D. W. Lewis (Officer Commanding, 1st Field Ambulance, Welsh Army Corps), A. E. Loos (Lance-Corpl.), W. H. U. Marshall (2nd Lieut.), W. L. Maxwell (Corpl.), P. D. Michod (Capt.), G. T. W. Olver (Capt.), A. P. Pyne (Lieut.), F. O. J. Rouse (Lieut.), G. Seligmann-Lui (Lieut.-Col., French Army), C. Wade (motor-driver, French Red Cross), J. Wayne-Morgan (Lieut.), H. O. Wraith (Lieut.), and H. W. Young (Lieut.).

In addition, the following members have joined the Anti-Aircraft Corps (R.N.V.R.) :—

C. W. S. Crawley (Chief Petty Officer), H. T. Harrison, F. B. O. Hawes, F. Pooley, N. W. Prangnell, and H. W. Ridley.

The Associate Members are :—

G. C. Allingham (Tudor Co.), Lance-Corpl., Divisional Engineers, R.N.D.; B. Binyon, Lieut. Royal Naval Air Service; W. E. Brandreth, (Eng. & Manager, Wycombe Elec. Light & Power Co.) Capt. 7th Essex Regt.; Capt. D. S. Collins, R.E.; J. G. Cunliffe (Birmingham Trams) 2nd Lieut. 18th Manchr. Regt.; R. G. Cunliffe (Manchester Trams) 2nd Lieut. R.G.A.; Capt. A. E. Davidson, R.E.; W. P. Dibby, Lieut. London Elec. Eng. R.E.; H. Emmott (Halifax) Sergt. R.A.M.C.; Capt. E. O. Henrici, R.E.; L. B. Hogarth (Boro' E.E. Whitehaven) Lieut. 11th Border Regt.; E. S. Hurlbatt (Dick, Kerr & Co.) 2nd Lieut. 7th Manchester Regt. (1st Res.); G. W. C. Kaye (N.P.L.) Capt. London Elec. Eng. R.E.; Capt. H. P. T. Lefroy, R.E.; F. H. Masters (Asst. Editor, *Electrician*) Capt. London Elec. Eng. R.E.; A. E. Mayes (Chief Engineer, I.O.W. Electric Co.) Major, 8th Hampshire Regt.; W. H. Merrett (Royal School of Mines) Capt. London Elec. Eng. R.E.; G. C. Milnes (Boro'

Elec. Eng. Lancaster) Lieut. 5th Royal Lancaster Regt.; N. Mitchell, Lieut. Royal Naval Air Service; B. J. Moore, Pilot, Royal Flying Corps; H. E. Morrow (L.C.C. Paddington Tech. Inst.) Lieut. Div. Eng., R.N.D.; K. A. Mountain, Lieut. Tyne Elec. Eng'rs, R.E.; L. G. E. Morse, Lieut. London Elec. Eng'rs, R.E.; R. L. Pearson (Reading University) Capt. Berks. Yeomanry; Lieut.-Comr. R. F. Pitcairn, R.N.; T. Rich, Capt. London Elec. Eng'rs, R.E.; A. N. Rye (Chief Engineer, Guernsey Elec. Light & Power Co.) 2nd Lieut. Royal Guernsey Engineers; F. B. Shaw (Manchester School of Technology) Lieut. Royal Naval Air Service; G. H. Spittle (G.W. Rly. Elec. Dept.) Major Div. Eng'rs, R.N.D.; O. Thornycroft, Lieut. R.N.V.R.; N. B. Tomlinson, Flight-Lieut. Royal Naval Air Service; Lieut. H. de C. Toogood, R.E.; S. Utting (London Repr. L. Prat, Paris) Lt. A.S.C.; Capt. O. T. Webber, R.E.

J. N. Alty, R. Amberton (Lieut.), H. G. Andrews (Sub-Lieut.), A. S. Angwin (Major), A. Ardern, C. L. Arnold (2nd Lieut.), A. H. Atkins (Lieut.), F. R. Bader (Major), T. C. Baillie (Lieut.), H. R. Baldwin (Sub-Lieut.), H. K. Benson (2nd Lieut.), M. G. Bland (2nd Lieut.), R. B. Bowker (Major), G. F. Boxall, W. B. Boyd, G. Bradwell (Lieut.), H. A. Brimelow, R. A. Broad (Lieut.), G. J. L. Brown (Lance-Corpl.), H. Brown (Capt.), T. A. Brown, W. Brown, W. F. Brown (Lance-Corpl.), J. Bruce-Kingsmill (Lieut.-Col.), W. W. Buckton, A. W. Bullough, W. Bunn (Capt. and Hon. Major), C. M. Campbell (Capt.), H. Carey-Thomas (Capt.), W. M. Carver (Lieut.), T. Challoner (2nd Lieut.), F. J. Chapple (Capt.), H. Church (Corpl.), R. W. Clark, F. C. Clarke (Lieut.), J. F. Clunas, J. C. Connan (Lieut.), H. A. Cope (Lieut.), H. Corney (Sergt.), H. G. B. Cresswell (Lieut.), C. E. Crossley, C. H. Davidson (Actg. Bombardier), L. H. Davies, V. O. I. Davis (2nd Lieut.), H. J. G. Davison, A. J. Dickinson (Major), T. F. Dillon, W. Dobson (Eng. Commr.), J. W. Dodds (Lieut.), J. Dubbin (Sergt.), F. P. Dumjoh (Sergt.), E. J. Dutch, H. A. Edger, E. P. Elwin, G. G. Ewer (Capt.), S. K. Ferrier, F. W. Foster (Lieut.), R. A. Frank (Sergt.), H. W. Franks (2nd Lieut.), A. R. Fraser (Sergt.), G. G. Fraser, R. H. Friend, P. B. Frost, W. P. Fuller, A. E. H. Gates (Corpl.), F. W. Geoghegan (Lieut.), J. S. Gibson, J. Gilbert, C. H. Goulden (2nd Lieut.), C. B. Grace (Capt.), T. R. Graty, R. Grierson (Lieut.), E. E. Grover (Lieut.), W. L. D. Gundry (Lieut.), C. S. Hann, C. C. A. Hardie (Lieut.), L. Harris, H. M. Harrison, H. M. Hart, G. F. Herron (Lieut. R.N.A.S.), C. Higgins (Lieut.), F. A. Hill (Sergt.-Major), R. Hills (Capt.), L. W. Hipwell (2nd Lieut.), W. Hodson, H. N. Holland (2nd Lieut.), A. J. Hollington, H. C. Holroyd (2nd Lieut.), S. J. Hough (2nd Lieut.), E. Hoyle (Corpl.), S. W. Humphrey (Major), W. H. Hunstone, E. B. Hunter (Lieut.), J. C. Hutton (Corpl.), F. A. Iles (Major), E. W. Jackson (Sergt.), L. E. S. Jackson, A. L. Johnson (Sergt.), E. W. Kay, G. W. Kidd (Eng. Lieut.), H. F. A. Kinder (2nd Lieut.), H. M. Kirkby (Sergt.-Major), W. D. Kirkpatrick, L. Lamb (Lieut.), J. W. Law (Lieut.), F. A. Lawson, E. Lefeaux (Capt.), C. G. Le Feuvre, A. E. Levin (Capt.), N. V. Lloyd, J. C. Lyell, A. J. P. McCarthy, A. McNaughton (Major), G. G. Mallinson (Capt.), J. A. Manners-Smith, H. H. S. Marsh (Major), D. Martin (Col. Sergt.), I. W. Massie (2nd Lieut.), S. Mathews (2nd Lieut.), K. G. Maxwell (Capt.), W. Mead, E. Middleton, N. Miller (W.O.), R. C. Milliken (2nd Lieut.), J. L. Moffet (2nd Lieut.), S. E. Monkhouse (Lieut.), W. C. Moore, J. H. Mousley (Major), A. M. Mulliner (Corpl.), James H. Murray, C. B. Nadaud (Sub-Lieut.), F. D. Napier, G. D. Nelson (Chief Petty-Officer, Royal Naval Air Service), V. W. Newman (2nd Lieut.), R. S. Newton (2nd Lieut.), E. Orloff, L. Oulton (2nd Lieut.), H. W. S. Outram (Capt.), L. Owen (Corpl.), W. Pate (2nd Lieut.), H. H. Pearson (Corpl.), B. H. Peter (Sergt.), C. H. Phillips (Corpl.), J. H. S. Phillips (Major), T. F. Phillips, P. C. Pocock (Lance-Corpl.), A. F. C. Pollard (2nd Lieut.), L. H. Pratt, W. F. Price (Capt.), F. D. Pyne (Lieut.), H. K. Reed, T. N. Riley (Lance-Corpl.), A. Roberts, A. H. Robinson (Major), W. R. Rogers (Chief Torpedo Instructor, R.N.), B. Roseveare (2nd Lieut.), G. L. Russell (Lieut.), W. E. Russell, H. R. Sanders, P. P. Sandford (2nd Lieut.), A. H. Schultz (Capt.), J. Scott, R. Scrivener (Lance-Corpl.), E. G. Sheppard (Capt.), N. S. Sim, A. Smith (Elec. Artificer, R.N.), A. B. Smith (Corpl.), A. P. Smith (Capt.), T. A. Smith, K. R. N. Speir (Capt.), B. G. Stewart, H. Stone (Capt.), L. F. Summers (Eng., Mercantile Fleet Auxiliary Branch, R.N.), W. A. Talbot (Corpl.), C. A. Taylor (Sergt.), G. S. Taylor (Lieut.), E. J. Taylor, H. B. Taylor (Lieut.-Comr.), R. D. Thomas-Jones (Lieut.), F. W. Timmis (2nd Lieut.), E. B. Trimmer, H. A. Tulloch, H. E. Turner (Corpl.), H. W. Tyler (Capt.), J. D. A. Vincent (Lieut.), F. M. Walker (Staff Sergt.), W. Watson (Sergt.), H. W. Watts (Capt.), H. E. Webb-Bowen (Capt.), W. Weekes (Sergt.), B. G. White (Sergt.), J. D. White (Lieut.), W. Whitney, O. N. Wightman (Capt.), E. Williams, G. Williamson, W. S. Wilson (Lieut.), A. L. Wood (2nd Lieut.), E. L. Wood, E. H. E. Woodward (Capt.), T. H. R. Wray (Commander), F. T. Wright (Lieut.), C. R. M. Young (Lieut.).

The Associates are :—

Major E. Davidson, Army Ordnance Dept.; Major A. Gardiner, R.E.; R. W. Hughman (Man. Dir. *Electrical Times*) Lieut. 9th Middlesex Regt.; Capt. R. A. McClymont, R.A.; Col. A. C. MacDonnell, R.E.; Sir H. Norman, M.P., Commissioner, British Red Cross; A. M. Ogilvie, C.B., Col., Royal

Engineers (T.F.); Col. H. E. Tyler, R.E.; and C. W. Von Roemer (Chairman, Record Electrical Co.) Lieut. R.F.A.

W. J. Bishop (Qmr. Sergt.), A. E. Briscoe, R. C. G. Clark (Capt.), F. Coutts (Capt.), H. E. Davis (Major), H. A. Denison (2nd Lieut.), F. I. L. Ditmas (Staff Capt.), A. M. Doig, H. L. Downes (Lieut.), H. E. Goody, H. Greenwood, O. P. L. Hoskyns (Capt.), W. L. Johnson (Lieut.-Col.), P. W. McDougall, R. G. Madge (2nd Lieut.), P. H. Marco (Lieut.), C. W. Miller (Lance Corp.), J. C. Y. D. Morgan (Lieut. R.N.), P. W. Northey (Lieut.), S. Pilkington (Lieut.), H. W. Prance (Major), J. W. Punter (Capt.), D. L. Selby Bigge (Major), J. W. Slorach (Lieut.), C. G. Wells (2nd Lieut.), and O. Wheeler.

The Graduates on active service are:—

W. F. Andrews (Sergt.), G. A. Applebee (Qmr. Sergt.), F. S. Beamish, T. D. B. Bowater (Lieut.), E. G. Bowers, C. C. H. Brazier, H. A. Brown (2nd Lieut.), W. S. Browne, F. E. Burnett, Sir J. A. C. Campbell, Bart. (2nd Lieut.), A. F. N. Chandler, A. Douglas, G. H. Eardley-Wilmot (2nd Lieut.), H. Girdlestone, P. Grice, C. A. Grut, F. G. Heymerdingner, T. J. Hornblower (2nd Corp.), R. E. Hume-Williams (2nd Lieut.), F. P. S. Lacey (2nd Lieut.), A. L. Lintott (Capt.), H. J. Loughlin (2nd Lieut.), A. McPherson (2nd Lieut.), G. H. Murphy (Corp.), C. A. Newell (Sergt.), G. Ollier, F. L. Otter (2nd Lieut.), E. A. Pells (Lieut.), F. C. Platt, E. B. Preston (Corp.), W. A. Scotter, J. H. D. Sheppard (Lieut.), T. S. Stout, D. G. Thomson (Capt.), J. W. Treherne, C. Vandermin (Lance-Corp.), and A. N. G. Wood.

The Students on active service are:—

H. G. Byng (Artists Rifles), B. Z. de Ferranti (2nd Lieut., R.G.A.), V. Z. de Ferranti (2nd Lieut., R.E.), and A. C. Sparks (2nd Lieut., R.E.), J. R. Abbott (2nd Lieut.), H. O. Addicott, E. C. Albrecht, C. J. R. Alsford (Sub-Lieut., Royal Naval Res.), G. B. Alvey (Lance-Corp.), S. D. Anderson, T. C. Angus, H. Armstrong (Corp.), J. Aylmer (Lieut.), A. J. Bailey, F. L. Ballard, A. Bannister, E. G. Bannister (Lieut.), L. E. Barnard (2nd Lieut.), W. C. Barnes (2nd Lieut.), E. J. Barnett (2nd Lieut.), A. E. Barter (R.N.V.R.), E. A. Beavis (Corp.), A. L. Bedford, J. T. Bedford (Lance-Corp.), H. G. Bell (2nd Lieut.), B. S. Benning (2nd Lieut.), C. R. Bicknell (2nd Lieut.), E. J. Billington, C. A. Bold, C. R. Bolton, C. W. Bostock, C. W. Boxall, H. P. Bramwell (2nd Lieut.), L. A. T. Broadwood, H. Brooke (2nd Corp.), C. L. Bullock, J. H. P. Burchett, W. B. Burford (2nd Lieut.), R. Burleigh (2nd Lieut.), C. J. Burrage, A. N. Cam, S. A. B. Campbell, G. D. Canton, A. S. Carr (Lance-Corp.), R. L. Castle, G. H. Champ, E. V. Cheney, J. C. Clarke, H. Clausen (R.N.V.R.), D. H. Clifford-Smith (2nd Lieut.), J. P. Clifton (2nd Lieut.), A. G. Colston, W. W. Cooper (Lance-Sergt.), H. W. Corke (2nd Lieut.), E. W. Cosserat (Sergt.), P. J. Cottle (2nd Lieut.), H. S. Craig, A. E. Crampton (Lance-Corp.), C. B. Cripps, E. H. Croft (2nd Lieut.), H. S. Cuerden, P. N. Cunningham, H. H. Curtis, E. L. Damant, H. N. Davis (Lance-Corp.), G. G. Dawson, E. A. Deacon, W. J. F. Debley (Lance-Corp.), M. R. de Cordova (Lieut.), J. G. Deedes (2nd Lieut.), N. Devonald, P. Dobie, J. A. Donald, W. A. Douglas (Capt.), D. Dunham, F. G. Dunn, F. W. Eagle (2nd Lieut.), C. E. Easter, E. J. Edgar, N. D. Edinborough (2nd Lieut.), E. Edminster, S. Ethelston (2nd Lieut.), L. E. Felix-Smith (2nd Lieut.), A. C. Fendick (2nd Lieut.), C. M. Fiander, A. H. Finnis, J. Fleming, L. G. Floyd (2nd Corp.), J. Forbes (Lance-Corp.), H. H. Foster, R. Fruhe-Sutcliffe (2nd Lieut.), J. M. Furnival (2nd Corp.), W. E. Gardner (2nd Lieut.), F. J. Gibson (Corp.), J. A. Gibson (2nd Lieut.), F. Goble, D. C. Goodwin (2nd Lieut.), E. Gordon, J. O. Griffiths, S. J. Grose (2nd Lieut.), S. Gudgeon (2nd Lieut.), H. J. Gwyther (Lieut.), H. C. Hannam-Clark (2nd Lieut.), L. G. Harris, R. W. Harrison, L. V. Hart (2nd Lieut.), G. Hartley, C. E. Hawkins, H. Headwards (Sergt.), A. D. Hedgecock, A. T. Hitch (Lieut.), J. E. Hogarth, H. S. Housden, A. Howarth (2nd Lieut.), C. G. Huntley, A. Hutt, Forbes Jackson (Sergt.), H. Y. V. Jackson, E. F. James (Corp.), E. G. James, V. A. Jones, W. A. Kennedy, W. W. Kerr, J. W. Kilby, C. S. Knight, J. M. Knight (2nd Lieut.), H. A. Krasemann, V. R. Krohn (2nd Lieut.), C. F. Lane, B. W. Leak, H. J. Lee, B. E. Leeson (Corp.), B. H. Leeson (Corp.), G. A. B. Leishman (2nd Lieut.), G. N. Le May, A. Lisle, W. H. Lovell, A. W. R. MacPherson (2nd Corp.), F. H. Mann, G. S. Marston (Corp.), G. E. Martin (2nd Lieut.), R. O. Martin (Sergt.), J. N. Metcalf, B. E. G. Mittell (Sergt.-Major), P. Morrell, C. I. Morris, J. Mould (2nd Lieut.), J. W. Mowat, S. E. Newman, G. R. Nichols (Lance-Corp.), W. QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

QUESTION No. 1,426.

In a turbine-driven 25-kw. direct-current dynamo running at 5,000 r.p.m., it is observed, when running up, that there are several periods before the armature reaches top speed when undue vibration occurs. This vibration does not continue, but comes at intervals, whilst the machine is increasing in speed. What is the cause and remedy? In machines of this class, what is the best method of trueing commutators which are uneven due to wear?—R. W. S.

(Replies must be received not later than first post Jan. 28th.)

ANSWER TO No. 1,424.

Explain the method of calculating reactances with iron core and air return circuit, such as are used for feeder protection.—POSTULATOR.

An award of 10s. is given to "L. R." who says:—

The size of feeder reactances depends mainly on the capacity of the feeder compared with the generator or generators, and the breaking capacity of the feeder circuit-breaker. For example, if the feeder is rated at one-quarter the generator, a reactance of 3 per cent. in the feeder will pass no more current than a total reactance of 12 per cent. in the generator. (The value of the reactance is ordinarily referred to in terms of the percentage drop of voltage across its terminals with full-load current flowing.) In the case of several generators in parallel, the effect of the feeder reactances is proportionately increased, so that unless the total feeder rating is greatly in excess of the generator rating, the total kilowatt capacity of the feeder reactances may be less than that of the generator reactances, although the number may be much greater. In certain cases it is desirable to group the feeders and use one set of reactances for each group, but if the feeders are of very great capacity compared with the generators, the feeder reactances would be so great that their use might not be justified. Many current-limiting reactances have been designed without iron in the magnetic circuit, but practice now tends to the use of a magnetic circuit partly through iron and partly through air. The construction is practically the same as that of a transformer, and the value of the reactance can be worked out on the usual transformer calculations. The object of having some air in the circuit is to obtain a straight-line characteristic up to, say, 50 per cent. overload. The larger the capacity of a reactance coil and the lower the frequency, the less will be the advantage obtained by using iron in the magnetic circuit. Reactance as it will be understood is the difference between pL and $1/pK$, so that both inductance due to the number of turns and the current flowing has to be considered, and also capacity due to the effect of the metal coils in proximity to one another, forming an air condenser.

The usual formula on which the design is based is the ratio between the square of the number of turns, multiplied by the current multiplied by the area of the leakage path, and the length of the leakage path multiplied by the square of the number of groups, this whole ratio itself being multiplied by a constant depending on the frequency. Sometimes, to modify the value of the reactance, the turns are wound, not evenly, but in groups, which must be taken into consideration.

The effect of variation of frequency can be seen from the following table, which represents a reactance applied to two different frequencies:—

| | Frequency $62\frac{1}{2}$ | Frequency 25 |
|--|------------------------------|-----------------|
| Turns | ... | 34 |
| Reactance in ohms. | ... | 0.227 |
| Reactance per cent. | ... | 10.4 |
| Current in amperes | ... | 1750 |
| Ohmic resistance | ... | 0.00197 |
| Temperature rise full load for three hours | ... | 43.7°C. |
| | | 33°C. |

Thus it will be seen that by increasing the frequency from 25 to $62\frac{1}{2}$ the reactive value has increased from 4.2 per cent. to 10.4 per cent., and the temperature rise has increased by 10° C. In connection with the size of reactance to be employed, it should be remembered that a generator which will give but two or three times full-load current on sustained short circuit may give from 20 to 40 times the full-load current immediately it is short-circuited. If now the value of the reactance of the generator armature be 5 per cent., there may be a flow of 20 times the normal current on short-circuiting, and if reactance coils be added to give an additional 5 per cent. reactance, this instantaneous rush is limited to 10 times the normal value, but both these values may be very greatly increased in any given case, because the magnitude of the current will depend upon the point of the voltage wave at which the circuit is closed, seeing that when pressure is suddenly applied across the terminals of a choking coil it is now known that the instantaneous rush of current is greatly in excess of that ordinarily expected.

It may be useful to give the working out of a small reactance coil on transformer lines. Consider that the reactive E.M.F. of self-induction is to be 100 volts with 10 amperes at 60 cycles; that the coil has 200 turns of No. 8 B. & S. copper wire of 16 inches length mean turn; the magnetic circuit is 6 sq. ins. in section, 18 ins. mean length of iron of hysteresis co-efficient 2.5/1000. The air-gap section = 10 sq. ins. The resistance of the wire comes to 0.175 of an ohm.

Now $E=4.44 nSN/10^6$ (where n equals periodicity, and N = magnetic flux), whence $N=0.188$ megalines. This gives in an air gap of 10 sq. ins. a maximum density of 188,000 lines per sq. in., or 2920 per sq. cm.

Now 10 amperes in 200 turns = 2,000 effective ampere turns, or 2,830 maximum.

The air gap accounts for practically the whole of the ampere turns.

Now $B=4 \times 3.14 CS/10^6$, whence the length of air gap = 1.22 cm., or 0.48 in. With 6 sq. ins. section and 18 ins. mean length, the volume of iron is 180 cubic ins., or 1,770 cubic cms. The density in the iron = $1,880,000/6 = 313,000$ lines per sq. in., or 4,850 lines per sq. cm.

The loss per cycle is therefore $4,850 \times 2.5/1,000 = 2,220$ ergs., and the hysteretic loss at 60 cycles and 1,770 volume is, = 23.5 watts. At 10 amperes this represents an effective hysteretic resistance of 0.235 ohms. Thus the total effective resistance of the reactive coil which is that resistance added to the resistance of the wire = $0.235 + 0.175 = 0.41$ ohms. Now, writing the effective reactance as wattless E.M.F. divided by total current which is one way of representing it, this reactance is = 10 ohms, and the impedance in ohms. works out at 10.01, and the power factor at 4.1 per cent. The total volt amperes of the reactive coil come to 1,001, and the loss of power (C^2R) = 41.

For further information the following papers can be consulted: I.E.E. Journal, Vol. 52, pp. 254, 512, and 584; Transactions of the American Institution of Electrical Engineers, Vol. 30, p. 1143, and Vol. 31, p. 2015.

No other award is made.

ANSWER TO No. 1,421.

Mr. V. F. Bush writes us:—

"As there seems to be a suggestion that the apparatus described by me is of little practical value, let me state that it was given a thorough test on a large mains system before being sent to you as a solution to the problem. It was quite easy to distinguish between a live and dead cable with the apparatus described. From the wording of the question it was assumed that an H.T. feeder had been made dead in a known duct carrying other H.T. cables which were alive; my contention is that the cables carrying current will give a louder hum in the telephone than the cable which is dead. If there were several ducts and it was not known which one contained the dead cable, then there might be some uncertainty as to the dead cable, as the leakage flux from adjacent cables might give a hum in the telephone when tried over the dead cable, equal to the hum produced by the flux from a cable carrying a very small current. Had I to use the apparatus to any extent, and I had any doubt as to the result, I should, where possible, rearrange the load on the live feeders in question before commencing the test, so that no two cables were carrying the same amount of current; a little thought and trouble in this direction would save one from the unpleasant experience of cutting a live H.T. cable and incidentally save the expense of making the main good again. The triangular search coil is well known to most mains

engineers for the localisation of faults in armoured concentric mains laid direct in the ground, the coil picking up the leakage flux through several feet of earth, and for this reason it is very much too sensitive to be used in the solution of R. McC.'s problem. Regarding Mr. Freeman's remarks, I can only think that his apparatus was open circuited, or the telephone out of order. Of course, it is quite understood that this device will not work on continuous-current mains. I might mention that when stray flux becomes troublesome, if a sheet of soft iron is bent horseshoe shape round the apparatus it will prove effective in making the apparatus more 'selective' to the flux from the cable under test. I am quite sure that it only requires very little care to put the apparatus under discussion to intelligent use."

TEMPORARY GENERATING STATION OF THE BIRMINGHAM CORPORATION

WE referred briefly in ELECTRICAL ENGINEERING, Jan. 7th, p. 9, to the temporary generating station which the Birmingham Corporation have decided to put down to deal with the enormous applications for electric power that are coming in mainly from manufacturers of war material, pending the completion of the large new station at Nethells. The present plant will be sufficient for this winter, and the temporary station is to provide for the winter load of 1915-16. The permanent Nethells station is expected to be ready for the winter of 1916-17. The temporary plant will be of 10,000 kw. capacity, and will be put upon a site adjoining the Nethells works in a way that will not interrupt the contracts there now in hand. We have already detailed the estimated cost of the plant, amounting in all to some £97,000. The following plant has already been ordered:—Six marine-type water-tube boilers from Babcock & Wilcox, Ltd.; two 5,000-kw. turbo-alternators with condensers from the British Westinghouse Electric & Manufacturing Co., Ltd.; and five cooling towers from the Davenport Engineering Co. The rest of the plant for which contracts are yet to be placed comprises coal-conveyors, feed-pumps, piping and valves, switchgear, cables, &c. The cost of the temporary foundations and buildings is estimated at about £10,000, but all the plant with this exception will be incorporated into the Nethells station when the plant therein is sufficiently advanced to permit of its being released. In view of the extreme urgency, the work is being proceeded with, in anticipation of the sanction of the Local Government Board to the necessary loan.

THE LONDON COUNTY COUNCIL POWER SCHEME

AS the time for lodging petitions against private Bills in Parliament approaches, the opposition to the two London Electric Power Bills increases. Local authorities in all parts of the proposed area are passing resolutions in favour of opposition, and so far not one case of support has come to our knowledge.

We have already referred to the position taken up by the Marylebone and Hammersmith Councils. The report of the Electrical Engineer to the former has not yet been published. Mr. Sydney Baynes, the Borough Electrical Engineer at St. Pancras, however, in a report is unsparing with his condemnation of the L.C.C. scheme, which, he says, "presents the greatest display of inefficiency to guard public interests ever committed to print." The second Bill, proposing to incorporate a new company, is "a striking contrast to the L.C.C. Bill in clearness of intent and brevity of description, and is indicative of a businesslike conception of all the circumstances surrounding the complex questions dealt with." He adds that he is given to understand that already many of the London Companies have agreed to exchange their undertakings for London Electric Bonds, and in consequence the Company's Bill may be dropped at a fitting juncture.

The Poplar Borough Council is equally hostile, and agrees with St. Pancras that existing municipal electricity undertakers will find it almost impossible to carry on their undertakings should the L.C.C. Bill pass. Petitions are to be entered against both Bills.

Among other authorities which have decided to oppose are Paddington, Richmond, and Loughton. Conferences are being held by all the county authorities concerned. Already one has been held by the Middlesex County Council, and another is to be held at the instance of Surrey to-day. The Kent C.C. is also asked to convene a conference, and the whole attitude of the local authorities in the counties is one of strong opposition.

Institution Dinner.—The last issue of the *Journal of the Institution of Electrical Engineers* contains the official announcement that there will be no Annual Dinner this session.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Jan. 14th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

26,834/13. Wireless Telegraphy. P. O. PEDERSEN and V. POULSEN. A system of continuous-wave production, with a number of arcs in parallel, in which the distribution of high-pressure current is equalised by inserting one or more condensers connected to each arc in the main oscillation circuit in series with the main condenser. (Three figures.)

29,063/13. Regulation of Converting Plant. B.T.-H. Co. (G.E.C., U.S.A.). Automatic regulators to control the direction and magnitude of the interchange of energy between a continuous-current and an alternating-current system, coupled by a motor-generator, according to the relative loads on the two systems by varying the excitation of the continuous-current machine. (One figure.)

29,562/13. Small Motor. J. F. P. DE LA RIBOISIÈRE and R. LE GRAIN. Motors of specially compact two-pole fully-enclosed design for working sliding windows. (Two figures.)

29,902/13. Wireless Telegraphy. A. F. SYKES and S. FORD. A method of producing continuous oscillations by causing periodic variation in the resistance of a liquid rheostat. A disc provided with a large number of alternate conducting and non-conducting strips rotates rapidly opposite diametrically placed terminal plates immersed in a conducting liquid. (Three figures.)

8,062/14. Metallic Casing. R. McGEOCH. This casing is made from rolled sheet, and corrugations are stamped at each side for reception of the wires, while the centre is left flat to screw to the walls. Elbow and tee joints of special form are stamped from similar sheet. (Seven figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Arc Lamps: STURGES, 5,050/14.

DYNAMOS, MOTORS, and TRANSFORMERS: B.T.-H. CO. and HASTINGS [Motor control] 30,083/13; Soc. ANON. LE CARBONE & GINDRE [Brush leads] 9,468/14.

IGNITION: MASON [Ignition system] 173/14 and 21,823/14.

SWITCHGEAR, FUSES, and FITTINGS: B.T.-H. CO. and HASTINGS [Switching systems] 391/14; LUCAS and EDWARDS [Switches] 3,011/14.

TELEPHONY and TELEGRAPHY: BETULANDER [Automatic telephones] 29,615/13; GALLETTI and GALLETTI'S WIRELESS TELEGRAPH & TELEPHONE CO. [Wireless transmission] 29,712/13; AITKEN and AITKEN [Semi-automatic telephones] 53/14; WESTERN ELECTRIC CO. (Woodward for W. E. CO., U.S.A.) [Impulse control system for automatic exchanges] 3,360/14; BETULANDER [Automatic telephone selectors] 18,076/14.

TRACTION: B.T.-H. CO. (G.E. CO., U.S.A.) [Train control] 29,752/13; WHITE (Sturges) [Electric railways] 10,948/14.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Mr. S. C. Burtholomew read an extremely useful Paper before the Institution of Post Office Electrical Engineers on December 21st. He reviewed our entire knowledge up to date of the problems arising out of the interference of electric power circuits (including railways) with telephone and telegraph lines, and besides giving the general principles upon which both lines should be laid out, he detailed the various methods which had been employed to minimise the disturbance. On ordinary power lines, much can be done in the suitable arrangements of the power circuits themselves. A case is on record in America in which a 140,000-volt line induced a potential of 2,300 volts in a neighbouring telephone line, which was reduced to between 20 and 30 volts on revolving the former. A serious electrostatic disturbance

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

DYNAMOS, MOTORS, &c.: LAMME [Running polyphase motors on single-phase circuits] 22,914/14.

INSTRUMENTS: H. ARON ELEKTRICITÄTS-ZAHLERFABRIK [Meters] 15,644/14; BLATHY [Meters] 24,543/14.

TRACTION: SOC. ANON. DES AUTOMOBILES ET CYCLES PEUGEOT [Car lighting] 23,873/14 and 23,917/14.

MISCELLANEOUS: BOUSSON [Mercury vapour lamps] 24,502/14.

Applications for Suspension of Patents

7,617/10. SPARKING PLUG. L. PONCSZUS (Berlin). The application made by J. H. Meyer, of London, for the suspension of the above Patent has been granted. It relates to a self-cleaning plug consisting of a hollow central electrode in conjunction with a cylindrical outer electrode. Air is drawn through the central electrode and is deflected so as to scour the ignition points, thus cooling and cleaning them thoroughly.

12,871/13. ELECTRIC IGNITION. W. RUTHARDT (Stuttgart). The application for suspension of this patent made by C. A. Vandervell and Co. has been granted. The Patent is for timing devices in magneto ignition gear in which the part carrying the contact to be displaced angularly is moved positively in one direction but tends to return in the other direction by the action of a helical spring lying in an annular groove in the movable part.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:-

1,347/01. TELEPHONY. J. E. KINGSBURY. A long specification with a number of claims describing a method of private branch exchange working.

The following are the more important Patents that have become void through non-payment of renewal fees.

DISTRIBUTING SYSTEMS, CABLES and WIRES, INSULATING MATERIALS, &c.: B.T.-H. CO. and E. B. WEDMORE [Feeder protection] 20,498/08.

DYNAMOS, MOTORS, and TRANSFORMERS: SIEMENS BROTHERS & CO., LTD., H. ALTMANN, and W. LAU [Armature coils] 21,460/07.

INCANDESCENT LAMPS: B.T.-H. CO. (G.E. CO., U.S.A.) [Heating metal filaments in nitrogen to increase their resistance by the formation of a nitride] 21,511/06.

Storage Batteries: H. W. VAN RADEN and C. B. ROBINSON [Spun glass battery plate separators] 21,472/06; H. W. VAN RADEN, C. B. ROBINSON, and M. METZ [Battery plates] 21,719/06; J. P. COOK and E. SOKAL [Battery plates] 21,646/07; VAN RADEN & CO., C. B. ROBINSON, and M. METZ [Battery plates] 2,728/08.

SWITCHGEAR, FUSES, and FITTINGS: T. G. HOWE & F. H. TAYLOR [Switch-plugs] 22,385/09.

TRACTION: H. PIEPER [Petrol-electric vehicles with independent drive for the two driving wheels] 23,172/05; J. W. TAYLOR [Brake and collecting shoes] 20,472/08; SIEMENS BROTHERS & CO., LTD., and M. G. FERRIERA [Railway signalling] 20,601/08.

MISCELLANEOUS: H. C. HUBBELL [Miners' lamps] 21,675/06; M. HANKIN & F. WOLFF [Powder resistances] 20,352/08; E. B. COUSANS [Organ blowing] 22,258/09; F. ECKERSLEY and W. CRESWICK [Electric coal cutters] 22,432/09.

can also be produced by the third harmonic currents in the case of lines connected to earthed star transformers, as these currents are then identical in direction in all three lines. On tramway lines, although the current is D.C., electromagnetic disturbances have been occasioned, due to the currents from rotaries not being perfectly continuous; the effect is not simply produced by a "ripple" apparently, but by a more complex pulsation which has not been completely investigated. The tramway motor's themselves also cause irregularities, and the author suggests the addition of a choke coil on each car. Methods of arranging single-wire telephone circuits (where these are still in use) to minimise the trouble were also gone into. Single-phase railways afford the most difficult and at the same time the most interesting problem. Intermediate earthed wires as a shield are only partially effective, and the same applies to the Scott method, in which an auxiliary telegraph wire is interposed with a transformer in it, the secondaries of which are connected in the actual telegraph and telephone circuits. Recent modifications of these neutralising transformer systems, however, have been said to have had a very satisfactory effect on some American

lines. A very pretty method is also the "resonant shunt" method, in which a capacity and inductance, dimensioned to be in resonance with the railway frequency, is bridged across the telegraph line. This shunt, however, has itself necessarily a prejudicial effect on the working of telegraph lines at certain speeds; tests made on the L.B. & S.C. Railway showed that "A.B.C." working was impossible, as was also Wheatstone working above certain speeds, so that it can only be deemed a cure at hand speeds. The Paper is an exceedingly valuable one, and we trust that it will be reprinted in *extenso* and issued at an early date.

Some notes on the German airship wireless service are contained in the *Wireless World*. Wireless stations are established at all the German frontier airship stations, forming a continuous chain thirty-three in number all round the country. Few of these stations appear in the official lists, and it is possible that some are of a temporary nature. According to a map given in our contemporary, those on the western frontier are at Cuxhaven, Emden, Rheine, Kempen, St. Vith, Metz, Strassburg, and Mülhausen. With regard to the equipment on the Zeppelins, trials of the *Viktoria Luise* passenger airship in 1913 established continuous communication up to 200 miles, and the sets on the new war craft are said to be more powerful. The aerial consists of a 3-mm. phosphor-bronze wire unwound from a reel to any length up to 750 ft. and allowed to hang down free in the air. The apparatus itself is very compact, and the dynamo is driven off one of the main engines. The weight complete is 150 lb., and wave-lengths from 300 to 1,200 metres can be used. Elaborate precautions are taken to guard against ignition of leaking gas by sparks.

Lieut. A. A. Jane, R.E., "with the Expeditionary Force," has contributed a well-written Article to the January number of the *Telegraph and Telephone Journal*. Formerly, he says, the service in the Army was carried out by the following branches working more or less separately: (a) Telegraphy and telephony, by the Royal Engineers; (b) Visual signalling, by regimental and battalion signallers; (c) Orderlies; and (d) Postal Service. The first three branches have now been combined into what is called the "Army Signal Service." The Army Postal Service remains a separate organisation, but it works in co-operation with the Army Signal Service. The Army Signal Service units are made up as follows:—The signal squadron carries out inter-communications between Cavalry Divisional Headquarters and Cavalry Brigades. It also keeps in touch with General Headquarters by wireless telegraphy. Signal troops carry out inter-communication within Brigades, with Cavalry Divisions or General Headquarters, as may be necessary. Signal companies with Divisions are intended for inter-communication. Finally, air line, cable, and wireless companies carry out inter-communication between General or Army Headquarters and lines of communication. On such lines as between General Headquarters and the advanced bases, Wheatstone automatic is largely used; and for the forward lines connecting General Headquarters with the various Armies, ordinary double-current sounder duplex. From General Headquarters to Cavalry Divisions aerial lines are used for a portion of the way, and for the remainder cable. At present the Cavalry Corps is connected by cable to an intermediate transmitting centre, and vibrators are in use. Wireless also connects the Cavalry Corps with Headquarters. Cable and dispatch riders connect the Divisions with their respective Corps Headquarters. Field air line can be erected at the rate of about five miles a day by a small detachment of non-commissioned officers and men. An insulated field cable can be laid on the ground at the rate of about four miles an hour. The arrangements of the military telegraph rooms in war time are not so rough-and-ready as many people would imagine. Everything in use is designed for the purposes of dismantling and setting up again at a moment's notice, but order prevails throughout. For instance, the double-current Wheatstone duplex sets are now being placed on a baseboard, so that the apparatus can be moved *en bloc*, with the internal wiring intact, and similar arrangements are made in regard to the other apparatus; recently an order given for the removal of the "Central Telegraph Office of the British Army" from one building to another was actually executed within twenty-four hours, without severing a communication. It is difficult to recognise telegraphists during war time, for when they parade for duty they look as good and as keen soldiers as one would wish to meet. They are drawn from T.S., the London Postal District, and from Provincial Offices, and while excellent soldiers, they are no less expert telegraphists. They take their business seriously, and their ready response to all calls made upon them reflects credit on both Services. When business is brisk in the firing lines the wires leading

to them are correspondingly busy. There are no slack periods, for as soon as the "business" houses are closed in the field, the offices at the various bases commence work. Then lengthy indent messages on ordnance and other supplies begin to come in, and Wheatstone working is resorted to. Pressure continues up to 5 a.m., when there is a slight lull for a short time. Then first one and then another circuit "wakes up," and that is the sign that the activities for the day "farther up" have commenced.

Considerable improvements are being made in the telephone service between London and Brighton. An underground cable at a cost of about £100,000 is expected to be completed in three or four months. Hitherto there has been much interference owing to the overhead wires failing through storms. It is the intention to extend this direct telephonic communication with London to other South Coast towns between Brighton and Portsmouth.

ELECTRIC TRACTION NOTES

It is interesting to note from the *Electric Railway Journal* (New York) that the use of the mercury rectifier for heavy traction purposes is now an accomplished fact. A Westinghouse equipment intended for a locomotive for running off an 11,000-volt single-phase line with four D.C. 1,000-h.p. motors is now running on a branch line of the New York, New Haven & Hartford Railway, and has already covered over 20,000 miles. The high-tension is led into a transformer, the secondary of which is provided with a centre tap and with a number of others equally spaced two by two from the centre on both sides to permit the varying of the A.C. voltage from zero to the maximum. The centre tap connects with the terminal of a group of four 600-volt motors connected permanently in series-parallel. The group is earthed at the centre. The outside secondary transformer terminals connect to the two positive electrodes at the top of the rectifier. The remaining connection is from the mercury or negative terminal of the rectifier to the other terminal of the motor group. The rectifier consists of a light steel cylinder container approximately of 20-in. diameter and 36-in. height. The electrodes enter at the top of the container through air-tight insulating bushings, projecting a short distance into the cylinder. The arc is started by means of a small motor-generator exciter. No external reactance is needed on the D.C. side, as the motors furnish ample reactance for the purpose of steadyng the current. The voltage-drop in the rectifier is about 25 volts.

Modern Electric Lighting.—A Paper with this title was read by Mr. H. C. Wheat at a recent meeting of the Rugby Engineering Society. The author pointed out the great possibilities that were opened up by the use of metal filament lamps in conjunction with suitable reflectors to direct the light where it was wanted, and explained the main principles of illumination and the action of light on the eye, emphasising the harmful effects of glare due to the high intrinsic brilliancy of modern illuminants, and the necessity for adequate diffusion. The principle requirements were that the lamps should be equipped with some form of reflector or diffuser, to re-direct the light where required; this reflector should also act as a shade to protect the eye from the naked filament, or, if a diffuser, it should reduce the intrinsic brilliancy to an agreeable value. Any reflector employed should have a surface as large as practicable, and of such a nature as to avoid striations. For general lighting the lamps should be placed high, to remove them from the line of vision to secure more natural and agreeable effects, and to foreshorten the shadows. He described several commercial forms of reflecting shades, and passed on to describe the measurement of illumination and candle-power. A most important factor in determining the illumination produced in a room was the colour of the walls and ceiling, which determined the amount of light reflected. In conclusion, the differences between the direct, diffused, indirect, and semi-indirect systems of lighting were explained, and the advantages of indirect lighting when carried out with suitable reflectors were insisted upon.

The Central.—The December issue of this magazine of the old students of the City and Guilds (Engineering) College contains among other articles one by Mr. Percy Good on the efficiency of radiators. Polar curves of the distribution of radiation as measured by a thermopile are given, and the total hemispherical output of radiant heat deduced. The red-hot fire type of radiator was found to have a better efficiency than the lamp type, but the lamp radiator as shown by time curves, heated up much quicker than the "fire." Another article describes a new pattern of induction coil designed by Mr. W. H. Wilson. There are also many interesting notes as to the doings of old "Centralians."

"ELECTRICAL ENGINEERING" TRADE SECTION

CATALOGUES, PAMPHLETS, &c., RECEIVED

CEILING ROSES.—A new list of ceiling roses has been issued by A. P. Lundberg & Sons (477 to 489 Liverpool Road, N.), which contains a very large number of designs, including the "biflex, triflex, quadriflex, and multiflex" patterns, with two, three, four, and more contact plates respectively separated by porcelain partitions. Of the special roses, a very convenient arrangement is the detachable rose in which the flex is connected to two-pin plug, enclosed by the ordinary cover, which can be removed when desired to disconnect the fitting without disturbing the wiring in any way. Another special device is a combined ceiling rose and plug socket. The uses to which all the varieties of roses can be put are very fully explained in the list.

MOTOR HIRING.—A card from Electro-Motor Hiring, Ltd. (Green Mount, Pellon Lane, Halifax), calls attention to the motor hire-purchase system initiated by this firm.

STAGE LIGHTING.—A number of forms of stage arc lamps, ordinary flame arc lamps, bunch lights, stage plugs, dimmers, battens, and other fittings for theatre lighting, are dealt with in a comprehensive list devoted to this class of apparatus from Austin Walters & Son (57 Lower Mosley Street, Manchester), who have also sent us a copy of their list of electric signs.

OSRAM LAMPS.—A very pretty bookmarker from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.) asks us to enjoy our reading with an Osram lamp.

HAND LAMPS.—A leaflet from the General Electric Co. lists a number of patterns of torches, pocket lamps, and hand lamps with dry batteries, and a bed reading lamp mounted on a bracket, to be strapped to the bed-post.

CALENDARS, &c.

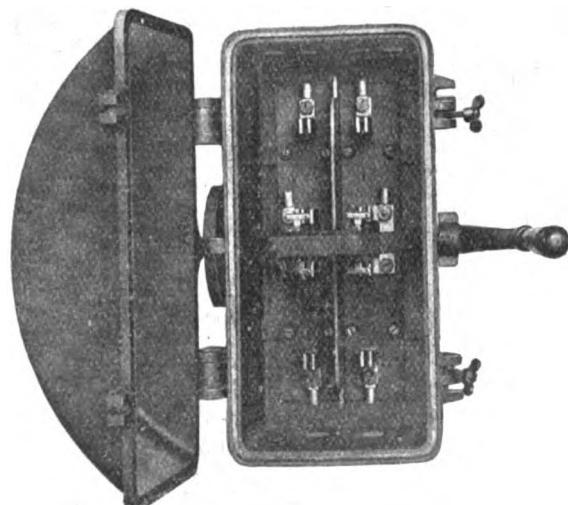

A neat little brass table calendar with daily cards for an office table has been sent us by the Edison & Swan United Light Co., Ltd. (Ponders End, Middlesex, and 125 Queen Victoria Street, E.C.).

A patriotic wall calendar decorated with a Union Jack is being sent out by Motor Hiring, Ltd. (Green Mount, Pellon Lane, Halifax).

A neat little pocket calendar, serving also as an inch and millimetre scale, is being distributed by the Key Engineering Co. (4 Queen Victoria Street, E.C.).

IRONCLAD CHANGE-OVER SWITCHES

ONE of the latest additions to the range of ironclad mistake-proof switchgear which is being developed by the General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, E.C.), is the change-over switch

"WITTON" IRONCLAD INTERLOCKED CHANGE-OVER SWITCH.

illustrated here, which is primarily intended for use in cinematograph theatres for changing over rapidly from one lantern to the other. It is equipped with an interlock which renders it impossible for the cover to be open whilst the switch is in the "on" position, or for the switch to be closed

whilst the cover is open, and, in accordance with L.C.C. requirements, the hinge does not carry current, so that the blade is dead when the switch is off. The break also complies with the Glasgow Corporation rules. Every facility for wiring is provided, and the cables are laid straight into the sweating sockets, which are placed exactly opposite the bushed inlet holes.

THE COOLIDGE RÖNTGEN RAY TUBE

THE Röntgen ray tube with heated tungsten cathode which has been developed in America by Dr. W. Coolidge is now on the market in this country, and an interesting pamphlet thereon has been issued by the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.). This tube has the great advantage that the character of the rays emitted does not depend upon the degree of vacuum. The vacuum is made permanently as perfect as possible, and the cathode is electrically heated to a point where it throws off electrons when the tube becomes conductive and is used in the ordinary way. A view of the complete tube is shown in Fig. 1, and the details of the electrodes are shown enlarged in Fig. 2. The heated tungsten

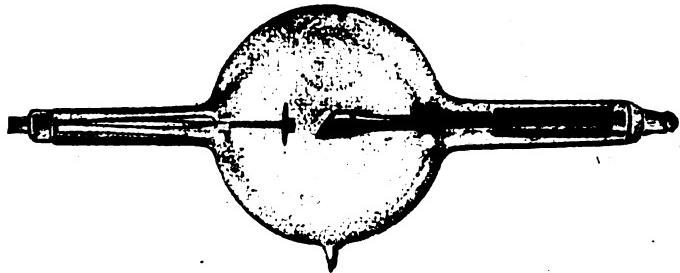

FIG. 1.—COOLIDGE RÖNTGEN RAY TUBE.

coil (1) forms the centre of the cathode, and is surrounded by a tungsten tube, 11, which has a focussing action and causes the cathode rays to infringe upon a definite spot on the tungsten target, 15. The use of a hot cathode greatly changed the characteristics of the tube, doing away entirely with puncturing troubles, with movement of the focal spot, local heating, and fluorescence of the active hemisphere, and with the emission of troublesome X-rays from the glass. The discharge current carried by the tube when a definite potential is impressed upon the terminals may be increased or decreased at will, and with it the intensity of the X-rays produced, as these depend only on the temperature of the heated portion of the cathode. The penetration of the X-rays produced may be instantly increased or decreased at will by raising or lowering the

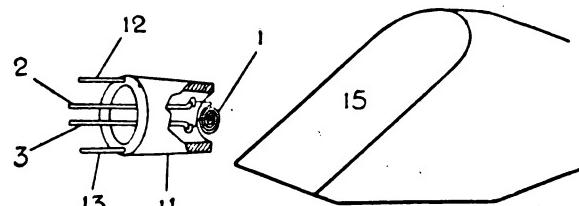

FIG. 2.—ENLARGED VIEW OF ELECTRODES.

potential difference impressed upon the tube. Thus not only is a large amount of adjustment eliminated, but a single tube can be used to do a variety of work requiring rays of greatly differing penetrative power. Exact duplication of results is possible, and the tube has a stability, fixity of focal point, life, and power unapproached by older patterns.

The "hardness" of the rays is varied by regulating the current through the tungsten filament, which is supplied by a small insulated local storage battery. We understand that a number of these tubes are in use at the hospitals at the Front, and there are hopes that the rays of great penetration produced may enable the tube to replace the use of radium in certain therapeutic work. Owing to the rectifying action of the tube, either alternating or continuous current can be employed.

MARINE TELEPHONES

A SERIES of special designs of loud-speaking telephones for shipboard work has been standardised by Siemens Brothers & Co., Ltd. (Woolwich), and the latest patterns are described in an illustrated catalogue which has just been issued. In this form of telephone the loudness of speech is not obtained by passing a heavy current through the microphone, but by a special system of connections which requires only a current of about 0·07 amp. in the microphone. The transmitter at one station is in series with the receiver at the other station, and the transmitter at the second station in series with the receiver at the first station, with a common

MARINE LOUD-SPEAKING TELEPHONE.
MERCHANT SERVICE PATTERN.

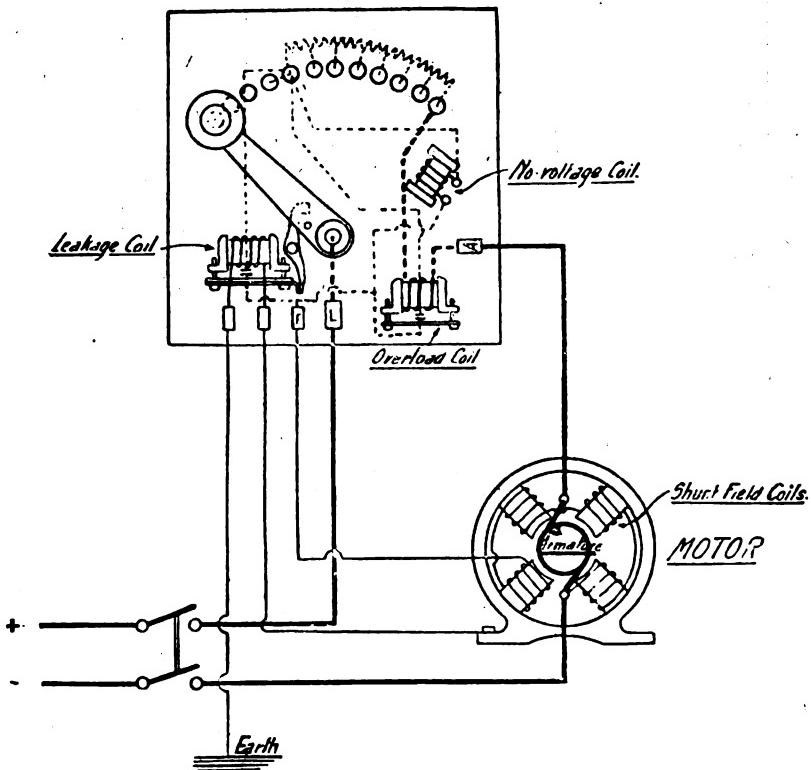

line for return. The source of supply is inserted as a bridge between the common return and the two lines connecting the transmitters and receivers through small inductances, which prevent the speaking current from passing, but allow the microphone feeding currents to pass readily. Hence, fluctuations of the current due to the action of the transmitters pass directly through the receiver without passing through the source of supply. This increases the clearness of speech and also the loudness with a smaller current flowing. The microphone is perfectly watertight in a capsule form, this being made possible by using a diaphragm of metal instead of carbon, as is usual. The watertightness of the microphone is very important, as the slightest moisture on the carbon granules impedes their action and prevents clear speaking. The capsules are also enclosed in the watertight case of the instrument, but should the lid of the case by accident be left not watertight, the essential parts of the telephones are not thereby damaged. The instruments are arranged for working off a 15-volt circuit, but will work quite satisfactorily on circuits with pressures between 12 and 20 volts. The necessary current for working can be obtained either from the ship's lighting mains by means of a potentiometer resistance, or by primary or secondary batteries.

The special naval patterns include a side-tube type somewhat similar to that illustrated, fire control and cabin types, with hand combination sets, and a headgear and breastplate set. A metal-cased design of exchange board is made for use with these instruments.

There are also a number of patterns to meet the requirements of the merchant service, including the side-tube instrument shown above. These and other patterns can be conveniently mounted in pillars or cases for attachment to bulkheads, and a strong ironclad selector switch-box can be used to provide a complete intercommunication system.

LEAKAGE PROTECTION FOR MOTORS

IT is possible for a small motor breaking down to earth to bring out the main circuit-breaker which is supplying the whole group of motors, and thereby to cause a complete shut-down of a large portion of a works. A device which precludes such an undesirable contingency can be fitted by the General Electric Co., Ltd (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.) to their standard continuous-current motor-starters. Using this device the motor is completely insulated from earth, except through the usual earthing conductor, in series, with which is inserted a low-resistance trip coil. When a leakage occurs to earth the current flowing through this trip coil actuates a

THE JOWERS LEAKAGE PROTECTION SYSTEM FOR MOTORS.

mechanism which short-circuits the no-volt coil if the motor be running, and trips the starter, thereby shutting down the motor. Alternatively, if the motor be standing, the leakage current actuates a catch, which holds back the starter arm if an attempt be made to run the motor up. The connections for this device are shown above. The addition of the coil to a "Witton" starter introduces practically no complications.

CORRESPONDENCE

REDUCED STREET LIGHTING.

To the Editor of ELECTRICAL ENGINEERING.

SIR.—We have seen the illustration and description of a reflector in your issue of Dec. 31st, which is claimed to be an innovation, inasmuch as it is designed to eliminate upward rays and give wide distribution of light on the ground. We would like to point out that there is nothing new in this, we having used this principle for a long time now, and we enclose

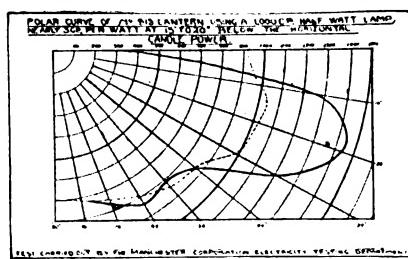

FIG. 1.

herewith an illustration (Fig. 2) of our No. 515 Primus lantern, from which will be seen that the filament does not project below the bottom of the internal reflector. The polar curve (Fig. 1) taken by the Manchester Corporation Testing Department, shows an increase of nearly 50 per cent. of the candle-

Just as an English oak laughs at storms, so do I withstand jolts and jars. A heart of oak is good—a filament of drawn tungsten wire is good—there you have the reasons why both of us are strong. That drawn wire filament was a great idea; it said "Never more" to weak lamps. Yes! I'm Mazda—the original drawn wire lamp—the development work took place in my glass bulb and the first drawn wire lamps put on the market bore my name. Mine is the kind of strength users want. If you sell lamps, sell me; if you use lamps, you have some lamp-holders I should be in. I'm Mazda.

power at 17° below the horizontal, which is a far more useful ray for street lighting purposes than the 30° shown in the curve in your issue of Dec. 31st. For instance, if the height of the lantern is 25 ft., the 17° ray will reach a radius of 80 ft., whereas the 30° ray will only reach a radius of 44 ft. To

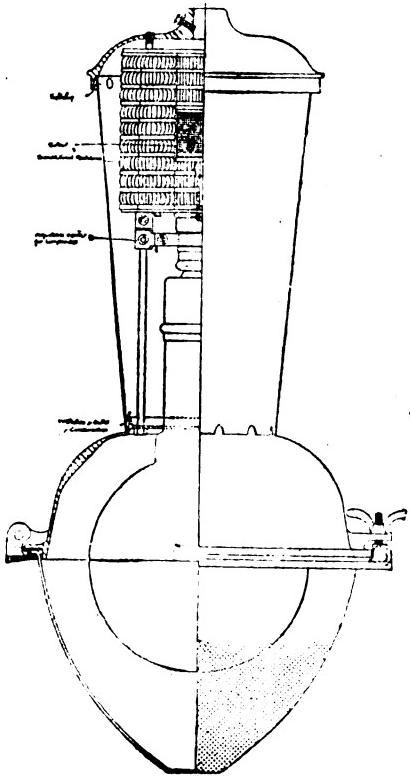

FIG. 2.

obtain even illumination it is very important to get the maximum candle-power very near to the horizontal, but this is very difficult if upward rays and glare are to be eliminated.

Yours faithfully,

THE WARDLE ENGINEERING CO., LTD.,
196 Deansgate, Manchester.
Jan. 11th, 1915.

AN AMUSING MISTAKE

A RATHER amusing incident occurred on Sunday last at the Ediswan Works, Ponders End. Mr. W. Deeley, one of the staff, was asked by the Advertising Department to take a photograph of the new glasshouse which has just been erected. He chose Sunday, doubtless thinking the better the day the better the deed; and in order to get a good view, crossed the river and was proceeding to get his picture from

the river-bank. Another employee being keen on spies, having just been training his eye on the Ediswan rifle range, spotted what he thought was a "spy" photographing the works. Fearing to fire in case of aiming straight, he decided to inform the police by telephone. Within two minutes a sergeant on a bicycle came speeding along the river-bank, and placed the "spy" under arrest pending reinforcements,

which arrived in the shape of a constable, also on a bicycle. The "spy," seeing that resistance was futile, asked his captors to accompany him across the river in the ferry boat, where, upon landing, they were met by the foreman of the glass-houses, who enjoyed the situation he found his colleague in. However, after identification, the prisoner was released, and an *entente cordiale* was formed, which is illustrated here.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Australia.—The Melbourne, Brunswick & Coburg Tramways Trust requires sub-station equipment, three-core H.T. cable, as well as tramway line material.—The Prahran & Malvern Tramways Trust (Melbourne) requires a booster and switchgear.—Specifications and forms of tender in both cases at 73 Basinghall Street, E.C.

Barrow-in-Furness.—The Borough Electrical Engineer has reported that it will be necessary, at an early date, to consider further extensions.

Beebles.—An electric lighting scheme is under discussion.

Beckenham.—A 120-kw. generating set and switchgear. Borough Electrical Engineer. Jan. 25th.

Blackrock.—A L.G.B. inquiry is to be held concerning a loan for the electric light scheme. Messrs. May & Hawes are the consulting engineers.

Bolton.—A new sub-station is to be erected at Bradshawgate.

Dundee.—A 15-ton overhead travelling crane for the Walton sub-station. Chief Electrical Engineer.

Greenock.—A loan of £30,000 has been granted for electrical extensions.

Harrogate.—Loans of £600 for services and £500 for transformers are to be applied for.

Hove.—The Borough Electrical Engineer recommends the installation of a 500-kw. steam turbine, with switchgear; a 115-cell battery and two battery boosters. He also recommends the fitting of superheaters to the existing boilers. The estimated cost is £6,970.

Redditch.—Two 1,000-kw. turbo-alternators with condensers, cooling tower, &c., and two synchronous motor-alternators (300 and 150 kw. respectively). Consulting Engineers, Handcock & Dykes, 11 Victoria Street, S.W.

Spain.—The list of goods required by the Spanish Government Departments, and in the supply of which foreign competition will be permitted during 1915, includes generating plant, lamps, searchlights, measuring instruments, laboratory apparatus, and submarine cables. The full list may be seen at 73 Basinghall Street, E.C.

Truro.—A loan of £10,000 in connection with the Council's electric lighting scheme is to be applied for.

Wiring

Warrington.—Electric lighting and bell installation, Oakwood Avenue Council School. Secretary, Education Offices.

Whitstable.—Workhouse.

Miscellaneous

Cardiff.—An expenditure of £7,000 is to be incurred upon doubling certain tramway tracks.

Halifax.—General supplies for Electricity Department. Borough Electrical Engineer. Feb. 15th.

Leeds.—General supplies for Electricity Department. Manager. Feb. 20th.

Worsley.—Extensions are to be carried out to the street lighting.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

London: Bethnal Green.—The following tenders for cable in connection with the supply to be taken from the Stepney Borough Council have been received:—British Insulated & Helsby Cables, £12,498 14s.; W. T. Henley's Telegraph Works Co., £12,586 5s.; Johnson & Phillips, £12,618 9s.; Siemens Bros. & Co., £12,661; Western Electric Co., £12,734 5s.; Cal-

lender's Cable & Construction Co., £12,887; W. T. Glover & Co., £12,942 15s.; and the Union Cable Co., £12,948 11s. The first-named tender is recommended for acceptance subject to the sanction of the L.G.B. to the necessary loan. The Council has also accepted the tender of the Westinghouse Co. for static transformers and sub-station switchgear. Mr. H. W. Couzens is the consulting electrical engineer.

APPOINTMENTS AND PERSONAL NOTES

Messrs. Preece, Cardew & Snell, consulting engineers (3 Queen Anne's Gate, S.W.), are taking into partnership Mr. J. H. Rider, who is retiring from his position of consulting electrical engineer to the Central Mining and Investment Corporation, Ltd. (Johannesburg). The partners will then be Mr. A. H. Preece, Sir John Snell, Mr. Llewellyn Preece, Mr. J. H. Rider, Mr. J. H. Woodward, and Mr. S. S. Moore Ede. The firm will be known as Preece, Cardew, Snell & Rider.

Mr. J. Collinge has been appointed Station Superintendent at the Salford Electricity Works.

Mr. John A. Parker, Chief Assistant at the Greenock Electricity Works, has been appointed Chief Assistant at the Croydon Electricity Works. There were 187 applicants.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £64 5s. to £64 15s. (last week, £63 10s. to £64).

Australian Agency.—An Australian firm already representing several British manufacturers wishes to take up agencies for dynamos and motors, electrical accessories, cables and flexible wire, &c. Further particulars at 73 Basinghall Street, E.C.

Liquidations.—The Helsby Wireless Telegraph Co. is to be wound up voluntarily. Mr. J. B. Edwards, 25 Victoria Street, London, S.W., is liquidator. A meeting of creditors will be held on Jan. 23rd at the offices of Messrs. Kenneth Brown, Baker, Baker & Co., Lennox House, Norfolk Street, W.C., at 12 noon.

Mr. G. E. Corfield has been appointed liquidator (with a committee of inspection) of the Leitner Electrical Co., Ltd.

LOCAL NOTES

Bath: Diesel Engine.—It is recommended by the Electric Lighting Committee that Messrs. Mirrlees, Bickerton & Day inspect the Diesel engine and report as to the cost of altering it. The fee for this is to be 20 guineas, on the understanding that if the Council places the contract with the Company no charge will be made.

Edinburgh: Electric Wiring.—Notwithstanding the reputation of electrical contractors, referred to on p. 3 of our issue for Jan. 7th, a few verbal alterations only are proposed. These are to be submitted to the trade, and the clauses will be again considered at another meeting.

Luton: Delayed Plant.—A number of firms in Luton who are working on urgent War Office contracts are complaining of inability to obtain the necessary supply of electricity. Mr. W. H. Cooke, the Borough Electrical Engineer, states that he has been quite unable to obtain delivery of plant ordered more than twelve months ago, as the makers are too busy upon Government work themselves. The War Office, in August, facilitated the delivery of the turbines and water-tube boilers by allowing them to be consigned as military stores, but a similar permission with regard to other materials, including coal, was not granted. As the War Office has drawn the attention of the Corporation to the effect of the delay in the supply of current, the Borough Electrical Engineer suggests that pressure should be brought

to bear upon the makers of the missing plant by the War Office in order to facilitate delivery.

Sheffield: Showroom Opposition.—The local electrical contractors took the opportunity afforded by a L.G.B. inquiry on Saturday concerning a loan for new offices and electricity showrooms to oppose on the general question of the Municipal Sales Department. The Corporation claimed to have the power to erect showrooms, but the inquiry was necessary as it is proposed also to erect shops for letting in order to fill up the available land. The local contractors were represented by counsel, who contended that the Corporation is not entitled to run a showroom, and that the existing premises in Commercial Street are large enough if the showroom was done away with. The Inspector said he could hardly agree, and expressed the opinion that the existing accommodation was rather "poky" for a place like Sheffield. It was intimated that proceedings are to be taken by the contractors against the Corporation on the question of the Sales Department.

Institution of Electrical Engineers.—The following is the result of the ballot for new members, and the transfer of members from one class to another at the meeting last Thursday:—
Members: E. E. de Souza, R. N. Vyvyan. *Associate Members:* F. Blair, T. W. Bridger, H. R. Climie, A. C. Fuller (Capt., R.E.), D. S. Laurie, W. L. Parker. *Associate:* D. G. Harris. *Graduates:* S. J. Atkins, J. C. Briggs, W. J. M. Dawson, G. T. Edgar, T. J. Fairfield, C. Grover, S. B. Houghton, H. D. Kemp, E. Lewis, D. Little, C. J. McGuinness, G. T. Manley, W. H. Pettifor, C. W. W. Prescott, P. T. Rose, H. N. Winter. *Students:* W. M. Baxter, C. H. Brazel, C. P. Chowna, N. H. Cole, W. Dancy, B. Dowerah, H. Doyle, C. D. Farmer, A. R. Fiske, W. A. Ford, P. Freedman, C. C. Garland, O. W. Grainger, W. J. John, J. W. Jones, L. J. Jones, P. C. Kerr, D. H. C. Lye, W. G. Messer, L. E. R. Murray, J. F. W. Needham, A. M. Parkinson, J. G. Pearce, M. R. R. Rau, G. A. Rendle, F. H. Schroeder, J. E. Sheldrick, G. C. Stevens, M. B. Tirunarayanan, M. V. P. Vaidya.

Candidates transferred from Associate Member to Member: J. A. Anderson, A. O. Buckingham, H. G. Solomon. *From Associate to Member:* M. K. Esskildsen. *From Associate to Associate Member:* A. Johnston. *From Graduate to Associate Member:* C. J. Brady. *From Student to Associate Member:* L. F. Burgess, A. Collins, F. C. Dannatt, M. Dewhurst, G. W. Edward, G. Hartley, A. Hutt, R. R. G. Mann, G. C. Marris, A. H. Munro, J. A. Rutherford, A. G. Savill, J. H. Shannon. *From Student to Graduate:* J. F. Daniels, R. Dods, E. F. James, G. T. Medforth, P. S. Rao, T. Riley, L. W. Smith, P. Wardle, A. Welch, D. S. Wood (Qtmr., R.A.M.C. (T.))

Charging for Current for Photo Printing.—Referring to the article on this question on page 12 of ELECTRICAL ENGINEERING, January 14th, Mr. H. Faraday Procter writes us further as follows:—"I notice that the legal correspondent of the *Municipal Journal*, in the issue of the 15th January, states that 'he is unable to change his opinion,' but by his own words he admits that my contention is right, viz.: That the ultimate purpose for which electrical energy is used is to be taken into consideration in determining whether such use is lighting, power, or heating. In the issue referred to he says: 'But in law and in fact such undertakings do charge according to whether the energy is for lighting or power. A reference to the analytical tables in the Municipal Year Book shows this beyond dispute.' I may only add that it is equally beyond dispute that electrical energy used for photo printing is not 'energy for lighting' or to employ the more correct term, 'for illumination purposes.'"

The Aerial Raid on the East Coast.—One of the precautions that was taken during the raid by German aircraft on Tuesday night at Yarmouth, and probably at other towns also, was the cutting off of the electric supply entirely from the electricity works, in order to plunge the town as much as possible into darkness. The trams were left stranded until the next morning. Incidentally the possibility of doing this brings out an advantage of electric lighting over gas, as such a course would be attended with great danger in the case of gas, as the supply could only be restarted with safety after a full investigation that every tap on consumers' premises was closed. The importance is also shown of running all local searchlights, &c., off independent plant. As far as we know on going to press no damage was done to electricity works at any of the towns visited, but here and there telephone lines are reported to have been brought down by the force of the explosions.

Displayed Advertisements, Tuesday first post.

Corrections in Standing Advertisements, Monday first post.

All letters to be addressed to "Electrical Engineering," at the EDITORIAL AND PUBLISHING OFFICES: 203-206, TEMPLE CHAMBERS, LONDON, E.C.

Telegrams: "Circling, Fleet, London." Telephone No.: 5509 Holborn

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

SUMMARY

THE shortage of coal at some electricity works is very serious. Some London works have recently been left with only three or four days' stock and are living from hand to mouth (p. 34).

THERE is no truth in the report that the electricity works in London will extinguish all lights in the event of an air-raid. Definite instructions are to be given that the electricity supply is to be maintained at full pressure (p. 34).

THE Electrical Contractors' Association will put into effect on Oct 1st, 1915, a scheme by which the work carried out by its members shall bear the Association's guarantee (p. 34).

WE deal further with the Ilford case. The Gas Co. is endeavouring to secure a surcharge of the amount of money spent upon hiring of motors, arc lamps, etc., and also upon the wiring of premises (p. 34).

A DISCUSSION on searchlights was opened by Mr. P. G. Ledger at the last meeting of the Illuminating Engineering Society. Some interesting information was given and also details of improvements made in America (p. 35).

THE measurement of three-phase power by wattmeters is discussed in our "Questions and Answers" columns (p. 36).

AMONG the specifications published at the Patent Office last Thursday is one of the B.T.-H. Co. for train control with regenerative braking. Others deal with wireless transmitting apparatus and searchlight

lamps. A patent for a method of manufacturing graphite in the electric furnace expires this week after a full life of fourteen years (p. 37).

A MOVE is being made towards the standardisation of private branch telephone exchange boards (p. 38).

SOME further details of the recent accident in the New York subway appear in our Electric Traction notes, and also particulars of the arrangement made by the London County Council for the supply of a further 3,500 kw. by the London Electric Supply Corporation for the tramways (p. 38).

ARTICLES in our Trade Section deal with motor converters, electric heaters, an adaptor for heating circuits, and a lantern for half-watt lamps (p. 39 and 41).

THE B.E.A.M.A. have issued the first number of a quarterly journal (p. 41).

AN expenditure of £55,000 is contemplated at Islington; a new battery is required at Grimsby; arc lamp carbons at St. Pancras; mains and sub-station plant at Southend; generating plant for the Barnet Guardians; mains, services, switchboard, and meters at Cleethorpes (p. 41).

THE Edinburgh Corporation has decided not to proceed with its application for municipal wiring powers.—The Southampton Electricity Committee is recommended not to change its "Point-Five" policy.—It is possible that the Stafford Electricity and Gas Departments will be placed under separate management.—A central stores is recommended for the Trading Departments at Southport.—The Hampstead electricity department has found itself with only three days' supply of coal (p. 42).

Osram Patent Litigation.—Before Mr Justice Warrington yesterday morning, it was announced that the Corona Lamp Works, Ltd., had agreed to an injunction against them for infringement of Patent No. 23,899 of 1904, and had already paid £1,000, to cover damages and costs, to the Osram Lamp Works, Ltd., the proprietors of the patent.

Arrangements for the Week.—(To-day) Thursday, Jan. 28th.—Institution of Electrical Engineers. Sixth Kelvin Lecture. "Lord Kelvin's Work on Gyrostatics," by Prof. A. Gray, F.R.S., 8 p.m.

Friday, Jan. 29th.—Institution of Electrical Engineers, Birmingham Section, University. Prof. Gray will repeat the Sixth Kelvin Lecture, 7.30 p.m.

Institution of Electrical Engineers, Newcastle Section, Technical College, Darlington. "The Development of Static Substation Design on the North-east Coast," by R. W. Gregory, 7.30 p.m.

Royal Institution, Evening Discussion, "Gaseous Explosions," by Dr. Dugald Clerk, 9 p.m.

Junior Institution of Engineers, 39 Victoria Street, S.W. Discussion on "London's Future Electricity Supply," 8 p.m.

Saturday, Jan. 30th.—Association of Engineers-in-Charge, St. Bride's Institute, Fleet Street, E.C. Discussion on "English v. German Superiority of Business Methods," 8 p.m.

Wednesday, Feb. 3rd.—Institution of Electrical Engineers. Students' Section, Victoria Embankment. "High Explosives," by H. Williams, 7.30 p.m.

Thursday, Feb. 4th.—Greenock Electrical Society, 21 West Stewart Street. "Illumination," by F. B. Humphriss.

lender's Cable & Construction Co., £12,887; W. T. Glover & Co., £12,942 15s.; and the Union Cable Co., £12,948 11s. The first-named tender is recommended for acceptance subject to the sanction of the L.G.B. to the necessary loan. The Council has also accepted the tender of the Westinghouse Co. for static transformers and sub-station switchgear. Mr. H. W. Couzens is the consulting electrical engineer.

APPOINTMENTS AND PERSONAL NOTES

Messrs. Preece, Cardew & Snell, consulting engineers (3 Queen Anne's Gate, S.W.), are taking into partnership Mr. J. H. Rider, who is retiring from his position of consulting electrical engineer to the Central Mining and Investment Corporation, Ltd. (Johannesburg). The partners will then be Mr. A. H. Preece, Sir John Snell, Mr. Llewellyn Preece, Mr. J. H. Rider, Mr. J. H. Woodward, and Mr. S. S. Moore Ede. The firm will be known as Preece, Cardew, Snell & Rider.

Mr. J. Collinge has been appointed Station Superintendent at the Salford Electricity Works.

Mr. John A. Parker, Chief Assistant at the Greenock Electricity Works, has been appointed Chief Assistant at the Croydon Electricity Works. There were 187 applicants.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £64 5s. to £64 15s. (last week, £63 10s. to £64).

Australian Agency.—An Australian firm already representing several British manufacturers wishes to take up agencies for dynamos and motors, electrical accessories, cables and flexible wire, &c. Further particulars at 73 Basinghall Street, E.C.

Liquidations.—The Helsby Wireless Telegraph Co. is to be wound up voluntarily. Mr. J. B. Edwards, 25 Victoria Street, London, S.W., is liquidator. A meeting of creditors will be held on Jan. 23rd at the offices of Messrs. Kenneth Brown, Baker, Baker & Co., Lennox House, Norfolk Street, W.C., at 12 noon.

Mr. G. E. Corfield has been appointed liquidator (with a committee of inspection) of the Leitner Electrical Co., Ltd.

LOCAL NOTES

Bath: Diesel Engine.—It is recommended by the Electric Lighting Committee that Messrs. Mirrlees, Bickerton & Day inspect the Diesel engine and report as to the cost of altering it. The fee for this is to be 20 guineas, on the understanding that if the Council places the contract with the Company no charge will be made.

Edinburgh: Electric Wiring.—Notwithstanding the deputation of electrical contractors, referred to on p. 3 of our issue for Jan. 7th, a few verbal alterations only are proposed. These are to be submitted to the trade, and the clauses will be again considered at another meeting.

Luton: Delayed Plant.—A number of firms in Luton who are working on urgent War Office contracts are complaining of inability to obtain the necessary supply of electricity. Mr. W. H. Cooke, the Borough Electrical Engineer, states that he has been quite unable to obtain delivery of plant ordered more than twelve months ago, as the makers are too busy upon Government work themselves. The War Office, in August, facilitated the delivery of the turbines and water-tube boilers by allowing them to be consigned as military stores, but a similar permission with regard to other materials, including coal, was not granted. As the War Office has drawn the attention of the Corporation to the effect of the delay in the supply of current, the Borough Electrical Engineer suggests that pressure should be brought

to bear upon the makers of the missing plant by the War Office in order to facilitate delivery.

Sheffield: Showroom Opposition.—The local electrical contractors took the opportunity afforded by a L.G.B. inquiry on Saturday concerning a loan for new offices and electricity showrooms to oppose on the general question of the Municipal Sales Department. COAL

THE question of the supply of coal to electricity works has become serious. We refer not to the price of coal (which, it is true, has risen very seriously), but to the actual question of obtaining coal in sufficient quantities to keep the electricity works going and the electric lighting continuous. Some of the electricity works have already been very nearly at the end of their stocks, some actually, with only 3 or 4 days' stock in hand, have been living from hand to mouth. Those with a fortnight's supply are considered to be in a comfortable position.

The works experiencing the greatest difficulty are those which are arranged to receive sea-borne coal only. Many colliers have, of course, been requisitioned by the Admiralty, and there is also great delay owing to the fact that in certain places the colliers are not allowed to be loaded during night. Many also usually anchor at night so that the actual voyage takes longer. We learn that the Admiralty has already agreed to release fourteen of the interned foreign ships specifically for coal traffic to London, but this will only slightly ameliorate the situation. Those electricity works which are arranged for receiving both sea-borne and rail-borne coal have been obliged to fall back on the latter; one London company, for instance, which customarily is provided with coal by water, has been supplied by rail only during the last two and a half months.

The position with regard to supplies by rail, however, is only slightly better, and great trouble is being experienced in getting supplies. Some collieries are only working two or three days a week because they cannot get the coal trucks, and refuse to mine the coal until these are available, for this means dumping the coal on the ground, and in consequence double handling. The railways have instructions from the military authorities to hold definite large quantities of rolling stock and also siding accommodation in reserve, a large amount of the coal for the Fleet has to travel partly by rail, and the labour available at the railway yards is not sufficient. All these things are holding up coal which in the ordinary course would have been in London weeks ago.

We are simply stating facts. While there is no need for any panic, it should be clearly understood that the position is a serious and a difficult one. The authorities, especially the Railway Executive Committee, are, we understand, doing their best to cope with the situation, and we recommend any of our central station readers who are in difficulties as to coal supply to appeal directly to them; the address is 35 Parliament Street, Westminster. Large demands are now being made on the railways by the military authorities, and will presumably be continued to be made for some weeks, so that the Committee will probably be assisted rather than harassed if electricity supply stations keep them well informed in good time of their needs and of the details of the difficulties they have to contend with.

ZEPPELINS AND LIGHT

A REPORT has been freely circulated, but based only on a surmise, that the electricity works in London had had instructions that all lights—both private and public—were to be switched off on the instructions of the Admiralty at the approach of hostile aircraft to the metropolis. We are in a position to state that this report is absolutely without foundation. When the Zeppelins and the German aeroplanes come over London, current will not be shut off from the electricity supply mains; in fact, the instructions issued are in the exactly opposite direction. Every effort is to be made to maintain the supply normal and at full pressure, in the event of any of the electricity works or sub-stations being destroyed or partially destroyed.

A little thought will show that the danger of switching off the light would be far greater than that due to bombs dropped from the aircraft. Without even considering the dangers of street traffic in the dark, two classes of building would be affected in such a way as to cause far more casualties than the bomb-throwing. If theatres were suddenly plunged into darkness, the inevitable panic would ensue, for the emergency lighting of theatres is, as a rule, electric as well as the main lighting, although it is supplied by a different company or through a different main belonging to the same company. Hospitals would be in a terrible plight. There should be no panic there, but there would be loss of life in almost every operating theatre. Some of these have separate supply from two companies to provide for emergencies such as engineering breakdowns, but very few London hospitals have their own generating plant or an emergency accumulator reserve.

Some time ago, we believe, an order was issued, at any rate to some of the electricity works in London, to prepare to

reduce their supply pressure by 50 per cent. in the event of certain instructions being received on the approach of hostile aircraft, but this order was very quickly cancelled.

Another interesting phenomenon would occur if the whole of the electric light works were to switch off. Large quantities of steam would have to be immediately blown off into the atmosphere, and the noise would probably startle the inhabitants of the darkened town far more than the explosion of the dropped bombs. Moreover, the rising steam would offer an admirable target for the Zeppelin; a bomb might be dropped on the Bankside electricity works,—and owing to the difficulty in range-finding, St. Paul's, Blackfriars Bridge, and the Central Telephone Exchange would then all be endangered!

Different conditions, of course, arise in the case of small towns, and doubtless the extinction of the lights in Yarmouth and Cromer last week was the correct policy. In such comparatively small places there can be little risk from cutting off the electricity supply if warning is given to the theatres and hospitals—unless, of course, the anti-aircraft searchlights are connected to the public supply mains.

GUARANTEEING WIRING WORK

THE question of giving a better status to the wiring contracting industry through the medium of a guarantee by the Electrical Contractors' Association, so far, of course, as the work of its members is concerned, has been much discussed for several years. A decision has now been come to by the Council of the Association to adopt a scheme of this character. Some details have still to be settled, but at the last Council meeting the following minute was passed:—

The Council shall have power to appoint an independent engineer to inspect any or all installations either during progress or within six months of completion which may be subject to the Association's guarantee, and each member shall grant every facility for such inspection.

In the event of an allegation being made at the instance of one of the members, the Council shall have power to charge the cost of such inspection to the member making the allegation. Work is, however, to be inspected regardless of the fact as to whether or no a complaint has or has not been made.

The Law and Parliamentary Committee of the Association met yesterday to consider the necessary alteration in the Articles of the Association to give effect to the above. The scheme, full details of which will shortly be available, is intended to come into effect on Oct. 1st next.

THE ILFORD CASE

A briefly summarised in our last issue, the Ilford Urban District Council has agreed with the Ilford Gas Co. that the hiring of lamps and motors, the fitting of consumers' premises, and carrying on showrooms is beyond its Parliamentary powers, and also that certain tariffs, giving advantages to persons whose premises are lighted by electricity only, constitute preferential charging, and come within the Long Eaton judgment.

When the matter came before Mr. Justice Sargent on Wednesday last week, however, it was evident that the Gas Company, not content with having gained its main points, viz., a declaration that all the above were illegal, intended to push the advantage so gained to the furthest possible limits. Mr. Martelli, K.C., for the Council, referred to the Company's attitude as an example of "ruthlessness in warfare." In the first place, the Council has some thousands of pounds' worth of motors, arc lamps, and wiring on hire agreements varying from one to five years, and naturally now desires to dispose of them on the best possible terms. A period of twelve months was asked in which to do this, and during this period the Gas Co. was not to be entitled to apply for an injunction. The Gas Co., however, would only agree to three months, and furthermore claimed that under the declaration agreed to by the Council the apparatus in question could not be sold to the present hirers, nor, indeed, at all.

Meanwhile, the Gas Co. has appeared at the annual audit of the Council's accounts, and claims a surcharge of the whole sum expended in hiring and fitting, and there seems no doubt that the Local Government Board auditor will have no alternative but to recommend this surcharge, although, of course, it is within the powers of the Local Government Board to remit it subsequently. Thus, if the Council are advised that under the declaration it cannot sell the apparatus, and the surcharge is duly made, the only course to be followed is for the apparatus to be handed over to the surcharged councillors, who themselves must sell it and set off the amount so received against the surcharge.

Mr. Justice Sargent eventually granted the declaration

agreed between the parties, with liberty to the Gas Co. to apply for an injunction without any restriction as to period. He pointed out, however, that the Council must have a reasonable time within which to dispose of the apparatus in some form, and hinted that he would not grant the Gas Co. an injunction to restrain the Council selling the apparatus should the Gas Co. see fit to apply for one.

The moral to be drawn from the result of this case is that municipal electricity undertakings, desiring to hire out motors, &c., and not having the power to do so, must proceed as many are already doing (see ELECTRICAL ENGINEERING, Jan. 7th, p. 3), and obtain these powers by private Bill. In doing so, it is true, they will in some cases meet opposition from the electrical contractors as well as from the gas companies, but they will certainly have a good case—certainly a better one than when they exceed their powers and have to defend their action in the law courts. As to the tariff question, we have always maintained that it is a mistake to have a number of different tariffs, some of them most complicated. We are convinced that tariffs which are with difficulty understandable by a certain proportion of the consumers—and the reasons for which are understood by hardly any—are a mistake from a purely business point of view, and that as many consumers are lost as gained by them. The rebate to power consumers who have electric lighting, which was condemned in the Long Eaton case, must now be unconditionally abandoned, if indeed it still lingers anywhere, and the only remark to make with regard to this is: Was it ever worth while? The consumer who is already convinced as to the advantages of electric power should, as a rule, need but little convincing as to the advantages of electric lighting; if there are any with such tenacity of opinion that they cannot be convinced by reason, it is unlikely that they will submit to coercion. With the metal filament lamp firmly established as a more economical form of lighting than the gas burner, and with the half-watt lamp making rapid progress, managers of electricity works can afford to give less time and thought to the framing of tariffs asymptotic to the border line which divides preferential charging from allowable tariffs.

SEARCHLIGHTS

AT the meeting of the Illuminating Engineering Society on Jan. 19th, a discussion on searchlights was opened by Mr. P. G. Ledger. The chief essential in a searchlight, he said, was a source of great intrinsic brilliancy and small dimensions. Strictly a "point-source" would be necessary to get an absolutely parallel beam, but in practice there were few instances in which a beam of smaller divergence than 2 to 8 degrees was desirable.

For large searchlights the electric arc was invariably used, and gave an intrinsic brilliancy of about 200,000 c.p. per sq. in. In the modern searchlight the beam was obtained merely by placing the arc at the focus of a parabolic mirror. Dispensing prismatic lenses were often provided in front to spread the beam over a wider angle and enable a considerable area to be inspected at close quarters. In the earlier searchlights inclined carbons were used, and this method was still followed in small projectors. Nowadays the carbons are arranged horizontally, the positive carbon carrying the crater facing the mirror. The negative carbon is made as small as possible so as to obstruct a minimum of light, and various devices are used to increase its conductivity (such as coating the exterior with copper and introducing a copper wire into the carbon).

Mr. Ledger reviewed the historical development of the searchlight, which was first used in the French Navy in 1867, and touched on the work of Fresnel and Mangin. The former replaced the early metal mirrors by silver glass, and Mangin ground the two surfaces of the glass to different curvatures to obtain a nearer approximation to the effect of a parabola. There was, however, now no difficulty in grinding parabolic surfaces of considerable accuracy. A recent improvement had been the introduction of the iris shutter, by which the light could be instantly shut off without interfering with the steadiness of the arc. There were difficulties in rating searchlights in candle-power, as with a concentration beam the light behaved as if coming from a source far behind the mirror at the virtual centre, and with a true parallel beam it was obviously impossible. A 150-ampere projector with a 150-cm. mirror gave a mean horizontal intensity towards the mirror of about 46,000 c.p., and the c.p. of the beam could reach as much as 180,000,000. For the reasons explained, however, it was not usual to specify candle-power. The range of a searchlight was almost

as vague, depending largely on atmospheric conditions; in average circumstances a 150-amp. projector would reveal objects up to 10,000 yards. The range was stated to be proportional to the square root of the diameter of the mirror and the fourth root of the intrinsic brilliancy of the source. It was now necessary, on account of aircraft, to use searchlights at all angles, and even to throw a beam vertically upwards. This introduced some difficulties owing to the danger of particles of hot carbon falling on the mirror. It could be got over by using a lens instead of a mirror or using a further deflecting mirror. It had been suggested to alter the colour of the beam in the red direction of the spectrum to obtain better penetration in fog, but Mr. Ledger was not aware of the extent to which this is done.

Improvements in the manufacture of carbons had been introduced from time to time, but without some radical change in principle it hardly seemed possible to increase very materially the light from an ordinary searchlight except possibly by increasing the brilliancy of the crater.

The steadiness of the arc had been improved by the small diameter of the negative carbon, made possible by the use of a copper core. For a 100-amp. arc the negative would be about 13 millimetres in diameter, and the positive about 27 millimetres, so that the shadow cast by the former—especially with the relatively long arc used in modern searchlights—was inconsiderable. Another device that assisted in steadyng the arc was the use of a horseshoe of soft iron, converted into a magnet by the field of the current flowing through the electrodes to blow the arc downwards. Some of the most important recent improvements had been in the design of remote control apparatus. An officer could now carry out observations through a telescope, so connected with the projector that the latter followed continuously and instantly all the movements of the telescope.

In the discussion, Mr. Justus Eck spoke of an improved design of searchlight recently developed in America. The carbons in this were inclined at a special angle. They were of very small diameter and were continuously rotated, while the points were bathed in methylated spirit vapour. By this means a more concentrated point of illumination of higher specific intensity was obtained, and the crater was concentrated at the end of the carbons. Mr. W. M. Mordey questioned whether a return might not be made to an alternating-current lamp with carbons placed at such an angle to each other that both craters were visible. He believed that in the ordinary lamp the negative carbon screened off some 20 per cent. of the light. With regard to altering the colour of the light, he suggested that this could be done by using chemically impregnated carbons instead of sacrificing some of the existing rays. Mr. Lyon agreed as to the vagueness of candle-power statements and proposed standard conditions of a 10 ft. square screen at 1,000 yards for rating purposes. He referred to portable searchlight plants and an aeroplane outfit supplied by a variable speed dynamo driven by the main engine. Mr. T. Ritchie called upon the society to standardise the ratings of searchlights, and also spoke of the vapour-cooled electrode, which would give an increase in efficiency of 10 to 20 candles per watt and altered the colour of the light in the required direction, giving, in the opinion of the U.S. Naval authorities, greater penetrative power and less glare, so that the observer could be nearer the projector. Mr. F. W. Willcox gave some information as to the use of half-watt lamps in small searchlights, and another speaker said that the French Government used much overrun incandescent lamps in their small searchlights. A report of some American investigations was referred to by Mr. H. Smith; and Mr. Chalmers, speaking of the definition of range, said that it was entirely a question of the size of the object to be picked up. It was of great importance to have as divergent a beam as was consistent with adequate brilliancy, as one was liable with a very narrow beam to miss an object when passed over quickly by a narrow beam. Mrs. Ayrton spoke at some length on the stability of the arc, emphasising the necessity for sufficient voltage of the supply to allow of an adequate series steadyng resistance. There should be something like 50 volts extra to play with. There was a good deal in the handling of the lamps, as well as the correct relation of current voltage, length of arc and size of carbons. Finally, Mr. A. P. Trotter, who was in the chair, made a few remarks, dwelling on the importance of practical details of handling which concerned more than did the theory. What the man who had to use a searchlight had to know was how to strike the arc without jamming the carbons and blowing the fuse; how to lengthen it without putting it out and without making mushrooms, and how to clear them when they did occur; how to fix and change carbons without burning his fingers, and how to work without hurting his eyes. Reference had been made to the C.P. of a searchlight, but he was strongly of the opinion that there was no such thing as the C.P. of a searchlight. He had been hesitating over the use of lumens in photometry, but here he did think that the only way to talk about the practical result of a searchlight was in lumens or flux of light. Mr. Ledger made a few observations in reply.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS. A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

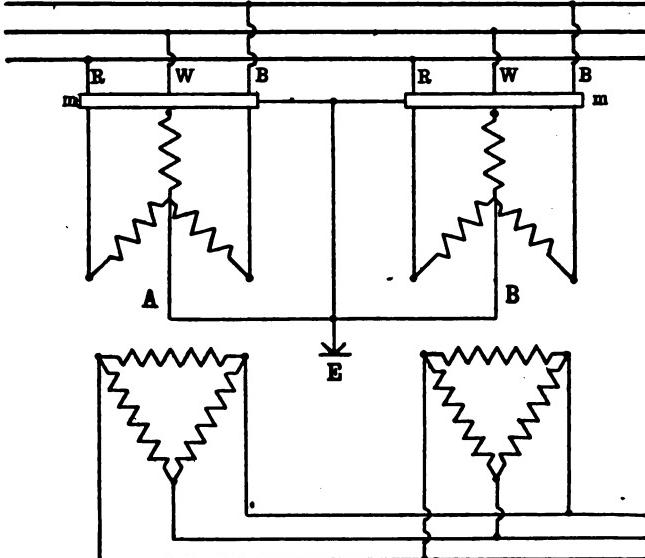

QUESTION No. 1,427.

A shunt-wound commutating pole generator, driven by an induction motor, shirks the load when run in parallel with other identical machines, yet deals satisfactorily with the load when run alone. What is the probable cause of this?—SPARK GAP.

(Answers must be received not later than first post Thursday, Feb. 4th.)

ANSWERS TO No. 1,425.

A number of three-phase, 25-cycle induction motors are connected to three bus-bars supplied from two 200 k.v.a. transformers at 400 volts between phases. Each transformer is provided with a four-wire watt-hour meter, the two potential coils in each case being connected between two of the phase wires,

A.B. TRANSFORMERS. M.M. WATT-HOUR METERS.

and the neutral point of the system, which is earthed. It was desired to check the relative loading of the transformers by simultaneous readings. The only instruments available were two indicating watt-meters, and these were inserted in turn in the phase wires, as shown in the figure. The results obtained were as follows:—

| Trans. former. | Current Coil in Phase. | Potential Coil between Phases. | Watt-meter between Neutral | | Watt-meter Reading. |
|-------------------|------------------------------|--------------------------------------|----------------------------|------------|------------------------|
| | | | Watt-meter Reading. | and Phase. | |
| A | R | R-W | 140 | R | 25 |
| B | R | R-W | 55 | R | 80 |
| A | W | W-R | 180 | W | 80 |
| B | W | W-R | 185 | W | 90 |
| A | B | B-W | 130 | B | 110 |
| B | B | B-W | 200 | B | 85 |

It should be noted that while each pair of readings was taken

simultaneously, the observations of one phase are not comparable with those of another as the load may have altered meanwhile. What is the explanation of the wide variation in the relative values of the simultaneous indications which were obtained?—J. E. F.

The first award (10s.) is given to "OHM," whose reply is given in abbreviated form below:—

It is difficult to imagine what the particular object was of the tests described, for as the three sets of readings were taken at different times, they simply prove that both the load and power factor of each transformer are rapidly changing. Furthermore, in changing the wattmeter from one phase to the other, the potential connections were not made in the proper order. The correct procedure would have been to connect the potential circuit between phases R-W, W-B, and finally B-R, corresponding to the three sets of readings taken on the phases in the order R-W-B. The tests made by connecting the potential circuits between phases and neutral are of value, for assuming that the phases are balanced, the input to each transformer is exactly three times the reading of the wattmeter. It is clear, therefore, that the load on transformer A was very erratic. Presumably the wattmeter reading should be multiplied by a constant to give the true reading in kw., otherwise each transformer is very heavily overloaded. Comparing the readings in the last column of the table, and comparing the three pairs of simultaneous readings, we obtain a comparison between the loads on the two transformers at three distinct periods.

The other readings are of practically no value, although if the two wattmeters had been connected to the same transformer and simultaneous readings of this nature taken, the power factor could have been deduced. Assuming that the phase rotation for the circuit is in the order R-W-B, then the wattmeter with potential coil connected between phases, actually measures $CV \cos(30^\circ + \theta)$ for the current coil in phase R, and $CV \cos(30^\circ - \theta)$ for the other two phases, where C=phase current, V=phase voltage (between phases), θ =phase displacement of current. With the potential connected to the neutral, the wattmeter will in each case measure $CV \cos \theta / \sqrt{3}$.

If J. E. F. wishes to determine accurately the true load conditions of the two transformers it will be necessary for him to connect two single-phase wattmeters to each transformer (in accordance with the well-known two-wattmeter method), and an ammeter in each phase. Simultaneous readings of the ten instruments should then be taken, from which the true kw. load, power factor, and balancing of the phases can be determined for each transformer at the same time, so that a comparison of each of these factors can be made.

The second award is made to J. E. R. R. for the following reply:—

The reason for the varied results obtained is, as suggested in the question, that the power in the line is rapidly varying between the times the several readings were taken. The readings themselves prove this to be the case. The readings in the last column were obtained by a current coil in one phase and a pressure coil between that phase and the neutral point. Now a wattmeter so connected would read, to a high degree of accuracy, one-third of the total power flowing in that circuit,

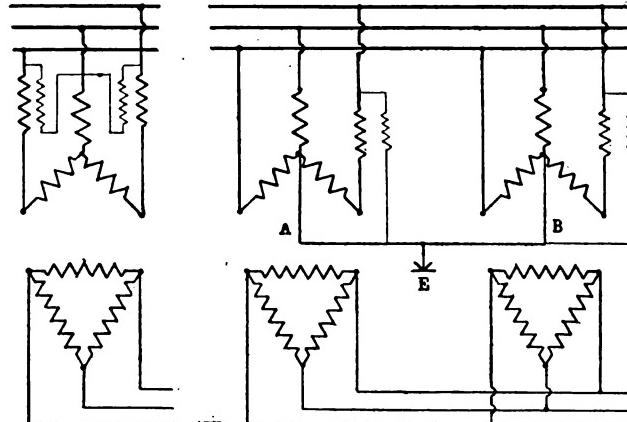

FIG. 1.

providing the phases are balanced. Take the readings for transformer A. There can be no doubt that when the readings 25, 80, and 110 in the end column were obtained, the total power given out by this transformer was 75, 240, and 330 respectively. Similarly for transformer B, when the readings 80, 90, and 85 were taken the power given out was 240, 270, and 255 respectively. So that the power given out by each transformer varies considerably.

The most accurate of all methods of wattmeter connection for measuring the power in a three-phase circuit, balanced or unbalanced, is what is termed the two-wattmeter method, as

shown in Fig. 1. Now according to this method the total power of transformer A should be given by the addition of the readings of line 1, column 4, and line 5, column 4, i.e., 140+130=270, but the closeness of these readings suggest that they are not right. From their ratio we can get the P.F., and for a ratio of $\frac{130}{140} = .928$ the P.F. would be almost unity, which is out of the question for an induction motor load.

Unless special short-circuiting switches are arranged it takes a good deal of time to change the current coil out of one phase into another, even if current transformers are used, and if the load is varying all the time no comparison can be made between one reading and another. The readings given, for this reason, are very unreliable.

Undoubtedly the best method of utilising these two indicating wattmeters to get comparative simultaneous readings of the load of each transformer is to connect them, one in each transformer, as shown in Fig. 2. Each meter will then indicate the power delivered by one phase of the transformer in which it is connected, and therefore one-third of the total power delivered by that transformer to the load. By observing the readings

of these two meters simultaneously over all ranges of load the proper relative loading of each transformer can be accurately obtained.

ANSWER TO CORRESPONDENT

STUART HODGSON.—The address of the secretary of the Institution of Electrical Engineers is Victoria Embankment, London, W.C.

 **BINDING "ELECTRICAL ENGINEERING."** — Vol. X. of "Electrical Engineering" (Jan.—Dec. 1914) closed with our issue of December 31st. Readers can have their volumes bound by their own bookbinder; or, they may send their numbers to THE KILOWATT PUBLISHING Co., Ltd., Temple Chambers, London, E.C., carriage paid (with the reader's name and address), and a remittance of 4s. 6d. under separate cover. The volumes will then be bound and returned carriage paid to any address in the United Kingdom, or carriage forward to the Colonies or abroad. Binding Cases (including index, but not including binding) 2s. each, or post free 2s. 4d. (Abroad 2s. 6d.) Index alone, 1d. (Post free 2d.).

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Jan. 21st, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

29,712/13. **Wireless Telegraphy.** R. C. GALLETTI and GALLETTI'S WIRELESS TELEGRAPH & TELEPHONE CO. A transmitting device capable of dealing with high voltages and currents employing a large resistance and key in shunt with part of a series discharger, and effecting signals by controlling the spark distance of the discharger. (Four figures.)

29,752/13. **Train Control.** B.T.-H. Co. (G.E. Co., U.S.A.). A system of electric train control with regenerative braking in which auxiliary excitation, obtained from a motor-generator on the train, is superimposed on the series field and automatically varied by a regulator of the Tirril or other type, which acts on the field of the auxiliary generator and keeps the value of the regulated current constant. (Two figures.)

5,050/14. **Arc Lamps.** F. W. STURGEON. Arc lamps for searchlights in which, in addition to a refractory fixed stop which prevents the upper carbon descending below a certain point and fixes the position of the arc, there is provided a refractor pivotally mounted abutment, or damper, a little higher, pressed against the carbon by a spring to prevent uneven turning of the carbon and irregular feed. (Three figures.)

10,948/14. **Electric Traction.** C. M. WHITE (M. E. Sturges, New York). A tangential system of traction in which a continuous developed slotted core, with conductors in the slots laid on track, acts as the rotor of an induction motor, and a similar short core on the train carries winding supplied with polyphase current and acts like the stator. By this arrangement the losses are much less than in the reverse arrangement with current supplied to the track and induced in the train winding. (Two figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

SUMMARIES OF SOME OF THE MORE IMPORTANT OF THESE PATENTS WILL APPEAR IN OUR NEXT ISSUE.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: B.T.-H. (G.E. Co., U.S.A.) [Protective system] 4,133/14.

DYNAMOS, MOTORS, AND TRANSFORMERS: WADE (Mason) [Dynamos] 967/14; RADLEY [Motor control] 1,975/14; JEAL [Regulator for dynamos] 10,505/14.

Heating and Cooking: WILDE [Heating] 15,879/13; PERRY [Baking] 22,359/13.

Ignition: COLE [Sparkling plugs] 27,114/13; ROBERTS [Sparkling plugs] 12,005/14; ROXCE and ROLLS-ROYCE, LTD. [Ignition control] 17,267/14; MASON [Magnetics] 21,966/14.

Instruments and Meters: GRIESBACH and VENNER TIME SWITCHES, LTD. [Prepayment mechanism] 1,363/14.

Switchgear, Fuses, and Fittings: HOPE [Fuses] 22,575/13 and 24,274/13; CHRISTENSEN and WETTERGREEN [Multiple fuse] 518/14; MARKS (Benjamin Electric Mf. Co., U.S.A.) [Switch holders] 2,388/14.

Telephony and Telegraphy: BALSILLIE [Wireless transmitter]

22,537/13; WESTERN ELECTRIC CO. (Woodward for W.E. Co., U.S.A.) [Automatic telephones] 561/14; JEFFERIES [Antennæ] 11,120/14.

Traction: MORRISON [Electromagnetic power transmission for automobiles] 27,617/13; VON KANDO [Trolley-wire supports] 749/14.

Miscellaneous: SHEPARD AND McKECHNIE [Flashlight signalling] 28,834/13; SCOTT [Steering gear] 73/14; WILSON [Enhancing permeability of magnetic material] 194/14; PEMBERTON [Fire alarms] 9,594/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

DYNAMOS, MOTORS, &c.: LA COUR [Converters] 103/15.

INCANDESCENT LAMPS: RAMY, 23,481/14.

TELEGRAPHY: GOLDSCHMIDT [Wireless selector] 14,595/14.

TRACTION: SOC. ANON. DES ETABLISSEMENTS L. BLERIOT [Car lighting] 24,629/14.

MISCELLANEOUS: TSCHUDY [Electro-mechanical thread breakage detector for spinning machines] 24,342/14.

Opposition to Grant of Patents

24,755/13. **Insulators.** F. HANDCOCK. An appeal has been lodged against the Comptroller's decision to allow the grant of a patent on this application, in spite of opposition. The specification describes a tool for boring holes in porcelain insulators during manufacture.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:

2,116/01. **Graphite Manufacture.** O. IMRAY (International Acheson Graphite Co., U.S.A.). A process of manufacturing graphite in which the electric furnace is charged with discrete carbon in the form of lumps embedded in powder along with a carbide forming material. The whole is raised to a temperature sufficient to vapourise the latter material and convert the carbon into graphite.

The following are the more important Patents that have become void through non-payment of renewal fees.

ARC LAMPS: GEB. SIEMENS & CO. [Flame arc carbons] 21,374/09.

DYNAMOS, MOTORS AND TRANSFORMERS: R. BRAUN [Three-phase equaliser system for winding plant] 20,169/05; J. S. PECK [Three-phase load equaliser regulation] 20,895/08; SIEMENS BROS' DYNAMO WORKS, LTD. [Cooling of dynamos] 22,789/09.

IGNITION: F. MÜNZ [Magnets] 22,323/06.

INCANDESCENT LAMPS: WOLFRAM LAMPEN A.G. [Decarbonising metal filaments] 10,891/08.

INSTRUMENTS AND METERS: ABON ELEKTRICITÄTSZÄHLERFABRIK [Meters] 28,271/08.

STORAGE BATTERIES: J. E. O. MÉRAN [Secondary batteries] 21,363/03; E. SOKAL, S. BLOOMFIELD and C. WOLFF [Secondary batteries with forced circulation] 22,000/06.

TELEPHONY AND TELEGRAPHY: G. R. WEBB [Telephones] 22,580/09; A. BURNS [Productions of continuous oscillations] 22,640/09.

TRACTION: H. LEITNER [Brush carrier for train lighting dynamos] 23,042/09; E. WEISSE [Electric vehicles] 23,069/09.

MISCELLANEOUS: H. W. HEADLAND [Fire alarms] 22,617/09.

ELECTRIC TRACTION NOTES

According to the *Electrical World* (New York), the following is the official report issued by the Interborough Rapid Transit Co. of the accident which occurred on Wednesday, Jan. 6th, on the New York Subway, and was reported in ELECTRICAL ENGINEERING, Jan. 14th, p. 17:—"About 8.10 o'clock this morning a short circuit was established on the cables in the man-holes at Fifty-third Street. These man-holes are on either side of the subway, and the cables in them come from the sub-station in Fifty-third Street, east of Eighth Avenue. An examination of two man-holes shows that practically all the cables have been short-circuited and destroyed. These short circuits made a tremendous arc, and created considerable gases and smoke from the burning insulation and the molten metal. The short circuits automatically tripped circuit-breakers in the sub-station, which cut off the power. This automatically took the power away from the third rail and the trains stopped." It appears that the burn-outs occurred in compartments opening into the tunnel, which was filled with smoke, and that this, combined with the panic, was responsible for the injuries to passengers. The account in the *Electrical Railings Journal* states that many of the passengers were rescued through a street man-hole by firemen, but that the latter were not called till one hour and fifteen minutes after the first short circuit occurred. It is further reported that power at reduced voltage was supplied to outlying sections of the line for about half an hour after the first short circuit, and then all power went off. This indicates the gradual progress of the fire in the cable man-holes, the latter communicating with the subway tube by means of steel doors which were insufficient to keep the smoke from the burning insulation out of the subway. The final cutting-off of all power put out the emergency lights that are mounted on the subway walls, although these are supplied from a circuit separate from that supplying propulsion current. All of the cars in the subway are equipped with emergency storage-battery lights, which assisted the egress of passengers.

The Highways Committee of the L.C.C. recommends an expenditure of £6,850 upon the provision of cables in connection with a new arrangement with the London Electric Supply Corporation, by which the latter will give a further

supply of energy to the Council up to 3,500 kw. at £8 per kw. per annum plus 0·4d. per unit. This arrangement is to remain in force for at least six months, but the Council has the option of extending it for a further six months. If after the expiration of the first six months the Council merely requires the supply for stand-by purposes, the charge will be at the rate of £2 per kw. per annum. The cable ducts will be laid by the Company.

The Glasgow Corporation is extending the use of electrically-driven vehicles for departmental purposes. The Cleansing Department has seven, and an additional six are on order.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The large variety of types of private branch exchange boards is apparently to give way gradually to a more uniform system. The *Post Office Electrical Engineers' Journal* describes three standard types of boards which are to be used for future work. Speaking keys, or their equivalent, are now to be universal, and boards serving not more than twenty extensions are to have an audible alarm on the supervisory signals. Cordless boards will be used up to a total of ten lines in all (thus three exchange lines and seven extensions), and in these the extension line signal is controlled by a series relay and acts as a supervisory signal with an audible alarm, which is thus in line with the keys on which the connection is established. Plugging through is to be possible on all boards, and the right connections are provided by special keys, which, when thrown, render the supervisory signals inoperative. The substitution of the relay with a non-inductive winding for the series "eye-ball" signal will provide improved transmission and signalling conditions. A disadvantage of the arrangement of this board is that the extension cannot call in the P.B.X. operator to transfer an incoming call without giving a false supervisory signal at the main exchange, as the clear is simultaneous on both the main and branch exchanges. Larger boards will be double-cord boards arranged so that the extension station controls only the supervisory signal at the P.B.X. and the exchange line is held until the latter clears.

"ELECTRICAL ENGINEERING" TRADE SECTION

CATALOGUES, PAMPHLETS, &c., RECEIVED

CONTINUITY CONDUIT FITTINGS.—A new list from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.) describes conduit fittings with the "Demon-grip" device which in its present form obtains the necessary electrical continuity by means of a cheese-headed screw. The relative positions of the screw and tube are such that whilst the thread of the screw is just clear of the tube, the head is forced against the tube when the screw is tightened down, the screw-hole in the lug being specially counter-sunk to allow of this. The sharp bottom edge of the screw head cuts through the enamel and ensures certain continuity even should the enamel not be removed from the end of the tube. In addition the screw acts similarly to a cotter-pin, keying the tube securely into the fitting.

SWITCHGEAR.—An illustrated pamphlet from the British Thomson-Houston Co., Ltd. (Rugby), describes the various forms of switchboard panels for three-phase systems up to 6,600, which they have standardised, including flat back and cellular arrangements of several patterns. A good deal of information is given as to the circumstances in which each pattern has special advantages, and as to the equipment with which it is provided. Another leaflet gives particulars of a magnetic blow-out form of lighting arrester, suitable for continuous-current circuits.

IRONCLAD SERVICE FUSE BOXES.—A new illustrated catalogue of ironclad service fuse boxes is being issued by W. T. Henley's Telegraph Works Co., Ltd. (Blomfield Street, E.C.). A considerable variety of patterns of both open and bridge type fuse boxes are listed, the latter all complying with

the Home Office requirements. A stock of all the patterns listed is kept at the company's various branches. Attention may be drawn to the method of packing employed. The separate boxes are packed in corrugated cardboard cases of a form which can very easily be stacked and given out in perfect condition when required. The types listed are by no means all made by the firm, and new designs are being introduced at a rate which it is impossible for any catalogue to keep pace with.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

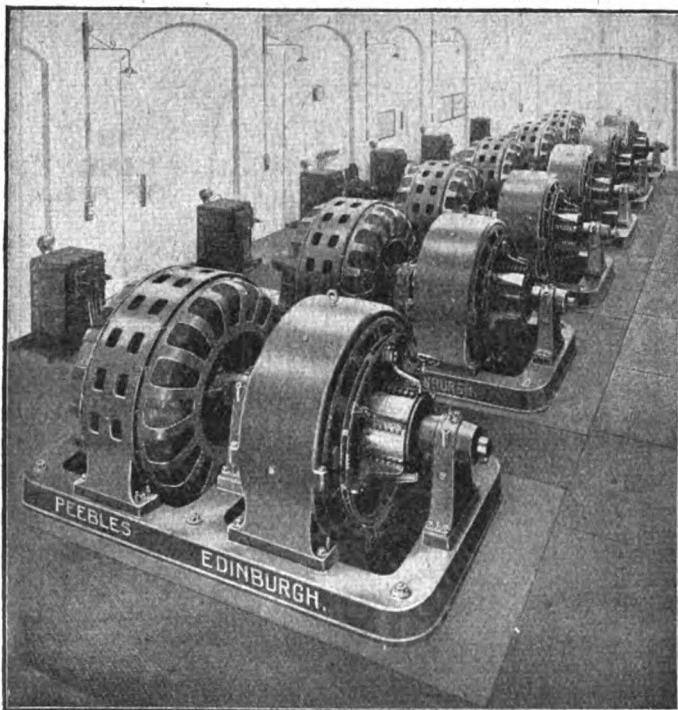

PORTABLE INSTRUMENTS.—A leaflet from Crompton & Co., Ltd. (Chelmsford), describes a portable pattern of continuous-current moving coil instrument made in various ranges up to 600 amperes as an ammeter, and up to 600 volts as a voltmeter. Combined ammeters and voltmeters and multi-range instruments of the same class are also included.

BELLS AND ACCESSORIES.—A list from Julius Sax & Co., Ltd. (24A High Street, New Oxford Street, W.C.), deals very fully with electric bells, buzzers, indicators, pushes, &c., as well as electric light accessories, such as lamp-holders, adaptors, plugs, fuses, ceiling roses, holophane reflectors, and special fittings for this form of glassware.

Ediswan Staff Concert.—A very successful smoking concert was held at their staff café on Friday last by the staff and foremen of the Edison & Swan United Electric Light Co., Ltd. (Ponder's End). Particular mention may be made of the excellent singing of Mr. C. F. Warren and the humorous contributions to the programme by "Little Jack," who is the much worried though exceedingly courteous telephone exchange operator at the works.

PEEBLES MOTOR CONVERTERS

A NEW pamphlet from Bruce Peebles & Co., Ltd. (Edinburgh), gives interesting information as to the Peebles-Les Cour motor-converter, which is now well known and largely in use throughout the world. An effective view of a sub-station of the Calcutta Electric Supply Corporation equipped with these sets is shown below, which reproduces one of the striking series of illustrations in the

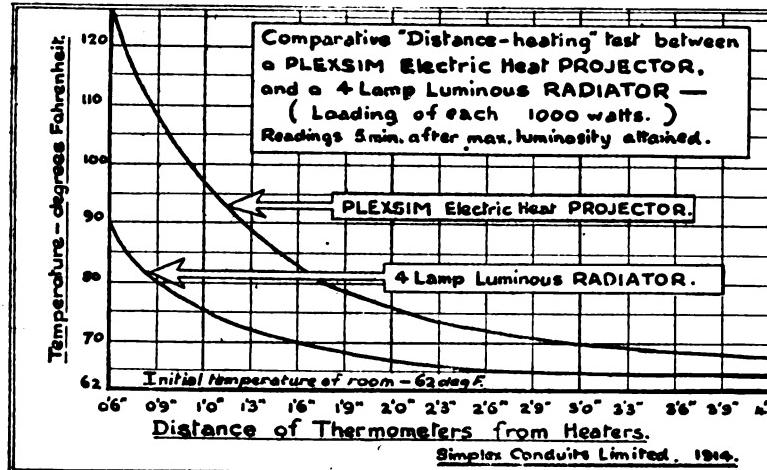

GROUP OF MOTOR-CONVERTERS AT SUBSTATION OF CALCUTTA ELECTRIC SUPPLY CORPORATION.

pamphlet. The principles of the motor-converter are clearly set forth, and the advantages of this class of plant over rotary converters and motor-generators are discussed. It scores particularly in the matter of efficiency and power-factor, and is simpler to handle as regards starting, synchronising, and regulation. Its uses on traction and lighting systems are explained, and its possibilities as a three-wire balancer are pointed out.

ELECTRIC HEATERS

A VERY complete range of electric heaters of numerous different patterns is contained in a new illustrated list just issued by Simplex Conduits, Ltd. (116 Charing Cross

Road, W.C.). The radiators are produced in designs to suit all circumstances, and vary in price from 16s. for a simple single lamp heater to £7 for six-lamp radiators of artistic design. A special feature of these is the arrangement of the wiring, which is carried to screwed terminals in the base, allowing of the radiator being quickly connected up. A large

number of convectors are also listed, and these are all made on the well-known Simplex strip system. The elements employed are very similar in construction to those used in the Company's kettles and other cooking appliances, and consist of non-oxidisable resistance ribbon wound on mica plates, the whole enclosed in a steel frame. A number of these elements are placed in parallel in the heater. Some new designs of the Plexim heat projector (see ELECTRICAL ENGINEERING, Oct. 22nd, 1914, p. 554) are listed, and an interesting curve reproduced here clearly shows its superiority over the ordinary lamp type in the matter of speed of heating up.

A USEFUL ADAPTOR FOR HEATING APPARATUS

IT is often convenient to connect electric kettles, irons, or other pieces of domestic heating apparatus to an ordinary lamp-socket without interfering with the use of the lamp, so that the heater and lamp can be put on and off independently or used at the same time. The adaptor illustrated here, which is made under Patent No. 27,503/12, has been put on the market by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), to meet these conditions. As will be seen, it fits in an ordinary lamp-holder, and provides for a lamp in a line with its original position, while the holder into which the adaptor plug connected to the heating circuit is at the side at such an angle as not to interfere with a shade being used on the lamp with the ordinary shade ring as shown. A simple and well-made switch in the body of the adaptor turns the light on and off, and the heater is controlled by inserting and withdrawing its plug. The construction of the apparatus is very ingenious. The body is split in a vertical plane, and these two halves, made of insulating material, form at the same time the lamp-holder insulator and completely enclose all live parts except the top adaptor contacts and the lamp-holder plungers. The device should have a considerable field of usefulness.

SWITCH ADAPTOR FOR LAMP AND HEATER.

WE illustrate here a pattern of fitting for half-watt lamps made at the Ponders End works of the Edison

CAST-IRON FITTING FOR HALF-WATT LAMPS.

& Swan United Electric Light Co., Ltd., and put on the market at a very moderate figure. The fitting is made of

high grade cast-iron finished in brilliant black enamel, and is suitable for interior or exterior use. Two sizes are made, one for 100-watt to 300-watt lamps, and the other for lamps up to 1,000 watts. A simple form of adjustment of the lamp position is provided, and a special English opalescent globe is employed. A similar fitting is also made which is surrounded by an 18-inch reflector.

THE B.E.A.M.A. JOURNAL

THE British Electrical and Allied Manufacturers' Association has issued the first number of a finely-printed quarterly journal. We understand that its main object is to introduce the Association and its members—or, at any rate, the firms who have advertised in it—in the Colonies and abroad, and that a few thousand copies have been sent out to a carefully-compiled list of recipients. It is not intended that the journal shall be a burden on the Association, but it is to be self-supporting by means of the revenue derived from the advertisements it contains. A feature is a classified list of manufacturers in four languages, English, French, Spanish, and Russian, of the names of those firms who have contributed to the support of the publication. A full list of the firms belonging to the Association is not included. Useful international tables of weights, measures, and money are included, and introductory notices, not only in the four languages mentioned, but also in Italian, Japanese, and Chinese. The journal contains some excellent articles, a few of a technical character, and several pages of trade announcements of an advertising nature.

CORRESPONDENCE

REDUCED STREET LIGHTING.

To the Editor of "ELECTRICAL ENGINEERING."

SIR.—I have read with interest the remarks regarding the Wardle Engineering Co.'s lantern in your current issue, in which reference is made to my design of reflector, which you kindly described in your issue of the 1st inst. The Wardle Engineering Co., and possibly others of your readers, seem to have misunderstood the object of this reflector. It has not been introduced as an example of the best type of fitting it is possible to employ for street lighting purposes, but merely as an expediency to meet the present circumstances, and, as pointed out in your article, is intended to be adapted at a cost of a few shillings to any existing lamp, either gas or electric, in preference to the present inefficient method of painting the globes. The point raised by your correspondents that to obtain an even illumination it is very important to get the maximum candle power very near to the horizontal is quite true, but it should be borne in mind that as the angle of maximum intensity is raised the value of the candle power must be increased enormously if any illumination is to be obtained at that angle worth having. For example, whilst the lantern described by the Wardle Engineering Co. gives its maximum candle power at 17° below the horizontal, the horizontal illumination given by this ray is only 5 per cent. of the maximum illumination occurring beneath the lamp, or, in other words, in order for this lantern to give a uniform illumination over the 80-ft. radius referred to, its maximum candle power would have to be twenty times that shown by the polar curve. In the "Beuttell" reflector the corresponding ratio of the illumination given by the maximum ray to that beneath the lamp is 50 per cent., the resulting illumination given by two such reflectors being therefore approximately uniform with the illumination below the lamp.

109 Victoria Street, S.W. Yours faithfully,
Jan. 23rd, 1915. ALFRED W. BEUTTELL.

[It may be suggested that the principal requirement is really that there should be no possibility of reflection from the white surfaces of buildings, &c., and that therefore the maximum degree allowed should simply depend on the width of the street. The ideal would appear to be an adjustable reflector.—*Ed.*, E.E.]

Fire Extinguishers.—The Pyrene Co., Ltd. (19/21 Great Queen Street, W.C.) have made some improvements in their well-known fire extinguisher (see ELECTRICAL ENGINEERING, May 21st, 1914, p. 287, which is now made with a hexagon head that can be tightened with an ordinary spanner. In speaking of its special applicability to electrical purposes they point out that the liquid employed has extinguished 220 volt, 2,000 ampere arcs, and that a jet has been played on 110,000 volt transmission lines without any effect on the operator holding the apparatus.

Ball Bearings.—The Engineering Standards Committee has issued an Interim Report on British Standard Sizes of single row ball journal bearings for automobiles. A complete report giving tolerances, &c., will be issued later, but at the request of the Society of Motor Manufacturers and Traders the sizes settled are published now.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Australia.—Twenty-two miles of paper-insulated lead-covered cable. Deputy Postmaster-General, Melbourne. Further particulars at 72 Victoria Street, S.W. Feb. 9th. This information is only of use to firms who can instruct agents by cable.

Barnet.—The Guardians have rejected an offer by the North Metropolitan Electric Power Supply Co., in favour of installing their own generating plant.

Barnsley.—A loan of £4,800 is to be taken up for electrical extensions.

Bristol.—Twelve months' supply of carbons, meters, arc lamp globes, joint junction and fuse boxes, &c. City Electrical Engineer. Feb. 11th. (See advertisement on another page.)

Cleethorpes.—Loans for the following are to be applied for:—Mains, £7,870; services, £965; cut-outs, £148; switchboard, £198; and meters, £819.

Grimsby.—A new battery is to be installed at an estimated cost of £5,000.

London: Islington.—An expenditure of £55,393 has been sanctioned upon electrical extensions. These include four water-tube boilers and H.T. trunk mains.

St. Pancras.—Arc lamp carbons. Borough Electrical Engineer. Feb. 15th. (See advertisement on another page.)

Rochdale.—Sub-station switchboard. Borough Electrical Engineer.

South Africa.—The Durban Corporation proposes to expend £350,000 upon developing the electric lighting, tramway, and telephone systems.

Southend.—Loans of £30,184 for sub-stations at Leigh and Thorpe Bay and £18,000 for cables have been sanctioned.

Wiring

Ayr.—Additions to existing hospital and construction of new one. Borough Surveyor, Town Hall.

Cardiff.—New technical institute, 750 points. City Electrical Engineer.

Manchester.—Home for girls. Electric lighting and bells. Education Offices.

Tyldesley.—Co-operative Society's premises.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Aberdare.—Cinematograph theatre, Market Street. T. W. Griffiths, Victoria Square.

Bury.—Home for girls. Architect, A. Hopkinson.

Chapel-en-le-Frith.—The Board of Guardians contemplates an electric lighting installation.

Hull.—New hospital for Guardians. Clerk, Harley Street.

Sheffield.—Extensions to Lodge Moor Hospital.

Sunderland.—School, Barnes Estate (£40,000).

Tottenham.—School, Philip Lane. Clerk, Education Offices.

Miscellaneous

Beckenham.—Meters, service-boxes, &c. Borough Electrical Engineer.

Birmingham.—Twelve months' supply of electrical stores for the Birmingham, Tame, and Rca Drainage Board. Engineer, Tyburn Street.

Colchester.—Twelve months' supply of lighting fittings for cars, and overhead equipment. Tramway Manager. Feb. 6th.

Leicester.—The Lighting Sub-Committee has unanimously recommended the adoption of electric lighting for the tramway routes, after having carried out experiments with both gas and electricity.

Marylebone Special Constables.—As we have previously announced, the whole of the electricity works staff at Marylebone have been enrolled as special constables, their primary duties being the guarding of the electricity works, although, of course, they are called upon for other duties when required. Last week the whole of the staff were inspected by Col. Reay, the Inspector-General of the Special Constabulary. Mr. A. H. Seabrook, the Borough Electrical Engineer, is a Divisional Superintendent, and the Sub-Inspectors include Mr. H. H. Holmes, the Sales Manager, and Mr. C. H. Smyth, Mains Engineer.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Coventry.—An order has been placed with Messrs. E. Bennis & Co. for a complete coal and ash handling plant.

London: Hackney.—The existing contract with the British Insulated & Helsby Cables, Ltd., for cables and cable-boxes has been extended for three years, with a sliding scale covering market fluctuations in the cost of copper and lead.

L.C.C.—The Stores Committee recommends the acceptance of the Easton Lift Co.'s tender at £445 for an electric lift for the stores premises in Clerkenwell.

APPOINTMENTS AND PERSONAL NOTES

The following changes in the staffs of the Metropolitan District Rly. Co., the London Electric Rly. Co., the City & South London Rly. Co., and the Central London Rly. Co. are announced:—Mr. W. E. Mandelick, in addition to his office as Secretary, is appointed Business Manager; Mr. Z. E. Knapp is appointed Manager for Maintenance and Construction; and Mr. H. E. Blain, late General Manager West Ham Corporation Tramways, is appointed Operating Manager to the above Companies. Mr. W. E. Blake, in addition to his position as Superintendent of the Line to the District Railway, is appointed Superintendent of the Line to the London Electric, City & South London, and Central London Railways, in place of Mr. J. P. Thomas, who has resigned his position with these Companies to become General Superintendent of the London General Omnibus Co., Ltd.

A recommendation by the Brighton Tramways Committee that Mr. W. Marsh, the Tramways Manager, should be granted an honorarium of 50 guineas in recognition of his services in connection with trolley omnibus experiments, has been rejected by the Council, as was also a subsequent recommendation that the honorarium should be paid at the close of the war.

Mr. C. C. Atchison, Borough Electrical Engineer, Rochdale, has been granted leave of absence owing to ill-health.

Mr. Harold Gray, Borough Electrical Engineer, Accrington, has been granted a commission in the Royal Artillery.

Mr. W. J. Leeming, Chief Electrical Engineer to the Buxton U.D.C., has resigned in order to join the Royal Engineers.

Mr. A. Brown, Chief Assistant Electrical Engineer at King's Lynn, has resigned.

Mr. E. S. Carling, late representative of the Electrical Co., Ltd., for the South of England, has joined the Royal Engineers.

An assistant is required in the Meter Department at the Dewar Place Electricity Works, Edinburgh. City Electrical Engineer.

A switchboard attendant is required in the Salford Electricity Department. Borough Electrical Engineer.

A switchboard attendant is required at Kendal. Borough Electrical Engineer.

Switchboard attendants are required by the L.C.C. (See advertisement on another page.)

A car-shed fitter is required in the Swindon Tramways Department. (See an advertisement on another page.)

Improvers are required at the Bedford electricity works. (See advertisement on another page.)

A consulting engineer has been advertised for by the Islington Guardians on the basis of 5 per cent. commission. Clerk, St. John's Road, Upper Holloway.

LOCAL NOTES

Carlisle: *Electricity Charges.*—A recommendation by the Electricity Committee that the kw. charge for current taken during restricted hours should be comparably reduced was the subject of considerable discussion at the last meeting of the Council, especially on the part of the members of the Gas Committee. There is considerable hostility between the Gas and Electricity Committees, and eventually the recommendation was referred back by 18 votes to 15.

Edinburgh: *Municipal Wiring Abandoned.*—The Council has, after all, decided not to proceed with the proposed powers for electric wiring work, &c. This decision was come to by a vote in the Council sitting in Committee, the figures being 20 against and 13 for the clauses.

Gillingham: *Lamps on Hire.*—Owing to the fact that shopkeepers are not allowed to use their outside lamps at present, the Council has decided to reduce the charge for the hire of such lamps to 1s. per quarter, and not to charge meter rents during the period of the war.

London: *Hampstead: Shortage of Coal.*—The Council's coal contractors having notified that they are unable to give any further deliveries owing to the collieries being closed, the Chief Electrical Engineer has been compelled to accept tenders for supplies in lots from 100 to 500 tons from other sources. At one time the stock of coal in hand had diminished to only three days' supply.

Southampton: *Domestic Supply Tariff.*—Last year, as reported in these notes, there was considerable controversy between Mr. H. F. Street, the Borough Electrical Engineer, and the Chairman of the Electricity Committee, as to the commercial soundness of the 0·5d. charge for energy used for domestic purposes other than lighting. Sir John Snell, who was subsequently called in, recommended that it would be better to make the charge on the kw. basis plus a small charge for energy used; but the Electricity Committee, having considered this matter, have now recommended that no alteration be made in the present basis of charging.

Southport: *A Central Stores.*—The Electricity Committee has suggested the formation of a central stores which shall deal with the requirements of all the Corporation Departments. It is suggested that by adopting this plan considerable savings can be effected.

Stafford: *Electricity and Gas Management.*—A suggestion has been made to the Council that the management of the electricity and gas undertakings should be in the hands of separate committees. Information is to be obtained from other towns before coming to a final decision.

Sydney: *Preference to British Goods.*—The Sydney Corporation has adopted a recommendation by the Electric Light Committee, giving a preference of 10s. per cent. to British-made goods and 5s. per cent. to the manufactures of Allies, as against neutrals. The test of whether a company is British is to be that the share register must show that the majority of shareholders are resident in Great Britain or Colonies.

The Electric Vehicle Committee.—At the last meeting it was decided to circularise undertakings with a view to the adoption of the standard charging station sign. The standardisation of lamps for electric vehicles was reported to have been referred to a sub-committee of the Tungsten Lamp Association. The committee recommend the adoption of the sizes of wheel rims for solid tyres standardised by the Engineering Standards Committee at the instance of the Society of Motor Manufacturers and Traders.

The Queen's Engineering Works Magazine.—The January issue of the magazine of the works of W. H. Allen, Son & Co., Bedford, contains a list of 300 men of the office staff and works now serving with the colours. A number of interesting letters from men at the front appear, and there is an obituary notice of Capt. J. Francis Allen, who died of his wounds at Ypres in November last. An illustrated article describes the training of the Bedfordshire Yeomanry, and among the subjects of technical contributions are centrifugal pumps, steam turbines, and the new Hull Docks.

Railways and the War.—We have received a copy of an interesting book, partly consisting of matter reprinted from the *Railway News*, entitled "Records of Railway Interests in the War, Part I., British, August to December, 1914." Illustrated articles give some particulars of the ways in which the railways served their country in arranging for and carrying out transport of troops and in other ways, and statistics of the many railway men now serving with the colours, and detailed descriptions of the splendidly equipped ambulance trains and other special rolling stock, prepared by the various railway companies. The price of this publication is 1s.

SUMMARY

THE greater part of the extension of the "Bakerloo" Railway to Queen's Park, where it will link up with the L. & N.W. Railway, was opened last Sunday. We give some details of the sub-station, escalators, and other equipment (p. 44).

STATISTICS as to the increase in the use of electric power in mines, electrical accidents, &c., are contained in a Home Office report (p. 45).

AN interesting paper contributed to the South Wales Institute of Engineers by Mr. T. G. Watts describes experiments leading to the evolution of a safe system of running bell signalling without risk of ignition of inflammable gas (p. 45).

A PAPER by Mr. T. D. Robertson, read at the Manchester Section of the Institution of Electrical Engineers, described the principal types of electric furnace used for steel making, and, in particular, the "Electrometals" furnace (p. 46).

THREE patterns of electric miners' lamps have been approved by the American Bureau of Mines (p. 46).

A PAPER by Mr. Ll. Foster, before the Association of Mining Electrical Engineers, reviews some of the principal matters that require attention to prevent breakdowns of colliery electrical plant (p. 47).

ILLUSTRATED articles describe electrical rolling mill and ventilation equipments (pp. 47 and 48).

A REPORT has been published by the Research Committee of the Institution, on the properties and testing of transformer and switch oils (p. 48).

THE I.C.C. electric power scheme was defeated in

the Council on Tuesday, and the Bill cannot now be proceeded with this session (p. 49).

THE specifications published at the Patent Office last Thursday include a very simple form of electric steering gear control. Others relate to the "Fluvent" fuse and a method of improving the permeability of iron to small magnetising forces. One of the original Edison battery patents, a Berry transformer patent, and one relating to the Creed system of high-speed telegraphy expire this week after fourteen years' life (p. 50).

THE critical speeds of turbo-generators and the trueing up of commutators are dealt with in our "Questions and Answers" columns (p. 50).

DIRECT telephone communication has been established between New York and San Francisco (p. 51).

A NEW line of D.C. motors, an interlocking switch plug, and some electric cooking appliances are described in our Trade Section (p. 52).

EXTENSIONS are contemplated at Luton (£27,000); Blackpool (£24,500); Walthamstow (£14,590); mains, switchgear, &c., are required at Haslingden (£12,000); motors, &c., at Blackburn; and feeders and distributors at Newcastle-under-Lyme; electric lighting schemes are to be put in hand at Blackrock and Caerphilly, two water-tube boilers are required at Rotherham, and two rotaries at Stockton (p. 53).

IT was almost necessary to discontinue supply at Wimbledon on Tuesday, owing to shortage of coal.—The possibility of a bulk supply from Woolwich to Erith has again been raised (p. 54).

Arrangements for the Week.—(To-day) Thursday, Feb. 4th.—Greenock Electrical Society, 21 West Stuart Street. "Illumination," by F. B. Humphriss, 7.30 p.m.

Friday, Feb. 5th.—Royal Institution. "Science and Industrial Problems," by Prof. A. W. Crossley. 9 p.m.

Monday, Feb. 8th.—Electro-Harmonic Society. Concert (Ladies' Night), Holborn Restaurant. 8 p.m.

Institution of Mechanical Engineers. Graduates' Section. "History of the Metallurgy of Iron and Steel," by Sir Robert Hadfield, F.R.S. 8 p.m.

Tuesday, Feb. 9th.—Institution of Electrical Engineers, Manchester Section, Liverpool University. "Conditions Affecting the Variations in Strength of Wireless Signals," by Prof. E. W. Marchant. 7.30 p.m.

Institution of Electrical Engineers. Scottish Section, 207 Bath Street, Glasgow. "Distribution and Rise of Temperature in Field Coils," by Prof. Magnus Maclean, D. J. M'Kellar, and R. S. Begg. 8 p.m.

Rugby Engineering Society. "Modern Surface Condensing Plants," by T. R. Houston. 8 p.m.

Wednesday, Feb. 10th.—Institution of Electrical Engineers. Yorkshire Section, Technical College, Bradford. "Wireless Telegraphy," by Prof. E. W. Marchant. 7 p.m.

Institution of Electrical Engineers. Birmingham Section, University. "Polyphase Commutator Machines," by W. Shuttleworth. 7.30 p.m.

Institution of Automobile Engineers, at Storey's Gate, S.W. "Magneto-Ignition," by J. F. Henderson. 8 p.m.

Association of Engineers-in-Charge. St. Bride Institute, Fleet Street, E.C. "Boilers and Boiler Mountings," by Vernon Smith. 8 p.m.

THE QUEEN'S PARK EXTENSION OF THE "BAKERLOO" RAILWAY

THE latest extension of the Baker Street & Waterloo line of the London Electric Railway Co., from Paddington to Queen's Park, is important as being a step towards through running between this tube line and the London & North Western Railway, for it is ultimately intended to run through trains between the Elephant and Castle and Watford. The line was opened to traffic as far as Kilburn Park (Cambridge Avenue) on Sunday, and the intermediate station at Warwick Avenue, is also in use. The station between these two at Maida Vale (Elgin Avenue) is not quite complete, nor is the junction with the L. & N.W. Rly. at Queen's Park. The trains, however, are all run on to Queen's Park empty, as there is no cross-over at Kilburn Park. With the exception of a short length of surface line leading into Queen's Park, approached by an inclined cutting, the whole line is the standard 11 ft. 8½ in. twin tubes, enlarged to 21 ft. 2½ in. at stations, and 12 ft. on curves. There are some considerable gradients and curves on the line. A large amount of the detail work follows the standard practice of the London tube railways. The principal point of novelty is the total absence of lifts at all the new stations, which are provided with escalators, and this entails a slight difference in their general lay-out. Broadly speaking, they are of the island platform type, as the tubes are at a greater distance apart than usual, and a spacious lower hall communicating with the platforms and the bottom of the inclined escalator shaft lies between them without any long exit passages. There are also some differences in the sub-station and signalling equipment, described in more detail below.

One new sub-station, adjoining the Kilburn Park Station, has been established in connection with the extension, equipped with plant manufactured almost entirely by the British Thomson-Houston Co., Ltd. (Rugby). This installation is normally fed by one new 11,000-volt three-phase feeder cable direct from the Lots Road power house (see ELECTRICAL ENGINEERING, June 12th, 1913, p. 341), and there is also an emergency E.H.T. feeder, which is looped in at Baker Street. These incoming feeders are protected at the sub-station by multi-gap surge arresters with carbon resistances. The main converting plant consists of three 1,200-kw. B.T.-H. rotary converters permanently connected up to their transformers. They are provided with induction motors for starting up, and are wound for six-phase 25 cycles, running at 400 r.p.m. and delivering 600 volts D.C. The rotaries are provided with an automatic rocking-end play device, which, together with the lubricating qualities of the special brand of Morganite brushes used, keeps the slip-rings and commutators in excellent condition. The switches for the starting motors are alongside the machines at the operating handles for the 11,000-volt switches belonging to the primaries of each group of transformers are also on pillars by the machines. The switches themselves are in cells behind the L.T. switchboard, worked by rodding and provided with the usual automatic trips and synchronising arrangements. The E.H.T. bus-bars are in cells on a gallery above, where sectionalizing switches are provided to cut out any portion in case of emergency. The low-tension board on the floor level is of handsome grey marble on a pipework frame, and is very straightforward in its arrangement. Like all the switchgear, it was supplied by the B.T.-H. Co., but for the sake of uniformity with the other sub-stations it is equipped with Westinghouse circuit-breakers. The indicating instruments are by Everett, Edgcumbe & Co., and the meters by Chamberlain & Hookham, Ltd. Four traction feeders and one escalator circuit feeder are connected up, and two spare feeder panels are provided.

Two transformers of the Berry air-cooled type (supplied by the British Electric Transformer Co.), "Scott" connected across the three-phase supply, give a two-phase 220-volt supply for station and tunnel lighting, but a certain number of lights in each station are supplied from the local supply mains, to remain alight in case of the supply from Lots Road failing altogether. It is also the practice on the whole tube system to arrange the lights so that they can be supplied from a neighbouring sub-station in the event of the nearest sub-station having to shut down. There is also a special 50-kw. transformer to supply the signalling circuit at 400 volts A.C. This is not connected to the 11,000-volt supply mains, but to the 375-volt side of the transformers for the rotaries.

The track is of the same type as already familiar with the older portions of the London Electric Rly. Co.'s tubes, with a substantial felt packing piece under every chair to

deaden noise, and with the sleepers supported rigidly by concrete in the centre, but with only a loose packing at the ends to give a certain degree of spring to the track. The principal difference is in the use of slag wool for the packing under the ends of the sleepers, and Stuart's patent metal rail keys instead of wood. The surface portion is similar, but with the sleepers laid in ballast in the ordinary way. The conductor rails and insulators are similar to those used throughout the system. (A section of this form of track was given in ELECTRICAL ENGINEERING, Jan. 3rd, 1907, p. 38, in connection with another tube line.) Automatic signalling is used up to Queen's Park, where there is a semi-automatic frame with the usual illuminated diagram. The signal gear was supplied by the McKenzie Holland and Westinghouse Co., and is on the alternating-current all-electric system instead of the electro-pneumatic system, with continuous-current track circuits used on the original tubes. Bare telephone wires are stretched along the tunnels so that the driver of any train can communicate by his portable set in case of emergency, and these are connected up direct with the nearest sub-station. In the older parts of the line they were connected to the station platforms. Another novelty is the use of illuminated indicators on each section, which show the word "Stop" if the current goes off the section ahead.

The escalators or moving stairways were supplied by the Otis Elevator Co., and, running at 90 ft. per minute, can deal with 12,000 passengers per hour. At each station there is one ascending and one descending escalator, with a fixed emergency stairway between. The descending escalator is made reversible for use either when the other is disabled or to augment its capacity in special circumstances. Each is driven by a pair of 30-h.p. 600-volt motors running at 650 r.p.m. through a double worm-gear, similar to that used on the lifts, and spur-gearing and large sprocket-wheels engaging the chain by which the little trucks carrying the steps are propelled. The moving hand-rail is driven by chain-gearing. A solenoid starter giving automatic acceleration controls the motors, and clutches are provided so that either motor can be put out of action if necessary.

Ventilating plant is installed at Warwick Avenue and Elgin Avenue. In each case a 40-in. Sirocco fan driven by an 8.B.H.P. continuous-current motor draws in air, and passes it into ducts leading to the tunnel through a spray purifier, in which water is circulated by a small motor-driven centrifugal pump.

The station platform lighting is by 100-c.p. metal filament lamps in translucent glass bowls about 10 yards apart, and forms a fine example of the beauty and evenness of semi-indirect lighting. The escalators are lighted by 35-watt lamps placed in recesses in the ceiling in such a way as to shield them from the eyes of descending passengers. The appearance as well as the arrangement of the stations is a great improvement on some of the older tube stations that we have been accustomed to, and the ample but restful lighting increases one's power of appreciation of these good points. In conclusion, we wish to express our thanks to Mr. Z. E. Knapp, Construction Manager to the London Electric Railway Co., for permission to make a personal inspection of the sub-station and stations, and to those of the Company's staff who received our representative.

Annual Inspection of Commercial Motor Vehicles.—Although the usual Whit-Monday parade of commercial motor vehicles will not be held by the Commercial Motor Vehicle Users' Association, arrangements are being made for an inspection of the competing vehicles to be made, and a series of prizes to be given to drivers on the result of this inspection, combined with written and oral examinations, in connection with which a scheme of correspondence instruction is being prepared. There is a special section for drivers of electric vehicles. Particulars can be obtained from Mr. F. G. Bristow, Sec. Commercial Users' Association, 83 Pall Mall, S.W. In the electrical section, a first prize of £5, a second prize of £3, and a third prize of £2 are being provided by the Electrical Vehicle Committee of the Incorporated Municipal Electrical Association.

British Goods for the French Government.—The Board of Trade has issued a notice giving regulations for the export of articles for the use of the French Government. Application for permission to export prohibited articles must be made to the Commission Internationale de Ravitaillement, India House, Kingsway, W.C. and all documentary evidence of the destination of the goods must be approved by the correct department of the French Government. Application for permission to export goods to France for purely industrial purposes will continue to be made to the Commissioners of Customs and Excise, Custom House, E.C.

ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Published on the First Thursday of each month

ELECTRICITY IN MINES IN 1913

PART II. of the general report of the Chief Inspector of Mines for 1913 has recently been issued, and contains the report of Mr. R. Nelson, Electrical Inspector of Mines, dealing with the continued increase in the use of electricity in collieries, and the lessons to be learnt from the accidents which occurred during that year in connection with electrical working. He states that the total h.p. of colliery electric motors is 628,098 (of which 256,676 are on the surface and 371,422 underground), which is an increase of 22·97 per cent. over the figure for the previous year. The coal-cutting machines in use at the end of the year were 1,307 in number, an increase of 173 over the total for 1912.

Accidents.—The fatal accidents due to electrical causes were 15 in number, causing 18 deaths, in addition to a fire at Blaenavon resulting in the loss of 3 lives, which was held by some to have been due to failure of an electric cable, and the Senghenydd disaster, due "possibly but not certainly" to sparks from electric signalling apparatus. All the 15 fatal accidents referred to were due to shock, and 12 of them took place below ground. The total number in 1913 was 13, but in general during the last few years the number of fatalities relatively to the total electric power used in mines shows a decrease, in spite of fluctuations from year to year. Mr. Nelson is of opinion that 9 of the 12 fatal underground accidents might have been avoided by greater care in the maintenance of apparatus and stricter regard to the regulations.

The surface accidents include one due to accidental contact with an imperfectly insulated part of the winding of a 3,000-volt motor. Another was caused by a derrick pole guy-rope becoming live by contact with an unprotected 400-volt three-phase motor fuse, and the third was due to ignorance of a boy who climbed a railing and touched a wire purposely out of bravado.

Of the underground fatalities, 7 were due to contact with outer coverings of apparatus live through the absence of, or an inefficient, earth connection, 4 to defective insulation, and 2 to contact with uninsulated live parts.

Summarising the records of such accidents since 1905, Mr. Nelson finds that defective earthing has been responsible for very closely 50 per cent. of the deaths due to electric shock below ground, and imperfect insulation of cables has been responsible for 37 per cent. of the underground fatal shock accidents; one was on a low-pressure three-phase system, two on medium-pressure continuous-current systems, and the remainder on medium-pressure three-phase systems. Of all the three-phase accidents, including the surface as well as underground, ten were on completely insulated systems, and three on systems with the neutral earthed.

The non-fatal electrical accidents or dangerous occurrences are reported as 53, including 3 underground fires and 50 shock accidents, 30 below ground and 20 on the surface—in all, 51 persons were injured. In three of these cases the victim was unconscious, but was revived by artificial respiration. In four other cases serious injury by burns was caused. One was due to a spanner being dropped across live parts on a switchboard, one to accidental contact to live parts with a pair of pliers, one to failure of a trailing cable, and the other to examination of a switch known to be live. Another peculiar accident was the blowing-out of the glass in the peephole of a coal-cutter motor by explosion of volatilised insulating varnish due to a short circuit.

Prosecutions.—During the year 56 cases of prosecution of mine officials for contravention of the electricity regulations were heard and 24 convictions obtained, resulting in fines and costs aggregating £141 11s. There were 12 other cases in which charges in connection with electricity were taken together with other charges. In 12 cases workmen were charged with similar offences; all were convicted, and fines and costs amounting to £9 15s. were imposed.

Coal-cutting Machines.—Of the total of 2,897 coal-cutting machines in use at the end of 1913, 1,307 were electrically-worked, and of these 700 were in Scotland, 184 in the Northern district, 331 in the Yorkshire district, 18 in the

Manchester and Ireland district, 23 in the Liverpool and North Wales district, 36 in South Wales, and 70 in the Midland and Southern district; 725 were of the disc type, 377 of the bar type, 193 of the chain type, 5 of the percussion type, and 7 were rotary heading machines. The total number of electrical coal-cutters for the previous year was 1,134.

Electric Safety Lamps.—Another subject to which attention is given is the increasing use of electric safety lamps, in use since the facts brought out in the Whitehaven and Hulton colliery inquiries. In 1911, 4,298 of such lamps were in use, whereas in 1912 and 1913 respectively the totals rose to 10,727 and 37,823. During the year eleven types of safety lamp were tested by the Home Office, of which only two failed to pass the tests, and it is mentioned in the report from this department that one lamp has been approved which carries a gas-testing device, but the Home Office expresses no opinion as to the efficiency of this device. (See ELECTRICAL ENGINEERING, Dec. 3rd, 1914, p. 618.)

These lamps are distributed about the districts as follows:—Scotland, 1,160; Northern, 6,662; York, 25,004; Manchester and Ireland, 1,216; Liverpool, 385; South Wales, 2,716; Midland, 680. The makes of lamp used are:—Gray-Sussman, 10,283; C.E.A.G., 24,287; Oldham, 2,420; Wolf, 503; and other makes, 380.

SAFETY IN COLLIERY BELL SIGNALLING

IN the course of the investigations into the cause of the Senghenydd disaster, experiments were made by Dr. R. V. Wheeler, Chief Chemist to the Explosions in Mines Committee, showing the possibility of causing explosions of gaseous mixtures in certain circumstances by sparks from the ordinary system of signalling, by making contact between bare wires along a haulage road, and using unprotected bells. The matter has been gone into further, with the principle object of evolving a safe system, at the Laboratory of the Great Western Colliery Co.'s Coke Works, and the results of the experiments are contained in a Paper by Mr. T. G. Watts, published in the *Proceedings* of the South Wales Institute of Engineers. The same general method was employed, and the apparatus to be tested was introduced into a box filled with an explosive mixture of gases. The first experiments, with various mixtures, established the fact that coke-oven-gas and air mixtures are more easily ignited than methane and air mixtures, so that any apparatus shown to be safe in the coke-oven-gas mixture that was subsequently used was absolutely safe in methane mixtures. The possibility of ignition by the sparks from the contacts of an ordinary trembler bell as well as from sparks at the point of closing the circuit on the line was then demonstrated. A bell was next tried in which the contacts were shunted by a condenser, and it was found that the same bell which ordinarily produced ignition with four Léclanché cells produced no ignition when shunted by a condenser even with twelve cells. The author regards this method of protection as superior to attempts at rendering the bell flame-tight, especially those involving a vaseline-packed joint, as sometimes used. The condenser also lengthens the life of the bell contacts by eliminating sparking, and can easily be added to any bell.

Having thus proved the safety of the condenser shunted bell, the experiments were directed to applying the same remedy to the line contact. Here the condenser across the "knocking wires" did not eliminate the spark, but altered its character in a manner which prevented the mere bringing into contact of the two galvanised wires from causing ignition even with ten cells. When, however, contact was made with a file, ignition was produced by three cells. The provision of a condenser across the wires was therefore seen not to be a sufficient protection. An attempt was then made to lessen the current in the line wires by the introduction of a 10-ohm relay, but with three cells in the relay circuit ignition occurred, although the relay itself, with its contacts shunted by a condenser, had been proved safe. A 100-ohm relay was then tried, and six cells were required to produce ignition. As, however, this relay would work with two cells, even with

another 100 ohms in series with it, the author regards the margin of safety as sufficient with this system. The margin can be still further increased by putting a high resistance of some 2,000 ohms in shunt with the relay coils. This arrangement was proved to be safe up to ten cells, which is the maximum ever likely to be used in mine signalling of this character.

In the course of the discussion, Mr. H. Faraday Procter remarked that in addition to the vaseline clot bell which the author did not favour, there was another type on the market, in which a small spindle passed through a long hole and gave a quite flame-proof result. This rod was connected to the hammer, but only executed a rocking movement. The greater liability of the file contact spark to cause ignition was due to particles of metal disengaged. Still larger flashes were obtained with a sharp knife blade. He thought it would be sufficient to enclose the relay in a gas light case instead of shunting its break by a condenser.

ELECTRIC STEEL-MAKING FURNACES

A PAPER by Mr. T. D. Robertson on this subject was read before the Manchester Section of the Institution of Electrical Engineers on Jan. 26th. The first electric furnaces to work on a commercial scale were all constructed about 1899, viz., the Stassano furnaces in Italy, the Héroult in Savoy, and the Kjellin in Sweden, and from these three types the main classes now in use were developed. All of them used alternating current.

Broadly speaking, there were two classes of electric furnace—the induction furnace and the arc furnace. In the induction furnace, of which the Kjellin is an example, the metal bath is in the form of a ring-shaped trough forming the secondary of a single-phase transformer, with a rectangular iron core built into the furnace. This had certain disadvantages, which were overcome in the Röchling-Rodenhauser furnace (see ELECTRICAL ENGINEERING, Vol. IV., p. 17, July 2, 1908), with primary windings on both legs of the core surrounded by induction channels in the centre to form a working hearth of large dimensions. This middle part requires auxiliary heating, which is accomplished by a heavy secondary winding connected to plates embedded in the sides of the hearth. The larger furnaces of this pattern are constructed for three-phase working. Arc furnaces may be divided into arc radiation furnaces and arc conduction furnaces, according to whether the arc is between carbon electrodes only or between the electrodes and the charge itself. The Stassano three-phase furnace with its three inclined electrodes is an example of the former class which also includes the Rennerfelt two-phase furnace, with two horizontal and one vertical electrode. The earliest arc conduction furnace was that of Héroult. In its original single-phase form with two vertical electrodes, the current enters by one electrode, passes through the arc-gap, through the metal, and back through another arc to the second electrode. The position of the electrodes is regulated by motors acting through gearing and controlled by a Thury regulator. This furnace has the disadvantage of the surface of the charge being always hotter than the lower layers. The Girod single-phase furnace has one carbon electrode, and the current is conducted away from the charge by water-cooled iron studs embedded in the bottom of the furnace.

It was largely to get over the disadvantage of these studs and at the same time to obtain a furnace which will work from the usual supply mains through static transformers that the "Electro-metals" furnace was designed a few years ago. The original inventors were Messrs. Grönwall, Lindblad, and Stålhane, who developed the Elektrometall furnaces for the reduction of iron ores in Sweden. The development of their steel furnace has, however, taken place mainly in this country. Two-phase low-pressure current is obtained from a three-phase system through two "Scott" connected single-phase transformers. There are two upper electrodes, each carrying a separate phase, whilst in the bottom of the furnace beneath the basic lining is a third electrode which acts as a neutral return common to both phases. The lining, which is made of either dolomite or magnesite, is, when hot, quite a good conductor. If the pressure of each phase is 80 volts, there will only be a drop of about 3 volts through the lining. The heat developed by this is not wasted, as it serves to keep warm the lower portion of the furnace hearth. This two-phase arrangement gives rise to a certain amount of electromagnetic circulation.

The general construction of the furnace does not differ greatly from that of the other arc furnaces. The tank is made of steel plate suitably designed to avoid bulging when hot. The electrodes are held in steel holders carried on

horizontal arms, and fastened to a carriage which runs over and between two vertical channels. The carriage is driven by a vertical screw, and the worm gear by a small electric motor. The tilting gear is placed below and behind the furnace, and it is driven by a circuit motor. The roof, which is made of silica bricks, is held in a steel frame made separate from the furnace casing. The lining of the furnace is similar to that of most other furnaces, except that over the bottom plate there is a layer about $1\frac{1}{2}$ in. thick of carbon mixture, which when the furnace becomes hot is baked into a solid mass similar in composition and structure to the electrodes themselves.

The high-pressure electrical supply is taken to an isolating switch inside the high-pressure cubicle, and from this it is divided into two circuits, each of which passes to an oil switch, with auxiliary contacts for charging resistances, to neutralise the effect of any sudden loads on switching in. It is found in practice that a fairly high pressure, say 80 volts, gives the best results during the melting stage, but that as much less power is required for the subsequent refining, a lower pressure is desirable, as this gives much less wear and tear on the furnace roof and sides, especially during the latter stages of the process. In order to have these two pressures at the ready command of the operator, the switches are connected to tappings on the high-pressure side of the transformers, one tapping to give a high pressure of, say, 80 volts, and the other to give about 50 volts. These two switches are interlocked so that only one of them can be put in at one time.

The current is controlled by raising and lowering the electrodes. In small furnaces this adjustment is made by hand, but in the larger ones a motor is in conjunction with a Thury automatic regulator set to regulate the current on each phase at a definite figure. Direct control is also effected by drum type controllers, which, in conjunction with speed regulators, enable the electrodes to be quickly hoisted out of, or lowered down into, the furnace.

In addition to the melting of cold materials, electric furnaces are largely used for refining fluid metal taken from open-hearth furnaces or Bessemer converters, this practice being more common in America and on the Continent than it is in this country. In America there is a big field open for the electric furnace in the manufacture of even such common material as steel rails. In this country, concluded the author, the field for the electric steel furnace is mainly in the manufacture of tool and alloy steels, for making the smaller sizes of steel castings, and possibly in connection with the open-hearth and Bessemer plants for producing a superior product. Abroad, however, especially in those regions where water power is plentiful and electrical energy can be produced very cheaply, it is possible, in fact probable, that electric furnaces will be used to produce steel in large quantities instead of employing the older class of fuel-fired furnaces.

ELECTRIC MINERS' LAMPS IN AMERICA

AFTER investigating a number of patterns, the American Bureau of Mines has approved three electric lamps for use in fiery mines. One is the C.E.A.G. lamp, well known on the Continent and in this country, and the other two, known as the "Hirsh" and the "Wico" lamps, are designed to be worn in the miner's cap and connected to their battery by flexible leads. Both of these are of the bull's-eye pattern with parabolic reflectors, and are provided with devices for extinguishing the lamp on breakage of the outer glass. The Bureau has put forward a specification for electric miners' lamps for discussion and criticism, of which the following are the main points:—Intensity of light at all times, 0·4 candle-power. Flux of light at all times: for hand lamps, 30 lumens; for cap lamps, 1·5 lumens. Time of burning per charge, 12 hours. Average life of bulbs: for primary batteries and acid storage batteries, 300 hours, for alkaline storage batteries, 200 hours. Variation in current consumption of bulbs, 10 per cent. above average. Variation in candle-power of bulbs, 15 per cent. below average. Average life of batteries: for primary batteries and acid storage batteries, 3,600 hours; for alkaline storage batteries, 7,200 hours. Angle of reflector, 130°.

Mining and Metallurgical Patents.—No electrical patents specifications relating to mines have been published by the Patent Office during the last month. An electrometallurgical specification is No. 1,437/14 of E. F. K. Harbeck and B. Läu (Sweden), which describes a method of producing a malleable form of electrolytic iron, using an electrolyte consisting of a solution of an iron salt of hydrofluoric acid or hydrofluosilic acid is used, with no other metal in the solution.

PREVENTION OF BREAKDOWNS IN COLLIERY ELECTRICAL PLANT

A PAPER on this subject by Mr. Llewellyn Foster has recently been read before the Lancashire Branch of the Association of Mining Electrical Engineers. Generally speaking, said the author, breakdowns of mining electrical plant may be divided into three classes:—(1) Those caused by lack of attention and care, including want of systematic periodical opening out of the machines for inspection, cleaning, and overhaul. It is very seldom that we find any system of periodically taking machines apart for overhaul, or that the windings receive a coat of varnish except after repair. If the windings were kept clean and varnished occasionally a number of breakdowns would be prevented. (2) Those due to the machines being quite unsuitable for their work and situation. In mining work particularly, open or protected-type machines are often used when they meet the requirements of the Regulations, whereas, on account of the surrounding dust and dampness, the enclosed type, with separate fans, or preferably pipe-ventilated (if it is possible to use them) should have been used. (3) Those due to faulty design, defective material and workmanship. There are many machines with poorly-designed bearings, which allow the oil to creep on to the windings, where, as a consequence of its mixing with dust, surface leakage takes place and breakdowns occur.

One of the most frequent sources of trouble on alternating-current electrical plant in mines is due to the fact that a machine is left running as a single-phase owing to one of the three fuses having melted. A considerable proportion of breakdowns occur on the commutating parts of continuous-current machines, viz., commutators, brush-gear, &c., and sparking at these parts does not receive the careful attention it requires. Some of the causes of sparking are wrong position or unequal spacing of brushes, unsuitable brush thickness, and bad fit of the brushes in their holders. In this connection aluminium is spoken of as being a better material than brass for the brush-box on account of its lower coefficient of expansion. The condition of the insulation between the commutator bars has also to be carefully attended to. Fractured conductors and commutator connections and flats on commutator bars are mostly due to vibration, and through consequent chafing and pounding of the insulating material "earth" faults are caused. Knocking and jarring are due often to loose pulleys, pinions, and couplings on the driving or driven shafts. Regular measurements of the radial air-gap should be taken and recorded, as well as the test of lifting the shaft in its bearings.

On some colliery plants, where originally protected-type motors were installed, these have been converted into totally-enclosed machines, but without any reduction of the load. In one case this resulted in the solder melting out of the commutator spokes, the commutator being badly burned, but the machine was kept at full power until it broke down. This unsatisfactory condition of affairs could not be ascertained until the motor was opened out to localise the cause of the trouble. The reduced rating of a motor when totally enclosed is often lost sight of by the manager, and he is usually responsible for having the motor made totally enclosed.

The switch blades and contacts of the stator circuit, and the fuse fittings and contacts require regular and systematic examination. All ends of cables, connections, &c., should be soldered to prevent the danger of the machine running on incomplete phases. The satisfactory storing of spare parts, armatures, and such like is also a matter that requires careful arrangement, as the life of a part practically depends on this. Some pits are naturally very wet, and breakdowns frequently occur through dampness percolating into the windings of the motors and to the starting gear. In order to comply with the Home Office Regulations, the colliery mechanical engineer or his assistant is supposed to periodically examine all machinery above and below ground. If this rule was strictly enforced, the percentage of electric breakdowns would undoubtedly be reduced.

AN ELECTRICALLY DRIVEN ROLLING MILL

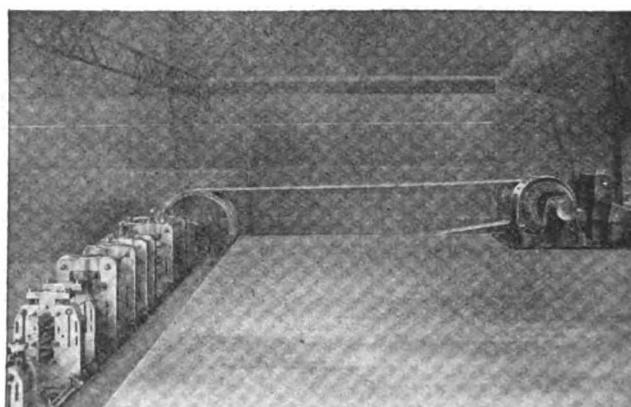

A LARGE firm of Birmingham steel workers, finding that their business had increased so rapidly that the existing plant could not cope with it, decided to lay down a new 10 in. electrically-driven mill for rolling steel ingots down to various small sections such as bicycle rims, &c. A general view of the rolling mill, with the driving motor, is shown in the figure. The motor, rated at 350 h.p., is of the "Witton" three-phase induction slip-ring type, and is started through

a G.E.C. dust-tight liquid starter. Power is supplied by the Birmingham Corporation at 5,500 volts three-phase. It passes to a G.E.C. mistake-proof boiler-plate motor-control panel. In addition to the usual gear, this panel contains a set of choking coils to protect the end turns of the induction motor at the instant of switching on. The mill consists of one set of three-high pinions gearing down on to four sets of three-high rolls and one set of two-high rolls. The drive from the motor is by cotton ropes on to a 7-ton flywheel carried on a shaft running in self-oiling dust-proof bearings.

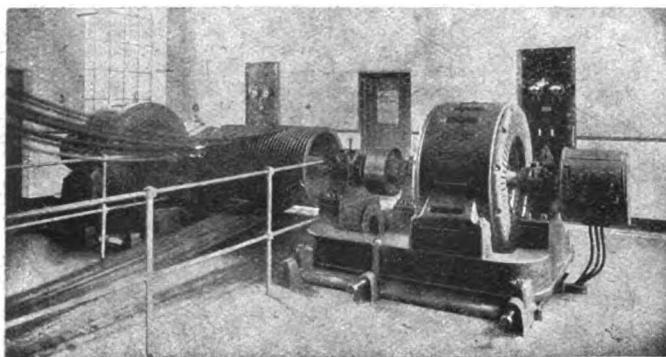

ROLLING MILL DRIVEN BY THREE-PHASE MOTOR.

A special feature of the installation is that provision is made for the easy adjustment of every part which can possibly require it, and everything is done to facilitate the changing of the rolls when this is required. The mill, which is one of the latest examples of this type, was built by Thos. Perry & Sons, Ltd., of Bilston, and the whole of the electrical equipment was supplied by the General Electric Co., Ltd. (of Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.). The photograph was taken at a time when the motor was not housed in, but in actual operation it is totally enclosed by a suitable erection.

ELECTRICALLY DRIVEN COLLIERY FANS

A COLLIERY ventilating fan installation which presents points of interest has recently been laid down at the Deep Navigation Colliery, of Ocean Collieries, Ltd.; at Tre-harris, South Wales. In this installation two motors have been installed, each of 300 h.p., driving a centrifugal fan in tandem. The present requirements of the colliery only call for one 300-h.p. motor, but by installing two similar motors, each capable of meeting the present requirements, but together adequate for the ultimate requirements of the colliery, it is possible to operate the motors economically now, and at the same time have a stand-by. When the requirements of the colliery increase up to the anticipated maximum of 600 h.p., the difference in efficiency between the two 300-h.p. motors and the one 600-h.p. will be comparatively negligible, while at those times when it is desired to cut

MOTORS DRIVING VENTILATING FANS.

down the ventilation of the colliery one 300-h.p. motor can be utilised when operating at its maximum efficiency. A view of the motors is given in the figure, from which it will be seen that the motors are mounted on a combination bed-plate with the rope driving pulley and shafting independently carried by pedestal bearings. Between each motor and the pulley a coupling is fixed, and by the removal of a small distance piece between the two holes of the coupling either motor can be disconnected. The motors are of the standard "Witton" three-phase pattern for 2,300 volts, 50 cycles. They have wound rotors with short-circuiting and brush-lifting devices. The pulley is 38-in. diameter, and takes 30 ropes each of 1½-in. diameter. For controlling the motors standard "Witton" boiler-plate cubicles were installed, as seen in the illustration. The electrical plant was supplied by the General Electric Co., Ltd. (Witton and Womanby Street, Cardiff, &c.).

SWITCH AND TRANSFORMER OILS

THE Research Committee of the Institution of Electrical Engineers recently appointed a Sub-Committee to investigate the properties of switch and transformer oils, and to consider the advisability of standardising oil tests. In order to obtain information on the subject, a circular letter was issued putting forward nineteen questions to manufacturing firms and research laboratories. The answers to these have been collated and reported on by Mr. W. Pollard Digby. His report appears in the Journal of the Institution. Many of the questions related to sludge formation. It is generally agreed that sludging is purely a chemical phenomenon, and is due to oxidation by the air forming certain complex organic compounds. The liability of an oil to sludge can be estimated by a short period test in which ozone is employed as an oxidising agent instead of air, and with different oils the amount of sludge produced varies from 0·6 to 20 per cent. It is believed that by keeping air entirely away from the oil, sludge formation would be completely prevented. The tendency to its formation is accelerated by increase of temperature, but no amount of cooling can reconvert the sludge into oil. A good deal depends on the degree of refinement of the oil, and grades of oil are known which show no sludging up to 160° F. The formation of sludge does not appear to have much effect on the electrical properties of the oil, but, as is well known, the absorption of moisture has a very deleterious effect, and its presence is more easily revealed by electrical than by chemical tests. A suggested standard of quality in this respect is a specific resistance of 200,000 megohms per c.c., and a dielectric strength of 10,000 volts between a needle point and a disc ½ in. in diameter, 100 mils apart. Another matter discussed

is the methods of testing the capacity of oils for thermal transference, and the carbonising effect of an arc in switch oils.

Diesel Engine Users' Association.—At the last meeting of this Association, the question of the use of Mexican fuel oil was discussed, and letters were read from several firms or undertakings who had used this class of fuel. A report on the influence of sulphur in liquid fuels used in internal-combustion engines was also referred to. The question of the Admiralty specification for fuel oil was discussed, and the Committee of the Association were requested to collect further information on the subject of specifications for this class of fuel with a view, possibly, of eventually preparing a standard specification. Mr. G. Porter (of Worthing) had prepared some notes on the subject of Diesel engine insurance, and it was suggested that the insurance offices should be approached with a view of discussing with them the whole question of insurance against breakdowns, for which a wide variation in rates obtains at the present time. The next meeting is to be held on Friday, Feb. 19th, at the Institution of Electrical Engineers. Information and particulars concerning the Association can be obtained from the Acting Hon. Secretary, Mr. Percy Still, at 19 Cadogan Gardens, London, S.W.

Advanced Lecture Courses.—A special advanced course of lectures on "Design of Alternating-Current Turbo-Generators" will be given by Prof. Miles Walker at the City and Guilds (Engineering College), South Kensington, commencing Wednesday, February 10th. Another course on "Design, Manufacture, and Uses of Transformers," by Mr. A. P. M. Fleming, will commence on March 4th. Full particulars can be obtained from the Registrar.

THE FUTURE OF LONDON'S ELECTRICITY SUPPLY

The L.C.C. Scheme Defeated

THE London County Council electric power scheme was defeated at the meeting on Tuesday on a vote upon a report of the Parliamentary Committee recommending that the previous decision of the Council to promote its electric supply bill be confirmed. This vote was necessary under Section 4 of the Borough Funds Act of 1872. Voting was not on strictly party lines, as a considerable number of Progressives, although not satisfied with the scheme, because it was not a purely municipal one, voted for it in the interests, as they believed, of Greater London generally. Under the Borough Funds Act it was necessary that there should be an absolute majority of the Council in favour of the Bill, and this meant that there must be 69 votes in favour of it. On a show of hands, however, only 60 were in favour, and on the subsequent division, 61 votes were recorded in favour of the scheme, and 32 against. It cannot, therefore, be proceeded with this session.

The arguments now put forward by those who voted against the scheme—many of whom voted in favour of it when it was before the Council on the last occasion—were mainly that in view of the serious opposition now threatened by the Borough Councils these members felt that they could not sacrifice their principles and again vote for a non-municipal scheme. It was further contended that although the technical side of the scheme had been most thoroughly gone into and evidence had been taken from Birmingham, Glasgow, Chicago, and Berlin—the witnesses including Sir John Snell and Dr. S. Z. de Ferranti—the administrative side had been dealt with in a most perfunctory manner. Indeed, it was suggested by Mr. Percy Harris that the whole of the details had practically been worked out during a week-end by the L.C.C. Engineer, who at the same time had his thoughts engaged by main drainage and other schemes, by the Controller, and by Mr. C. H. Merz, the Council's consulting engineer. These gentlemen had not had a free hand, but provided a scheme according to instructions. Mr. H. H. Gordon (Stepney) suggested that the scheme should be reconsidered apart from its technical aspects. The whole basis of it was wrong, for whether a London Borough Council took power in bulk from the new Authority or not they would have to share in any deficiency rate which might have to be levied. The essence of any good scheme must be consolidation. Alderman Mills (Progressive), who was for some time Chairman of the Islington Electricity Committee, was in favour of the Bill going forward, and suggested that no scheme put forward by the L.C.C. to deal with this problem would ever be accepted by the Borough Councils who, for the most part, were strongly of the opinion that nothing could be done better than they were doing themselves. The pride of Stepney, he said, was its electricity undertaking, and the glory of St. Pancras was its turbines, and if anybody waited for the time when a piece of legislation promoted by the L.C.C. received the benediction of a Borough Council, they would have to wait a very long time. Sir John Benn suggested that the Companies were strongly opposed to the proposed Technical Committee.

The members of the Moderate Party, on the other hand, appealed to the Progressives not to take up an uncompromising attitude in this matter, and to let the Bill have the benefit of a Parliamentary inquiry where, if it possessed all the demerits which had been suggested, it would meet with the fate it deserved. It was frankly put to the Progressive Party that the Moderates did not anticipate being able to secure the attendance of sufficient members to carry the vote, owing to so many of them being away on active service, but in reply to this it was suggested that if the Moderate Party as a whole had not been put under a pledge to support the scheme, a good many members of that Party would either not vote at all, or would vote against it. The point was further emphasised, by the Moderates, that the defeat of the Council's scheme would leave the Companies' Bill in full possession, and that it was doubtful whether the L.C.C. would carry much weight before the Parliamentary Committee which dealt with that proposal.

In the end, however, the scheme was defeated as mentioned above.

Previous to the above debate, Mr. Johnson asked the Chairman of the Electricity Supply Committee how many Borough Councils owning electricity undertakings had intimated their intention to support the Bill; how many not

owning electricity undertakings had done likewise; how many existing railway and traction companies had approached the Council regarding the possibility of their taking a supply in the event of the Bill becoming law, and what negotiations had been carried on with any company, body, or person with a view to their being constituted the operating company under the Bill. Mr. G. H. Hume said that with regard to the first two questions, it was not the practice of Metropolitan Borough Councils to intimate their intention to support Bills promoted by the L.C.C., neither was it possible at this stage for railway and similar companies to approach the Council. As to the last question, negotiations had been opened with practically all the London companies in different groups with a view to one of these groups being constituted the Operating Company, and these negotiations were still going on.

A comprehensive and detailed report had previously been issued by the Conference of Metropolitan Boroughs owning electricity undertakings. Most of the arguments put forward have already been noted in our columns. In regard to the suggestion in Messrs. Merz and McLellan's report, however, that by 1920, under the new scheme, an average saving of 34 per cent. will be possible on the prices ruling in 1911, it is pointed out that between 1902-3 and 1911-12 the price of electrical energy has fallen by 43 per cent., and the inference is that by continuing under present conditions a greater saving will be effected by 1920 than is estimated by the L.C.C. Attention is also called to the fact that no mention is made in Messrs. Merz and McLellan's report to the fact that municipal undertakings in London are supplying energy for heating and cooking at a uniform charge of 1d. or even less per unit, nor that the extended use of electrical energy for these purposes depends primarily on the cheapening of the necessary apparatus.

On the financial side, importance is laid upon the suggestion that the necessary capital for the scheme can be borrowed at 4 per cent. This is regarded as impossible, and that the figure would be at least 5 per cent. Taking this as the basis, it is shown that instead of estimated surpluses in 1920 of £20,000 and in 1925 of £97,000, there will be deficits of £121,000 and £183,000 respectively. Particular stress is laid upon the periods for repayment of loans. Authorised distributors are now allowed by the County Council 25 years for cables and 15 years for plant and machinery, but the L.C.C. proposes to allow 40 years and 25 years respectively to the new Electricity Supply Authority. If, says the report, the L.C.C. will treat the newer capital of the existing authorities similarly, many of them will be prepared to reduce their charges at once by 20 per cent.

Finally, it is suggested that equally good, if not better, results could be obtained by compulsory linking-up and co-operation under the Electric Lighting Acts of 1908-9, instead of allowing the powers under these Acts to remain entirely permissive. At the same time, the financial policy of the L.C.C. with regard to loans is held responsible for holding back progress in the past. With more lenient annual capital charges a large extension of linking-up between various stations would result both with municipal and company undertakings.

The attitude of the London Borough Councils owning electricity works was well summed-up in a letter in the *Evening News* of Monday by Mr. J. Horace Bowden, General Manager of the Poplar Electricity Works. In this he stated he would be prepared to advise his Council to withdraw all opposition to the L.C.C. Bill if it were modified to allow existing undertakers to continue as at present, with power to link up with other undertakings so long as the local cost of production is cheaper than would be the case if energy were purchased from the bulk supply authority; that no restrictions were placed upon extensions to existing stations or distributing mains; that similar periods for the repayment of loans as were proposed for the new authority should be allowed; and that local authorities should be permitted to claim exemption from the rateable area for which it was proposed to levy rates for any losses incurred by the new authority.

Technical Scholarships.—The London County Council are prepared to award 15 scholarships for full-time day instruction and a number of exhibitions for evening instruction tenable at technical institutes, &c. Applications must be sent in before Feb. 27th on forms obtainable from the Education Officer, Victoria Embankment, W.C. Full particulars are given in the L.C.C. Scholarship and Training of Teachers Handbook (price 1d., post free 3d.).

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Jan. 28th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

15,879/13. Radiators. P. R. WILDE. A radiator of the lamp type, provided with a water reservoir in the lower part and a series of wicks, one behind each lamp, to humidify the atmosphere. This radiator was described in ELECTRICAL ENGINEERING, Aug. 30th, 1914, p. 245. (Nine figures.)

22,575/13. Fuses. V. HOPE. Porcelain handle replacement fuses, in which the fuse wire passes through an oblique hole in the porcelain body of the fuse carrier, and the handle is well shielded from the fuse. This fuse, which is known as the "Fluvent" fuse, was described in ELECTRICAL ENGINEERING, Dec. 10th, 1914, p. 634. (Seven figures.)

24,274/13. Fuses. V. HOPE. This specification describes a method of assembling the above fuses to form distribution boards by threading the bases on a circular bus-bar, about which they can pivot independently to facilitate connecting up or inspection. (Ten figures.)

73/14. Electric Steering Gear, &c. W. H. SCOTT. This system of applying electric power to supplement hand power is applicable to steering gear, lock gate and sluice opening, and a number of purposes. A coupling allowing of a certain amount of slack is provided between the controlling hand wheel and the work, and contacts are provided, so that one set are closed when the drive is in one direction, and another set when the drive is in the other direction. These contacts, acting through suitable relays, &c., start the motor in the direction to assist the motion, and the motor runs as long as the movement is followed by the hand wheel. As soon as the motor begins to overrun, the contact is opened and the motor stops. The drive is through a centrifugal or other clutch, which leaves the motor disconnected when it does not start up owing to failure of current, so that the hand gear can be used alone. (Four figures.)

194/14. Enhancing Permeability of Iron. E. WILSON. In view of the fact that the permeability of iron for small magnetising forces is greater if it has not been previously subjected to a certain degree of magnetisation, it is suggested in this specification to enclose the iron in a case of magnetic material to shield it from the earth's field during preliminary demagnetisation or heat treatment. This applies, in particular, to cores of Pupin coils and the travelling bands of magnetic detectors. (Five figures.)

Specifications Published To-Day.

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

DYNAMOS, MOTORS AND TRANSFORMERS: RILEY [Motor control] 17,038/14.

Electrometallurgy and Electrochemistry: DETTIFOSS POWER CO. and LIDHOLM [Cyanamide furnace] 28,629/13; B.T.-H. CO. (G.E. Co., U.S.A.) [Coating metals with zinc] 9,367/14; MILLS (Hanson & Van Winkle Co.) [Electroplating] 14,358/14; MACHALSKE [Furnace electrodes] 15,456/14.

Heating and Cooking: HAWKES [Heating elements] 7,145/14.

Incandescent Lamps: B.T.-H. CO. (G.E. Co., U.S.A.) [Incandescent lamps] 5,456/14.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS. A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within

Storage Batteries: SVENSKA ACKUMULATOR AKTIEBOLAGET JUNGRER [Accumulator cells] 123/14.

Switchgear, Fuses and Fittings: VETTER [Lamp holders] 24,422/13; CRAVEN BROS., LTD., GARNER and HORROCKS [Limit switches] 29,366/13; HORSTMANN, HORSTMANN, HORSTMANN, HORSTMANN and EDGAR [Clock switches] 415/14; MASCARINI and CONTARDI [Resistances] 590/14; GREENE [Switches] 1,008/14; B.T.-H. CO. (G.E. Co., U.S.A.) [Controller locks] 3,217/14.

Telephony and Telegraphy: DERRIMAN (Automatic Enunciator Co.) [Telephones] 28,838/13; PFANNENSTEHL [Tape transmitter] 10,364/14; MARKS (Canadian Independent Telephone Co.) 11,564/14; JENSEN and PRIDHAN [Telephone set] 12,656/14; KESSELS [Telegraph receiver and keyboard transmitter] 13,018/14.

Traction: WILSON [Car lighting] 27,542/13; MIDGLEY and VANDERVELL [Car-lighting dynamo] 1,341/14; TAUNTON and ELECTRO-MECHANICAL BRAKE CO. [Trolley wheels] 6,652/14.

Miscellaneous: SOC. ANON. DES AUTOMOBILES ET CYCLES PEUGEOT [Transport of searchlights] 11,084/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

DYNAMOS, MOTORS, &c.: ALLMANA SVENSKA ELEKTRISKA AKTIEBOLAGET [Motor speed regulation] 22,732/14.

Miscellaneous: GES. FÜR ELEKTRO-OSMOSE [Treatment of materials for impregnating them electro-osmotically] 21,190/14.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

2,490/01. Storage Batteries. T. A. EDISON. This is one of the original patents for the Edison alkaline storage battery, and covers the use of electrodes of hydrated oxide of nickel or cobalt in a closed container and oxide of iron. An early form of construction of plate is described, and one of the claims is for mixing graphite with the active material.

2,607/01. Transformers. A. F. BERRY and THE BRITISH ELECTRIC TRANSFORMER CO., LTD. Transformers with the cores of radially arranged bundles of strips constructed with several magnetic circuits to form self-contained polyphase transformers.

2,834/01. Telegraphy. F. G. CREED and W. A. COULSON. Improvements in high-speed automatic transmitting and receiving instruments, whereby the movements of the sending and receiving strips are synchronous.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: W. MATTHIESSEN [Flame arc lamps] 22,631/06.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: B.T.-H. CO. (G.E. Co., U.S.A.) [Voltage regulation] 23,415 and 23,416/09.

DYNAMOS, MOTORS AND TRANSFORMERS: M. MILCH [Control of induction motors] 22,863/06; SIEMENS BROS. DYN. WKS. (Siemens Schuckert) [Commutation system of rotary converters] 23,291/09.

Electrochemistry and Electrometallurgy: T. A. SMITH and T. DEAKIN [Electroplating] 21,687/08.

Ignition: R. J. ISAACSON [Ignition] 23,177/09; A. S. J. CHAPMAN [Ignition] 23,319/09; H. L. DOWN and TELEPHOS, LTD. [Lighting and extinguishing gas lamps] 24,309/09.

Batteries: H. F. JOEL [Primary cells] 22,547/06; H. LEITNER [Secondary cells] 22,807/06.

Switchgear, Fuses and Fittings: O. A. MYGATT [Prismatic lamp globes] 20,635/01; SIEMENS BROS. DYN. WAS. (Siemens Schuckert) [Cartridge fuses] 22,106 and 22,108/02.

Miscellaneous: F. DESSAUER [Roentgen ray apparatus] 23,455/09.

seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,428.

A 200-volt, single phase, 10-amp., 41·5 period meter is fixed to register the consumption of a double wire 200-100-volt trans-

former. As the supply is 200 volts, 83 periods, how will this affect the reading?—J. M.
(Replies must be received not later than first post, Thursday, Feb. 11th.)

ANSWERS TO No. 1,426.

In a turbine-driven 25-kw. direct-current dynamo running at 5,000 r.p.m., it is observed, when running up, that there are several periods before the armature reaches top speed when undue vibration occurs. This vibration does not continue, but comes at intervals, whilst the machine is increasing in speed. What is the cause and remedy? In machines of this class, what is the best method of trueing commutators which are uneven due to wear?—R. W. S.

The first award (10s.) is made to "M" for the following reply:—

The vibration observed by the questioner when starting up the turbo-generator is due to the speed of the machine corresponding with the natural period of vibration of the armature shaft. This vibration will always occur whenever this particular speed—called the critical speed—is attained, and will pass off as the speed changes. It will also take place, or tend to take place, whenever the speed attains a value which is a multiple of the critical speed. The only remedy is to stiffen the shaft to such an extent that its natural period of vibration is well above the normal speed of the machine. There are, however, practical difficulties in the way of this, and it is usual for manufacturers to design high-speed machines of this type, so that the normal speed falls midway between two critical speeds to insure smooth running. There is no real danger in vibration such as referred to above provided it does not become excessive; it is, however, a wise precaution to bring the speed up quickly past the critical point, and on no account allow the machine to run at the critical speed for any length of time. It is a mistake to make the bearing brasses of high-speed machines too tight, because when vibration occurs the shaft whirls slightly, and unless there is sufficient clearance in the bearings to allow the shaft to temporarily take up a slightly curved formation, undue strains will be set up.

In reply to the last paragraph of the question, the best method of trueing up the commutator of the machine referred to is to grind it, making use of one of the various commutator grinders on the market. If this is not obtainable, and a sufficiently large lathe is available, then the armature may be removed and turned. Care must be taken to use a very sharp tool and light cut, to avoid tearing the copper and bridging the gap between the segments.

The second award (5s.) is made to "A. G. R." who writes as follows:—

The cause of "R. W. S.'s" trouble is undoubtedly due to the "whirling" of the shaft when passing through its critical speeds. When a loaded shaft is rotating, the centre line of the shaft will not coincide absolutely with the axis of rotation owing to the load, the weight of the shaft, want of stiffness, vibration, &c. Hence centrifugal forces due to inertia will produce a bending moment on the shaft, tending to deflect it, and increased deflection will result in increased centrifugal forces. These forces are proportional to the deflection and to the square of the speed, and are resisted by the elastic forces of the shaft. As the speed increases, a value will be reached at which the centrifugal forces will exceed the elastic forces, and instability will result; this critical speed at which instability sets in, and the shaft whips out of centre, is called the *whirling* speed of the shaft. If, when the whirling of the shaft occurs, the speed is increased, the shaft will not tend to become more unstable, but the vibrations will die down and normal conditions will again be restored. There is an infinite series of whirling speeds, but, even with turbines, the second is very rarely reached, though the first is often passed through before normal speed is reached.

As long as the second whirling speed is not reached (and it is generally far removed from the first), I do not think that "R. W. S." need worry. Of course, the only remedy is to increase the diameter of the shaft, or, if possible, reduce the distance between the bearings.

With regard to the methods of trueing commutators, only the two most common methods need be mentioned:—(1) That employing a turning tool, (2) that employing a grinding tool. In this case it is assumed that this is required to be carried out without uncoupling the machines. The apparatus for the first method consists of a simple tool post for holding the cutting tool, mounted on suitable ways and fitted with a cross-feed screw. The tool must be mounted very rigidly to prevent chattering, and a cutting speed of 550 feet per minute has been found best. Unless such a tool is operated

by an expert, too much may be turned off before a satisfactory job is obtained. Also few commutators have a normal peripheral speed as low as the cutting speed required. A rotating grinding wheel, so arranged that it can be fed backwards and forwards by means of a lead screw, constitutes by far the best arrangement in this case. The advantages of such a tool are that the minimum amount of copper is removed, a perfect cylindrical surface is obtained, and the work may be done with machine at full speed. The success depends upon the tool being rigidly supported and having closely fitting bearings so that no vibration occurs. Grinding is probably slower than turning, but it undoubtedly gives a better surface.

ANSWER TO CORRESPONDENT

L. R.—Your reply to No. 1,426 is in many ways excellent, but "in judging the replies, importance will be attached to clearness and conciseness, as well as accuracy."

TELEPHONY AND TELEGRAPHY
(INCLUDING WIRELESS)

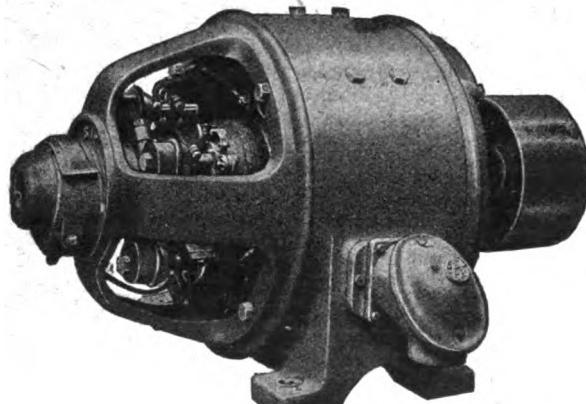

In a lecture on long-distance telephony, reported in ELECTRICAL ENGINEERING on April 2nd, p. 191, Prof. J. A. Fleming mentioned that the longest telephone line—from New York to Denver, some 2,000 miles—was being extended to San Francisco, a total length of 3,000 miles. It was announced in last Thursday's *Times*, by their New York correspondent, that this had now been accomplished, and that, in fact, other lines had been joined up with this one, as an experiment, and speech was transmitted over 5,000 miles. Congratulations over the wire were exchanged between the President of the United States (at Washington), the Mayor of San Francisco, the veteran Prof. Graham Bell, and Mr. Vail, head of the American Telephone & Telegraph Co. (at Jekyll Island, Georgia). While this may not yet be the limiting distance over which speech can be transmitted on "loaded" lines, yet it is premature to speak, as the *Times* correspondent does, of Transatlantic telephony being foreshadowed, although naturally the temptation is great, since the distance between New York and London is far less than 5,000 miles. That a cable between the two continents is not inherently impossible may be admitted, but the difference between cable and overhead transmission is so great that the problem will be an economic one long after it has ceased to be one presenting any scientific difficulties. It is useless to estimate the probable cost of such a cable until the great nations of Europe have been at peace for many years.

Mr. A. A. Campbell Swinton delivered his Presidential Address to the Wireless Society of London on Tuesday, Jan. 26th. This is Mr. Campbell Swinton's second year of office, and but for the war a new President would have been elected. He urged members to strictly obey restrictions at present placed upon wireless working. His own apparatus had not only been dismantled, but actually taken away by the Post Office, and he hoped all members of the Society would follow his example. As President of the Society he had been able to interest himself in one or two cases and obtain an alleviation of the very severe penalties incurred, where the offence was obviously technical and thoughtless. During the past few months the Society had been of some assistance to the Post Office, it having furnished a number of operators to that department. The number was not so great as might have been hoped, but the standard set was a very high one. Assistance had also been given in other directions, and the written thanks of the Post Office and Home Office had been received. At last year's meeting wireless messages were exchanged with the Eiffel Tower, but that was not possible this year. Col. Ferrié, however, had sent a cordial message, to which he proposed to send a suitable reply, congratulating him also upon his advance in rank from Commandant. Continuing, Mr. Campbell Swinton said that as he was debarred from demonstrating anything approaching wireless, he had thought of some of the old experiments which led up to wireless, and which twenty years ago excited widespread interest. The rest of the evening, therefore, was devoted to a demonstration of spinning eggs and balls in a magnetic field, a brief description of the history of the Leyden jar, and subsequent work by Tesla and Elihu Thomson on spark gaps, experiments showing the effects of self-induction, Crookes' tubes effects, and the Duddell musical arc.

"ELECTRICAL ENGINEERING" TRADE SECTION

A NEW LINE OF CONTINUOUS CURRENT MOTORS

WE have received from the British Thomson-Houston Co., Ltd. (Rugby), particulars of a new line of continuous-current motors, known as the DR. type, which they are introducing. This is of an exceptionally robust construction, and commutating poles are used throughout the entire range, enabling a very wide range of speeds to be secured by field control, and the practically entire absence of sparking ensures a long life of both commutator and brushes. The latter when once correctly set require no change in position for any fluctuation in load. The quality of sheet steel and insulating compound used in the laminated armature core and poles reduces hysteresis and eddy current losses to a minimum, and friction losses are minimised by the use of low-friction metal with ring lubrication. The magnetic structure is so arranged as to render the motors free from objectionable hum, and internal ventilation is provided by the back of the armature. The commutator is also provided with ventilating ducts. All these motors are designed for an overload capacity of 25 per cent. for thirty minutes, or a momentary overload of 100 per cent., and all protected, enclosed ventilated, drip-proof, and pipe-ventilated type motors will run for six hours with a temperature rise

NEW DESIGN OF CONTINUOUS-CURRENT PROTECTED TYPE MOTOR.

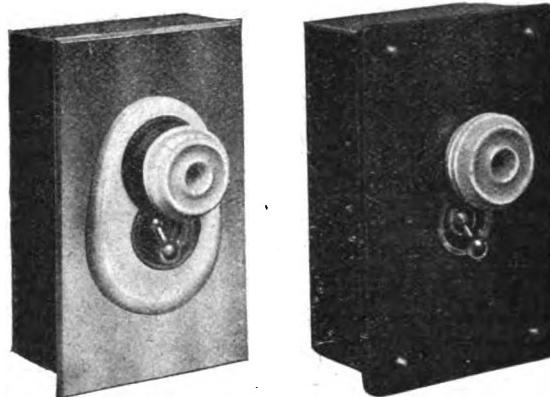

(measured by thermometer) not exceeding 40° C. (72° F.). All motors are subjected to a high potential test of 1500 volts A.C. for a period of one minute immediately after a heat run at the factory.

In the protected type the armature, field coils, and other live parts, are mechanically protected, while free ventilation is not impeded. The enclosed ventilated type has the end-shield openings further protected by perforated metal covers of not less than $\frac{1}{8}$ in. mesh, while in the drip-proof type all the openings are so protected as to exclude drops, splashés, falling chips, etc. The totally enclosed type has the openings enclosed with either sheet metal, or has solid cast-metal covers, a special commutator end-shield with machined joints being supplied for this purpose. In pipe-ventilated motors one of the solid covers is fitted with a flanged pipe intake. Motors can be readily converted from one type to another by a change of covers or end-shield; the bolt holes in the end-shields are so spaced that they can be turned through 90° or 180°, allowing the motor to be mounted on the floor, wall, or ceiling. The poles are bolted direct to the magnet frame in such a manner as to permit of removal, together with the field spools, without displacement of the armature. The leads are brought out of the motor casing through rubber bushes into a cast-iron junction-box, which is provided with screwed outlet for conduit wiring. A standard protected-type motor is illustrated here.

INTERLOCKING SWITCH-PLUGS

APATTERN of interlocked switch-plug mounted in cast-iron box for use on conduit installations has been introduced by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.). When the plug is inserted and the switch is in the

"on" position, the dolly lies over the extended flange of the plug, thus making it impossible to withdraw the plug without switching off. Similarly it is impossible to insert the

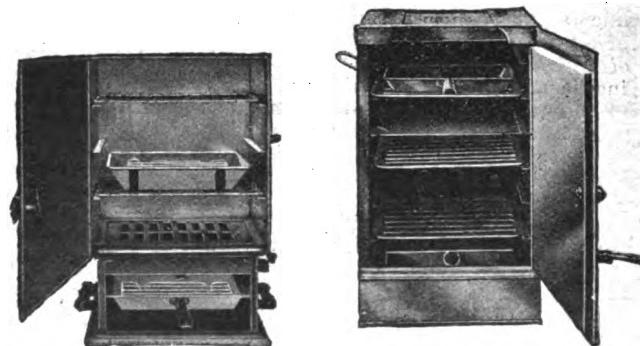

FLUSH PATTERN INTERLOCKING SWITCH-PLUGS.

plug whilst the switch is on. Two flush forms are illustrated, one with a black fibre cover and the other with brass and porcelain front. Hand-shield plugs can be used instead of the type illustrated.

ELECTRIC COOKERS FOR FLATS

WE illustrate here two patterns of inexpensive electric cooker which have been developed by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), to meet the need for an outfit that either can be hired out by the supply authority at a moderate rental or purchased by the consumer. They are both specially adapted for situations where space is limited. The set in Fig. 1 consists of a magnet hot-plate and griller of the pattern illustrated in ELECTRICAL ENGINEERING, Nov. 26th, 1914 (p. 613), upon which is mounted a bright sheet-steel oven giving a cooking space of 12 x 12 x 9 in. The heating element is just under the perforated top of the grill, and is arranged in two circuits taking 750 watts each. When no grilling is being

OVEN MOUNTED ON ELECTRIC GRILL.

OVEN WITH TOP AND BOTTOM HEAT.

done, a reflector plate is slipped in under the heater, directing all the heat up into the oven. The design of the hot-plate is such that an uninterrupted uniform current of hot air ascends into the oven. The oven in Fig. 2, which is made under Patent No. 17,688/13, is a self-contained piece of apparatus with heating elements both at the top and at the bottom, and is larger in sizes, having a cooking space of 15 x 12 x 12 in. The sub-division of the top and bottom heating elements and the use of series parallel grouping enables eight degrees of heating to be obtained with consumptions varying from 200 to 2,200 watts. The top heat can be used for grilling. This oven also differs from the other in that it has double walls with a still air-jacket between. Earthing terminals are provided on both models, which can be used if thought necessary.

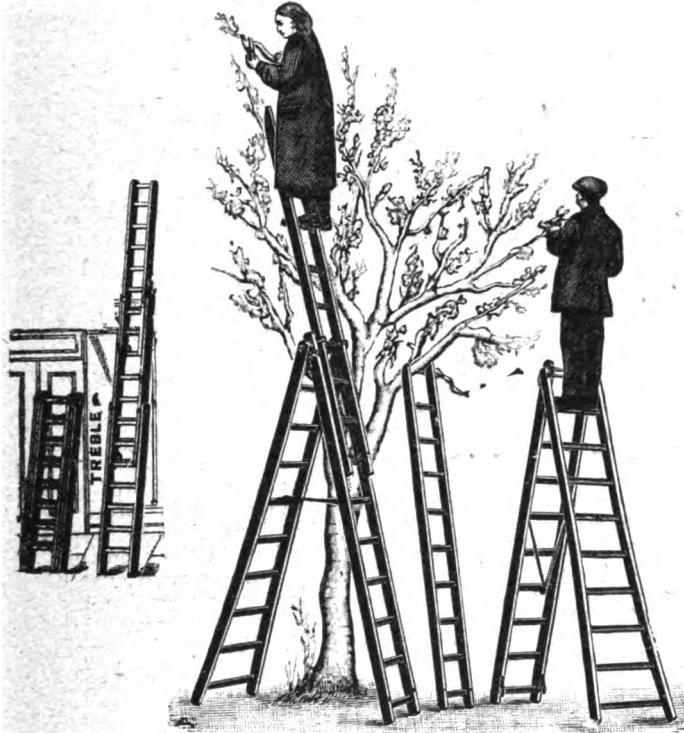

CATALOGUES, PAMPHLETS, &c., RECEIVED

IRONCLAD SERVICE FUSE BOXES.—It has been pointed out to us that the last sentence in our notice last week of the new catalogue of Ironclad service fuse boxes issued by W. T. Henley's Telegraph Works Co., Ltd., is liable to possible misconstruction. The boxes in question are all manufactured by the firm themselves, and what we wished to say was that all their types are not listed, as new designs are being introduced at such a rapid rate that it is impossible for any catalogue to keep pace with them.

CONCEALED LIGHTING.—A complete series of reflectors and fittings for use with tubular lamps, all most carefully designed to obtain a maximum useful efficiency by the distribution of the light exactly where it is wanted, has been issued by A. W. Beuttell, Ltd. (109 Victoria Street, S.W.). The range comprises strip fixtures for shop window showcase, and other concealed lighting, with various styles of trough reflectors, including a neat wood moulding strip, portable showcase, shop-window, and poster illuminating reflectors, desk lamps, ceiling lighting by light reflected on to specially curved diffusing surfaces, and theatre footlights. These fittings are covered by patent.

A CONVENIENT LADDER

WE illustrate here a new form of triple ladder which has been put on the market by J. H. Heathman (Parsons Green). As will be seen, the three ladders are

available for use separately or together, or can be converted into a self-standing trestle with or without extension. They are light in weight, although durable and strongly made.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Blackburn.—Twelve months' supply of motors, motor-starting switches, house service fuse-boxes, insulating material, &c. Borough Electrical Engineer. Feb. 13th.

Blackpool.—The Corporation proposes to apply for borrowing powers for £24,500 for electricity extensions.

Blackrock.—A L.G.B. inquiry was held last week concerning a loan of £13,000 for the Council's electric lighting scheme. Several members of the Council opposed on the ground that the scheme had not been sufficiently considered and that adequate expert advice had not been obtained.

Caerphilly.—A local electric supply company has just been registered with a capital of £6,000. The solicitors are Seymour, Williams & Co., 38 Parliament Street, S.W.

Haslingden.—A loan of £12,000 is to be sought for mains, services, transformers, and switchgear.

Limerick.—A Local Government Board inquiry was held last week into an application by the Corporation for a loan of £5,000 for additional plant at the power station.

Luton.—Extensions at an estimated cost of £27,000 are contemplated. Additional mains are also required.

Netherlands.—H.M. Consul-General in Rotterdam, says the *Board of Trade Journal*, reports a demand in the Netherlands for electric cable and wires. Communications to the British Consulate-General, Rotterdam.

Newcastle-under-Lyme.—L.T. feeders and distributors. Borough Electrical Engineer.

Rotherham.—Two water-tube boilers, mechanical stokers, economisers, superheaters, &c. Borough Electrical Engineer, Feb. 22nd.

Stockton-on-Tees.—Two 500 kw. rotary converters, transformers, and starting apparatus. Borough Electrical Engineer, Feb. 19th. (See an advertisement on another page.)

Walthamstow.—A loan of £14,590 is to be taken up for electrical extensions.

Wiring

Cardiff.—New technical institute, Cathays Park. Borough Electrical Engineer. Feb. 22nd.

Leeds.—Tuberculosis hospital. City Engineer, Feb. 10th. School. Education Architect, Feb. 17th.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Ayr.—New school.

Burnley.—Extensions to Victoria Hospital (£25,000).

Dundee.—New school (£22,700). Architects, M'Laren, Sons & Soutar.

Fleetwood.—Police station, Wyre Dock (£4,000).

Littlehampton.—Isolation hospital. Council's Surveyor.

London: Stepney.—New municipal buildings.

St. Austell.—Technical school (£3,400).

Miscellaneous

Eccles.—The question of street lighting is receiving consideration.

Ireland.—The Midland Railway Co. requires six or twelve months' supply of telegraph material, electric lamps, carbons, &c. Secretary, York Road, Belfast.

London: St. Marylebone.—Stores for electricity department, including cable, insulating materials, flexible cord, etc. Town Clerk, February 17th. (See an advertisement on another page.)

Manchester.—General stores for tramway department. Chairman of Tramways Committee, February 16th. (See an advertisement on another page.)

Sheffield.—Twelve months' supply of electrical fittings for the Cleansing Department. Town Clerk. Feb. 13th.

Stalybridge.—The Joint Board's Electrical Engineer is making experiments in the lighting of workmen's dwellings.

Stockton-on-Tees.—Miscellaneous stores for various departments, Feb. 16th. (See an advertisement on another page.)

West Bromwich.—As a number of the Corporation's petrol omnibuses have been taken by the War Office, the purchase of four electric chassis is recommended.

York.—Six double-deck cars are required. Tramway Manager.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Manchester.—The Electricity Committee has accepted the following tenders:—Two 500 k.v.a. transformers, Johnson & Phillips; one 500 kw. motor converter, Bruce Peebles & Co.; cable and purchase of copper on behalf of Committee, British Insulated & Helsby Cables, Ltd.

Neath.—A twelve months' contract has been placed with the Electrical Apparatus Co., Ltd., for meters.

Messrs. J. Kaye & Sons, Ltd., inform us that since the war they have received orders from the War Office for 29,436 oil-cans, and that, without competition, the Admiralty has renewed its three years' contract, which ended in November last. In addition, the Navy has ordered 7,170 oil-cans and 6,228 patent seamless spouts since the war began.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £68 to £68 10s. (last week £66 10s. to £67).

New Branch.—Fife, Wilson & Co. (155a St. Vincent Street, Glasgow) have opened a London office at Broad Sanctuary Chambers, 11 Tothill Street, Westminster (telegrams: Ductility Vic. London; telephone: Victoria 6921), in charge of Mr. A. G. Tucker, for the sale of "Kelvin" petrol and paraffin engines, &c., generating sets, quarto-watt heaters, &c.

Liquidations.—A meeting of the creditors of the Altheat Co., Ltd., was held on Monday. The total liabilities are £370, and the value of the assets is estimated at about £207, in addition to two patents. Mr. Alfred Slatter, a director of the Company, is liquidator, and the meeting appointed Mr. E. H. Hawkins, of the Colebrookdale Co., the chief creditors, to act as joint liquidator.

Mr. E. T. Kerr, of 95 Colmore Row, Birmingham, has been appointed receiver for the debenture holders of the British Prometheus Co., Ltd., Salop Street, Birmingham.

APPOINTMENTS AND PERSONAL NOTES

Mr. Alexander Siemens, who, besides being a director of the Siemens companies in this country, is also a Past-President of the Institutions of Civil and Electrical Engineers and Chairman of the Engineering Standards Committee, has written the following letter to the Royal Institution, of which he is Secretary:—

"It has come to my knowledge that a short declaration on my part, with regard to my position as a British subject, and with regard to my sentiments about the war, would be acceptable to the managers of the Royal Institution. I, therefore, venture to lay before you the following statement:—I have been born in Hanover, both my parents having been British subjects until Hanover was separated from the United Kingdom in accordance with the provisions of the Salic Law. In the year 1866 the kingdom of Hanover was annexed by Prussia, and thereby universal military service was introduced. In July, 1867, I first came to England, and I went back to Germany in 1868 to absolve my military duties, but I was not accepted on account of my shortsightedness. I had, however, to present myself again, when the war against France broke out in July, 1870, and I joined a regiment of the Line for one year. In October, 1871, I returned to London, where I have resided ever since. As it became probable that I should spend my life in this country, I resolved to follow the example of the late Sir William Siemens by becoming a naturalised British subject. To carry out this plan I obtained my formal release from German citizenship in March, 1878, and my certificate of naturalisation (No. 2,671) was filed at the Home Office on August 16th, 1878. Thus I have been a subject of the kingdom of Hanover for 19 years, of Prussia for 12 years, most of which time I spent out of Germany, and of the United Kingdom for over 36 years, nearly all of which I spent in London. As a consequence my sympathies in this war are entirely on the side of the Allies, and I cannot express strongly enough my abhorrence of the way in which Germany has disregarded international treaties and conventions, as to the conduct of hostilities, and more particularly of the raids made on unfortified watering-places in this country. I should like to add that in return for the advantages I have enjoyed as a British subject, I have done my best to serve this country whenever an opportunity for doing so presented itself to me."

Mr. J. C. Williams, Deputy Borough Electrical Engineer and Tramways Manager at Rotherham, has been appointed Borough Electrical Engineer and Tramways Manager at Erith at a commencing salary of £350 per annum.

Mr. A. J. Cridge has accepted a position with the British Westinghouse Electric & Manufacturing Co., Ltd., and has taken up his duties at Trafford Park.

Mr. J. T. Wilson has been appointed agent to the Cremer Lamp & Engineering Co. for the London district at their office at 39 Victoria Street, S.W.

Mr. A. J. Beckett, Borough Electrical Engineer at Bridlington, has received a Commission in the Royal Engineers.

Particulars of positions for switchboard attendants, shift engineers, telephone engineers, &c., are given in our advertisement columns.

LOCAL NOTES

Accrington: *Staff and Enlisting.*—The Electricity Committee reports that several of the technical staff are desirous of joining the colours, but as their places will be extremely difficult to fill, the Council's opinion as to what course should be taken is asked.

Belfast: *Electricity Works Administration.*—On Monday the recommendation of the Tramways and Electrical Committee that Alderman Tyrrell, Alderman Finnigan, Councillor Duff, the Electrical Engineer, and the Town Clerk's Chief Assistant be appointed to visit Bradford, Sheffield, Leeds, and Greenwich to obtain information as to administration and other matters relating to the electrical undertaking, was approved.

Burnley: *Staff and Enlistment.*—The Electricity Committee has intimated to Mr. J. E. Starkie, the Borough Electrical Engineer, Mr. T. Taylor, the Assistant Electrical Engineer, and Mr. G. D. Clegg, Switchboard Attendant, their inability to consent to these gentlemen enlisting.

Erith: *Bulk Supply.*—A suggestion from the Woolwich Council that Erith should take a supply of electrical energy in bulk from it, has been deferred for the consideration of the new Borough Electrical Engineer, whose appointment is announced elsewhere in this issue.

London: *Woolwich: The Plumstead Power Station.*—Sir John Snell in his first report upon the working of the Council's electricity undertaking suggested that the Plumstead power house should be closed. He now recommends that this power station should not be shut down entirely, but should be continued in use by the destructor steam only, and be held ready for reserve purposes.

Maidstone: *Ljungstrom Turbine.*—A recommendation of the Electricity Committee that the Brush Engineering Co., Ltd., be asked to tender for a 1,000 kw. Ljungstrom turbo-alternator has been passed by the Council.

Price of Current.—Large consumers have been notified that, owing to the price of coal, it may be necessary to increase the price of current, presumably in accordance with the coal clauses in the contracts.

Wimbledon: *Shortage of Coal.*—A circular was issued to consumers on Tuesday, stating that, owing to difficulties in transport of coal, the electricity works might be compelled to restrict the output of electricity for all purposes at any time after midday yesterday. As a result of pressure on the L. & S.W. Railway Co. and the military authorities, the Corporation have obtained an assurance that in future they would receive regular deliveries of coal sufficient to keep the works running in the ordinary way; but, in the event of the Railway Co. failing to deliver this morning certain quantities arranged, the Corporation would have no alternative but to close the works. In consequence, there was a rush in the district for candles, lamps, and oil. Fortunately some deliveries of coal were obtained in time, but the works have still to rely on supplies from day to day.

Flexibles for Pendants.—In view of the greater stress put upon the flexible cords in many modern fittings than was the case formerly, the General Electric Co., Ltd. (67 Queen Victoria Street, London, E.C.), has decided to discontinue the use of flexibles with strands of Nos. 38 and 40 gauges, and always to use such a number of strands of No. 36 gauge as to give an equivalent section in solid copper.

The Society of Engineers.—At a meeting last Monday Mr. Norman Scorgie gave his Presidential Address dealing principally with municipal engineering. Among the premiums, &c., presented was the President's gold medal to Mr. A. S. E. Ackermann for his Paper in the utilisation of solar energy.

CHEQUES TO BE MADE PAYABLE TO THE KILOWATT PUBLISHING CO., LTD., AND TO BE CROSSED LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

SUMMARY

WE give some details of a scheme for linking up the Hackney and Poplar electricity undertakings (p. 56).

AN interesting preliminary point has been decided in the action by the British Thomson-Houston Co., Ltd., v. Duram, Ltd., regarding alleged infringement of a metal filament lamp patent (p. 56).

AT a recent meeting of the "Point-Fives," a discussion was held on electric supply for heating and cooking (p. 56).

A PAPER describing several types of polyphase commutator motor for variable speed and other work has been read by Mr. N. Shuttleworth before the Birmingham Local Section of the Institution of Electrical Engineers (p. 57).

A PAPER by Mr. T. R. Houston, read before the Rugby Engineering Society, dealt with some interesting points connected with surface condensing plant (p. 57).

AT a meeting of the London Branch of the Association of Mining Electrical Engineers on Friday, Mr. E. Kilburn Scott read a paper on lightning and surge protection (p. 58).

ALTHOUGH the actual shortage of coal is not so serious as it was, prices have risen greatly, and, if this is not checked, a general increase in the charges for electric supply may occur (p. 58).

A NUMBER of technical books are reviewed (pp. 58 and 59).

THE possible causes of unsatisfactory running in parallel of induction motor generators are discussed in our "Questions and Answers" columns (p. 59).

A PAPER read before the Scottish Local Section of the Institution of Electrical Engineers contains results of experiments on the heating of field coils (p. 60).

ATTEMPTS are being made to re-introduce the L.C.C. Electric Power Bill at a special meeting of the Council (p. 60).

THE causes of two recent runaway tramcar accidents are referred to in our Electric Traction Notes (p. 60).

A PAPER by Prof. E. W. Marchant before the Manchester Local Section of the Institution of Electrical Engineers contains results of an investigation into the conditions affecting the strength of wireless signals.—The stations for direct wireless communication between Norway and America are in an advanced stage of construction.—A few further particulars of the New York-San Francisco telephone line are given (p. 60).

AMONG the specifications published at the Patent Office last Thursday was one for the use of resistances with a negative temperature coefficient for starting induction motors. A B.T.-H. patent covers the thinning down of lamp filaments near the points of support to allow for the cooling effect. One of the Highfield booster patents expires this week after a full life of fourteen years (p. 61).

A NEW locking lampholder, an ironclad distribution board, a star-delta starter and a new design of searchlight are described in our trade section, which also contains an illustrated article on an interesting system of concealed lighting (pp. 62 to 65).

GENERATING plant is required at Redditch (£28,000); Walthamstow (£14,590); mains and services at Gillingham (£6,750); superheaters at Manchester; cable, mains, etc., at Hammersmith, Bootle, and Dewsbury; mains, transformer, and sub-station equipment at Worcester (£5,250) (p. 65).

THE Electric Lighting Companies in Westminster refuse to make a reduction in the charge on account of reduced lighting.—The War Office has commandeered generating plant from the Brush Company's Works intended for Batley, Kettering, and London.—The Wigan Electric Lighting Committee has rescinded a contract placed with a firm whose capital is largely held by Germans.—There is a large amount of opposition to the Yorkshire Electric Power Co.'s Bill (p. 66).

Arrangements for the week will be found on p. 66.

The Anglo-Norwegian Trade Journal.—This is a new publication, of which the first number has just been issued by the Norwegian Chamber of Commerce (44-46 Kingsway, W.C.). A quantity of information regarding supply, demand, facilities, and restrictions relating to trade between this country and Norway.

"LINKING UP" IN LONDON

THE Hackney and Poplar Borough Electrical Engineers have prepared reports with regard to linking up the two electricity undertakings which, if they can be acted upon, will result in Shoreditch, Stepney, Poplar, and Hackney being permanently interconnected. Already Poplar and Stepney have been giving one another reciprocal supplies in such a way that the Poplar plant has been entirely shut down from midnight until about 6 a.m. the following morning, and Mr. Bowden, Borough Electrical Engineer at Poplar, estimates that by being able to shut down his plant during the uneconomical night load he is saving over £400 per annum. Hitherto there have been certain circumstances which have prevented the Hackney and Poplar electricity undertakings being linked up, but with the completion of the Hackney new plant, recently described in our columns, and the laying of the E.H.T. ring main, the chief difficulties have been overcome. Certain heads of agreement have now been formulated, and it is suggested that either party shall supply energy to the other at the price of 0·25d. per unit without any fixed charges being paid. The period of the agreement is to be for twenty years, with revision of price by mutual agreement every five years. The cost of the necessary mains and switchgear for effecting the link is estimated at £2,720. The Hackney Electricity Committee recommends that the Town Clerk be instructed to confer with the Poplar Town Clerk with a view to drafting an agreement to be submitted to the Board of Trade later.

METAL FILAMENT LAMP LITIGATION

A COURT of Appeal, consisting of Lord Justices Buckley and Pickford, on Thursday had an interesting point to decide in connection with the patent infringement action now pending between the British Thomson-Houston Co., Ltd., and Duram, Ltd. In December, Mr. Justice Neville had before him an application by Duram, Ltd., for what is known in legal phraseology as "discovery" of documents. In other words, Duram, Ltd., claimed that, in order to be able to frame their defence to the alleged infringement, they should have access to certain documents of the British Thomson-Houston Co. The allegation in the defence is that the British Thomson-Houston Co. has not been adequately working the patent in question, namely, No. 21,518* of 1906, in this country, but that it is necessary that access should be given to documents in the possession of the British Thomson-Houston Co. to prove this. Generally it is alleged that the filaments under this patent have been imported by the British Thomson-Houston Co., Ltd., from America, Germany, and Holland, and the defence also includes an application under Section 27 of the Patent Act of 1907 for the revocation of the patent in question on the ground that the patented process is not worked wholly or mainly in the United Kingdom.

For the British Thomson-Houston Co. it was argued that this application by Duram, Ltd., was in the nature of a "fishing" application; in other words, an attempt to ascertain details of a competitor's business. Such an application, it was further contended, was within the discretion of the Court to deal with, quite apart from any regulations laid down under the Patent Act, and this discretion Mr. A. J. Walter, K.C., asked the Court to exercise on the ground that to grant Duram, Ltd., what they required would be oppressive.

Eventually the Court decided that Duram, Ltd., were entitled to the "discovery" of documents which would show the extent to which the British Thomson-Houston Co. has imported filaments from abroad, but that such discovery should not include any names of customers of the British Thomson-Houston Co. This decision, in fact, was in accordance with an offer made by Mr. Terrell, K.C., for Duram, Ltd., during the arguments.

Old Centralians.—In view of the fact that a very large number of members are at present serving with the Colours, while others are working at the highest pressure in order to ensure a maximum production of armaments and war stores, it has been decided that the annual dinner will not be held this year. For the same reason it has been decided to make no changes in the officers of the Association.

Iron and Steel Institute.—The annual meeting will be held at the Institution of Civil Engineers on May 13th and 14th, and the annual dinner is provisionally fixed for May 13th. It has also been decided provisionally to hold the autumn meeting in London during the week ending Sept. 25th next.

THE POINT FIVES

AT a meeting of the "Point Fives" on January 15th an address was given by Mr. H. Gray (Accrington), who urged that the energy of the Association should be directed to encouraging the heating load in shops, hotels, etc., as well as in private residences, and recommended a tariff based on a sliding scale of percentages on rateable value and a fixed price per unit. This would also, in his opinion, obtain a considerable additional lighting load in such premises. Referring to details of domestic appliances, he said that the hot bar "fire" was rapidly superseding the lamp radiator, largely because more kilowatts could be concentrated into a given space. He also described a church installation in which cold down draughts were entirely done away with by a ring of hot bar strips at a considerable distance from the floor taking 20 kw. With regard to cookers, he said that the fight between price and quality had been steadily progressing, and at present a thoroughly reliable article could be obtained at a reasonable price provided that all elaborations are excluded. A cooker built on similar lines to a gas cooker, of cast-iron, having removable fittings, with hot plate and grill on the top of the oven, and without circuit indicators, thermometer, and inspection window, etc., appeared to give satisfaction in the majority of cases, but for better-class work, where the customer would pay an increased price, useful elaborations were much valued. There was a tendency where there was room to have the griller and boiling rings removed from the oven and put on one side. The oven could, of course, in this case be raised to a more convenient height. The standardising of hot plates might present difficulties. The author was still of opinion that the radiant heat (red hot) plate would be ultimately the most satisfactory type. Rapid operation could never be effected if the heating element had to heat up an iron plate as a preliminary to the heat being passed on to the cooking vessel.

There was some difference of opinion expressed in the discussion as to whether the shop and hotel problem came within the objects of the Association, which, Mr. Pickvance (Wrexham) pointed out, were simply to foster the consumption of electrical energy for domestic purposes. Again, shop lighting did not need special aid for its development, nor any complicated system of charging to attract. Mr. S. T. Allen (Wolverhampton) was also against applying the rateable value system to shops, and Mr. Shaw (Ilford) thought that the maximum demand system was most suitable. Mr. Cook (Luton) went so far as to urge the flat 4d. rate without any annual charge for all heating and cooking. Mr. Long (Norwich) thought that this could be done for private houses, where the diversity factor was great, but was doubtful as to shops. With regard to the points raised as to the apparatus used, Mr. Allen did not believe that the present time was a suitable one for an attempt to standardise cookers, as development was so rapid, and might turn along totally different lines from those followed at present. Mr. Rolls (Bradford) mentioned that in his district the demand for lamp radiators had almost ceased, but the trouble with the hot-bar style has not been in selling them, but in getting them from the makers. Mr. Beauchamp (West Ham) drew attention to the advantages of combined radiators and convectors, and Mr. Seabrook (Marylebone) spoke of the economies to be effected by the adoption of thermostatic control.

The National Illumination Committee of Great Britain.—This committee, which was constituted by co-operation of the Institutions of Electrical and Gas Engineers, the National Physical Laboratory, and the Illuminating Engineering Society, consists of Messrs. E. Allen (chairman), W. Duddell, and A. P. Trotter (vice-chairmen), W. J. A. Butterfield (Secretary and Treasurer), Frank Bailey, J. Bond, H. C. Colman, K. Edgcumbe, L. Gaster, R. T. Glazebrook, F. W. Goodenough, Haydn T. Harrison, J. Kerr, J. T. Morris, C. C. Paterson, S. P. Thompson, and R. Watson. Of these Messrs. Duddell and Colman have been appointed representatives on the Executive Committee of the International Commission on Illumination. The annual report states that the work of the committee has consisted mainly in the establishment of rules and the appointment of officers. Regarding the rating of light sources the following resolution has been passed:—"It is desirable that a uniform International method be adopted for rating and marking all sources of light. It is recommended by the National Illumination Committee of Great Britain that the matter be considered at the next session of the International Commission on Illumination, and the administration of that Commission is asked to take the necessary steps to bring this resolution to the knowledge of the different National Committees with a view to their co-operation." A sub-committee has been appointed to draft sets of definitives and nomenclature.

POLYPHASE COMMUTATOR MOTORS

A PAPER on polyphase commutator motors and their applications, by Mr. N. Shuttleworth, was read last night before the Birmingham Local Section of the Institution of Electrical Engineers. After some general remarks on the effect of a rotating field on an armature with three brushes, these machines were classified into series and shunt, the former implying constant field usually associated with constant speed under load, and the latter with compound excitation with varying speed under load. The real advantage of the commutator machine over the induction motor was the possibility of speed variation without loss of efficiency. For single speed work its advantage of improved power factor was not sufficient to outweigh the increase in cost.

The Latour motor is fitted with three-phase compensating winding and a three-phase armature. Instead of using a separate shunt exciting winding, the armature winding is used for this purpose, and an exciting voltage is impressed between the brush studs from the secondary of a transformer, the primary of which is connected to the supply system. The armature winding of the motor therefore carries in addition to the load current an exciting current, which produces the working field of the motor. The windings of the transformer carry only a wattless current, which is at right angles in phase to the voltage induced from the primary. The latter fact enables a very simple means to be employed for varying the terminal voltage of the secondary of the exciting transformer, and for this purpose the star point of the secondary is completed through a variable reactance. A voltage-drop due to the magnetising current flowing through the reactance is exactly opposite in phase to the voltage induced in the secondary of the transformer; since the voltage appearing in the windings is constant under all conditions, the terminal voltage impressed on the brushes of the motor will depend upon the magnitude of the voltage-drop in the reactance, and the reactance is therefore a means of varying the impressed voltage on the field winding of the motor—this being done also without any change in phase. It will be observed that the reactance is strictly analogous to the field rheostat of a continuous-current shunt motor, the transformer is made with a movable secondary, so that the phase of the voltage obtained may be varied. A six-pole 25-B.H.P. motor of this kind can have a speed variation of 50 per cent. above and below synchronism, but for large sizes the speed range is much more limited.

Another example of a variable-speed motor with shunt characteristics is the Eichberg three-phase commutator motor, which has an armature fitted with a compensating winding, and exciting voltages are impressed from the auxiliary auto-transformer, permanently connected in star to the supply system, and provided with tappings, each of which may in turn be connected to the brushes. By varying the ratio of the two arms in each phase of the auto-transformer there is a different ratio between the armature and compensating-winding voltages on the motor, and this implies variable armature speed. This type of machine cannot be built in very large sizes owing to commutation difficulties.

The development of the series commutator motor was retarded by commutation difficulties. The stator winding is similar to that of an induction motor, and the armature is similar to that of a continuous-current motor. The extremities of the stator winding are connected to the motor terminals and to brush studs on the commutator respectively. It is now usual, however, instead of connecting the stator winding directly in series with the armature, to introduce a transformer which reduces the voltage impressed on the armature; this is necessary to improve the commutating conditions, but it incidentally isolates the armature and commutator from the supply system, and therefore allows the stator winding to be designed suitable for a high-tension system. An alternating-current series motor can exert any required torque over a considerable speed range, and this is rendered possible by the simple movement of the brushes round the commutator relative to the stator. It is not suited for constant-speed work, but may be used to drive fans, blowers, centrifugal pumps, and such machinery as calendering and calico printing.

Another important application of the polyphase commutator motor is in cascade with a variable-speed induction motor for utilising the energy otherwise lost in the rotor circuit. In the Krämer method the shaft of the commutator motor is coupled direct to the main motor. This is effective provided the speed is moderately high, and a low-speed motor requires an unnecessarily expensive commutator motor. The other method is well known, and is due to Dr. Scherbius.

The commutator motor is direct coupled to a squirrel-cage induction generator, which in turn is electrically connected to the supply system. A further development, due to M. Milch, is to employ the commutator motor as a commutator generator and to run the induction motor above synchronous speed as well as below.

The variability in the power factor of a brush-shifting series commutator motor at once precludes it from successful use in cascade with an induction motor, since the power factor if variable must be under perfect control for all frequencies as in a shunt commutator motor. A fixed brush position is therefore adopted, and the stator is fitted with a special three-phase winding placed with a certain angular space relation to the armature with fixed brushes and connected in series therewith. It becomes possible, therefore, by means of a variable shunt, to vary the excitation, and therefore the flux and voltage of the commutator machine through any desired amount for any current.

Motors of this class are employed to utilise the energy otherwise lost from induction motors controlled by slip regulators in flywheel motor-generator sets by the British Thomson-Houston Co. Another variable-speed commutator motor is that of Schrage, in which an induction motor and cascade-connected shunt commutator motor are combined as one machine.

SURFACE CONDENSERS

A PAPER by Mr. T. R. Houston on "Modern Surface Condensing Plants" was read on Tuesday last before the Rugby Engineering Society. It was well known, remarked the author, that a vacuum of 26 to 27 in. was the utmost that a reciprocating engine could utilise efficiently, as at higher vacua not only must the L.P. cylinder and its ports be of excessive size, but there was risk of considerable condensation in the cylinder. With the steam turbine, however, these limitations disappear, and the efficiency increases of the turbine itself increases rapidly with the vacuum. The economy of the whole plant, however, reaches a maximum at a vacuum depending on the cost of the condensing plant, cost of running, auxiliaries, &c. For cooling water at 60° F. the maximum economy is reached at about 28·6 in., and for cooling water at 80° F. at about 27·3 in. The most essential points in the design of a surface condenser are that the steam should be distributed as evenly as possible over the whole tube surface; the steam velocity should be as constant as possible across the condenser; the drop of pressure across the condenser should be a minimum; the form of shell should be mechanically strong; the air-pump suction should be as far as possible from the steam inlet, and so arranged that "short-circuiting" of the steam between these points is avoided; the design should avoid the possibility of any part of the condenser remaining "air-drowned"; the condenser should be as cheap as possible without unduly sacrificing the foregoing points:

The amount of tube surface necessary for the condensation of a given quantity of steam under given conditions depends on the rate of heat transmission from the steam to the water. This rate is usually expressed as B.Th.U. per hour per square foot of external tube surface per 1° F. mean temperature difference between steam and cooling water, and is then known as the "coefficient of heat transmission." The effect of small quantities of air leaking into the condenser is the most difficult point to allow for in condenser design. Its effect is that the condenser temperature will be lower, and the temperature difference between steam and cooling water therefore less, and the air will hinder the transfer of heat to the tubes by reason of its bad heat-conducting properties. In other words, the air will tend to insulate the tubes.

Air pumps were classified under the following heads:—Reciprocating dry air pumps, reciprocating wet air pumps, steam jet ejectors, rotary air pumps, and water jet ejectors. The last-mentioned is not so well known as the others. A successful example is the Müller air ejector of Willans & Robinson. Water is pumped under pressure through a nozzle, in which is fitted a special cone provided with helical vanes to break up the stream of water and impart to it a swirling motion. The design of this cone plays an important part in the working of the ejector. The water jet issuing from the nozzle entrains the air from the condenser and the aerated jet is ejected into the taper pipe or diffuser, where the air is gradually raised to atmospheric pressure as the velocity energy of the water is given up. The air passes to the nozzle chamber through the non-return valve, which is connected to the air branch on the condenser. In connection with this valve is a vacuum-breaking valve. The

water pressure falls below a pre-determined amount, and there is a possibility of water being drawn into the condenser; this valve will open and admit a rush of air into the ejector and force the flap valve on to its seat. The ejector may be coupled up with a circulating pump of sufficient size to deal with both the circulating and ejector water, or the circulating water may be passed through the ejector and condenser in series. A third arrangement is to provide a separate pump for the ejector.

LIGHTNING AND SURGE ARRESTERS

A PAPER on protective devices against lightning and surges, by Mr. E. Kilburn Scott and Mr. L. F. Fogarty, was read last Friday before a thinly-attended meeting of the London Branch of the Association of Mining Electrical Engineers. The Paper treated the subject generally, not relating in particular to mining installations. After some introductory remarks, several forms of spark-gap arresters were described, including the comb, mica washer, blow-out, and Wurtz or roller types, and various patterns of the horn arrester, mentioning the relay type with an extra pilot gap below that of the main horns. An electromagnetic blow-out was sometimes used to hasten the action. Another device was the provision of movable strips which were attracted towards one another when an excess voltage was reached, and fell away as soon as the spark passed. The aluminium electrolytic arrester was also described briefly. One objection to its use was its liability to reduction in its protective power due to frost. It was, however, largely in use in the United States. For pressures above 5,000 volts, water-jet arresters were used to a certain extent. Passing on to resistance for use in series with spark-gap circuits to limit the energy following the discharge, the authors described the carbondum, carbon dust, liquid, and wire types. Another important part of the equipment was the choke coils to prevent the passage of the discharge to the working circuit. In the Burke arresters this is made to form one of the horns, and in the Gola arrester a choking coil with an iron core is used to reflect the surge, and the extra time thus occupied helps the horns to discharge. Some notes on the establishment of earth connections were also given.

A somewhat different principle was used in the Giles electric valve. A first spark-gap was placed in series with a resistance, and a number of further gaps each indirectly connected to earth by a small condenser, while the last electrode is directly connected to earth. The action of these condensers causes an even distribution of the voltage over the smaller gaps when the main gap has once sparked over. Several of these appliances are used in parallel. It is found that the terminal pressure at the valve sinks very little below that for which the main gap is adjusted, and the sparks cease spontaneously without having recourse to any blow-out arrangement. The valve does not act during the whole period, but only during that time in which the surge tension occurs, and its effect is to cut off from the voltage curve all the peaks which are beyond the value for which the gap is regulated. This is quite different from the horn arrester with its persistent arc, through which a much larger amount of energy passes.

The latter part of the Paper discussed generally some of the various causes of surges, and drew attention to the possibility of serious effects being produced on the end windings of machines, &c., by surges of which the maximum voltage was insufficient to put the arrester into action. It was explained how such voltages could be concentrated over a few turns of an armature winding and puncture the insulation unless specially protected by choking coils. Sometimes the very action of a horn arrester set up the very surges which it was its function to protect against. A system of protection in use to a considerable extent on the Continent was by the application of condensers, particularly those of the Moscicki type. The most usual method of installing these condensers is to insert between the overhead conductors and the machines or plant to be protected a choking coil, and to connect the condenser between the choking coil and earth in such a way that any high-frequency oscillations tending to propagate themselves into the station would be reflected back on to the line and earthed through the condenser. Such condensers are also of considerable use as a protection against surges due to switching, when their method of affording protection can be compared to the relief which would be afforded in an hydraulic system by an air chamber. It is a well-known principle in hydraulics to provide an air chamber for the purpose of preventing phenomena known as water-hammer, where advantage is taken of the cushioning

effect due to the elasticity of air. In a similar way an electrical condenser properly installed provides a means of flattening out the peaks of a transient voltage curve, and in this way affords relief to the system.

POSSIBLE INCREASE IN THE CHARGES FOR ELECTRICITY

THE electricity supply stations in London have escaped the necessity of curtailing supply on account of lack of coal, although one was reduced a week ago to a stock sufficient for only one day's requirements and another to three days', yet the enormous increase in the price is becoming more and more serious. Electricity works, which until a few weeks ago were paying 12s. 6d. per ton for coal suitable to their requirements, are now being asked prices up to 23s. for the same quality, and although this enormous increase is not general, yet prices are steadily advancing, and the shortage of supply is so serious that the works are compelled to buy, and coal merchants have matters their own way. The increased insurance and the longer time required for transit must necessarily raise the cost of sea-borne coal, but it is difficult to see why rail-borne coal should be affected except by the law of supply and demand. The shortage of trucks, owing to the congestion on the railways, is no doubt serious, but neither the actual cost of raising the coal nor its conveyance to London should be greatly increased, and it is obvious that there is a danger of undue profits being taken. We are loth to suggest that the hard-worked Government departments should be worried, but the time has certainly come when pressure might reasonably be brought to bear on them to impose a limit on the price of coal and its transport.

If prices continue to rise, the electricity supply authorities will have no option but to increase the price charged for electricity, and we have reason to believe that some have already in contemplation the necessity of doing this. Cases of a general increase in rates have been rare, and there is very little precedent to go upon, but so long as the price does not exceed the maximum laid down in the supply undertaker's Electric Lighting Order or Special Act, there is nothing to invalidate an immediate increase in rates except when there is a contract with the consumer to supply at definite charges per unit without a "coal clause." It would be very regrettable if this step should have to be taken, but it must not be forgotten that, in addition to the increased generating costs owing to the rise in the price of coal, the supply companies have also to face a decrease in the consumption of electricity due to diminished shop lighting and street lighting, and general economies on the part of the public, so that the establishment charges per unit must necessarily increase. They have also to reckon with the fact that they are contributing to the support of the dependents of the large numbers of their staff on military service, and at the same time have to engage other men to do the work of those who are away. The situation is, in fact, difficult enough without an artificial rise in the cost of rail-borne coal.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

"Magnetism and Electricity," by S. S. Richardson. 598 pp. 7½ in. by 5 in. 260 figures. (London: Blackie & Son, Ltd.) New edition. 4s. 6d.; abroad, 5s.

"Electrical Engineering in India," by J. W. Meares. 517 pp. 8¾ in. by 5¾ in. 74 figures. (Calcutta: Thacker, Spink & Co.; London: W. Thacker & Co.) 15s. net.; abroad. 15s. 9d.

REVIEWS OF BOOKS

Polyphase Currents. By A. Still. 800 pp. 7½ in. by 5 in. 101 figures. (London: Whittaker & Co.) Second edition. 6s. net; abroad, 6s. 6d.

This is a second and revised edition of a book which is too well known to need a special introduction to our readers. The author addresses neither the beginner nor the specialist, but aims at giving the student, already familiar with continuous-current phenomena, a general idea of the principles and applications of alternating and polyphase currents. The

treatment does not call for much knowledge of mathematics, and a special feature of the work is the extensive use of graphical methods, including "clock" and vector diagrams, &c. Neither machine nor switchgear design fall within the range of the book, although there is a great deal of really practical engineering information regarding alternators, transformers, induction and other A.C. motors, rotary converters, &c.

The Electron Theory of Matter. By O. W. Richardson. 612 pp. 8*½* in. by 5*½* in. 58 figures. (Cambridge: The University Press.) 18s. net; abroad, 18s. 9d.

The bearing of the electron theory on a wide range of physical phenomena is reviewed in this work, which is directed towards showing how the fundamental facts on which they depend may be co-ordinated by the modern conceptions of the electron and the latest aspect of electro-dynamics. The author has based his work on lectures given by him at Princeton University, which were intended as an introduction to the more advanced methods of mathematical physics, in addition to presenting some of the results of recent physical discovery. Although the treatment is necessarily somewhat mathematical, the mathematics do not form the chief feature of the book, the great value of which is in how the various facts elucidated by recent research fall in with the general scheme of the electron theory, and how some of our pre-conceived ideas must be modified to realise the consistency obtainable from the new point of view.

The Practical Electrician's Pocket Book for 1915. Edited by H. T. Crewe. 474 pp. 5*½* in. by 3*½* in. 272 figures. (London: S. Rentell & Co., Ltd.) Cloth, 1s. net; by post, 1s. 3d. Rexine, 1s. 6d. net; by post, 1s. 9d.

The contents of this well-known pocket book have been rearranged somewhat in preparing this year's edition. With a view to obtaining improved logical sequence of the subject matter some of the older matter has been omitted or condensed, and entirely new sections appear on the important subjects of Electricity in Coal Mines and Distributing Systems, and on a well-known system of electric clocks. Many other sections have been brought up to date, and the useful feature of a central station directory is retained.

The "Mechanical World" Pocket Diary and Year Book for 1915. 439 pp. 6*½* in. by 4 in. 81 figures. (Manchester: Emmott and Co., Ltd.) 6d. net; by post, 8d.

The 1915 edition has been revised and brought up to date with all the care characterising the many previous editions of this wonderful sixpennyworth. New matter appears on gearing and gear-cutting, structural iron and steel work, and other branches of the subject, and the gas-engine section has been extended. Electrical matters are reserved for the companion volume, the "Mechanical World" Electrical Pocket Book.

"Mechanical World" Electrical Pocket Book for 1915. 6*½* in. by 4*½* in. 130 figures. (Manchester: Emmott & Co., Ltd.) 6d. net; by post, 8d.

This wonderfully complete sixpennyworth grows in size from year to year. In this edition a new section appears on electric circuits and switching, and new matter has been introduced on synchronising and phasing out. The portion dealing with the diagnosis and remedy of defects in generators and motors has been rewritten and additions have been made in the excellent sections on electricity on board ship and in collieries. These and other improvements show how thoroughly the work is kept up to date.

Hazell's Annual for 1915. Edited by T. A. Ingram. 592 pp. 7*½* in. by 5 in. (London: Hazell, Watson & Viney, Ltd.) 3s. 6d. net; abroad, 4s. 2d.

The 1915 edition of this Annual contains a number of special features, among which may be mentioned an interesting account of the meetings of the British Association in Australia last autumn. The war prevented the publication of the usual full accounts in the newspapers here, and it is felt that this special account will to some extent repair the omission. Considerable space, naturally, is devoted to the war, but the usual sections are nevertheless increased in size in many instances. The list of societies now include the American societies.

I.E.E. Associate Membership Examination.—An examination will be held on Friday and Saturday, April 30th and May 1st, at the Examination Hall of the Royal Colleges of Physicians and Surgeons, Queen Square, Bloomsbury, W.C. Should a sufficient number of candidates make application, arrangements will be made for the examination to be held concurrently in local centres. Entry forms, which must be returned not later than March 1st, may be obtained, together with the Examination Regulations, on application to the Secretary of the Institution.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS. A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,429.

When the triple-pole switch of a 20-h.p., 3-phase, 40-cycle, 550-volt motor is put in, the motor frame is "alive" (flashing it to earth gives a very visible spark), but when the rotor starter is moved to the first step, and the motor starts up, the frame ceases to be "alive," and remains "dead" as long as the machine continues to run. When the stator windings are tested with a "megger" the insulation resistance to earth is 15 megohms. What is the cause of this? "ERTH."

(Answers must be received not later than first post Thursday, Feb. 18th.)

ANSWERS TO No. 1,427.

A shunt-wound commutating pole generator, driven by an induction motor, shirks the load when run in parallel with other identical machines, yet deals satisfactorily with the load when run alone. What is the probable cause of this?—SPARK GAP.

The first award (10s.) is given to "M. M.," who writes as follows:—

For direct-current generators to run satisfactorily in parallel, they should have similar characteristics, such characteristics showing a slight falling off in voltage with increased load. Prime movers should give constant speed, though it is not essential that each generator should run at the same speed. Even with otherwise suitable conditions the trouble can easily be accounted for if brushes are in wrong positions. The brushes of the machine shirking its fair share of the load may be in such a position as to give a more drooping characteristic than the others. Give the generator taking the small load a backward lead to its brushes, and increase the lead of brushes on the other machines. Coupled with good shunt regulators, this may meet the difficulty. Although the induction motors driving the generators may be of a similar type, it must not be taken for granted that the "slip" of each increases proportionately with increased load. A slight difference in magnetic leakage or resistance of windings may give a sufficiently drooping speed curve to account for the one machine not taking its share of load when running with others. By itself the difference may be so slight as to escape notice. A speedometer will soon give evidence on this point.

To come back to quite simple matters, the fault may be due to faulty fittings or connections. Suppose, for instance, there are bad contacts at the main switch; "drop" across these contacts will readily account for a machine shirking its share of the load. Quite a small difference in voltage will cause a serious out of balance. The remedy for such a state of affairs is obvious. Generally:—(1) Find out if speed curves of induction motors are similar; this may mean a troublesome matter, and need attention by the makers. (2) See that brushes are in good order and that all switch contacts, &c., are satisfactory; this should give little or no difficulty. (3) Plot a characteristic from each

generator; should these differ, much may be done by altering brush positions and shunt regulation.

The second award (5s.) is made to "E. P. H.," who writes as follows:—

The trouble experienced can be the result of either (1) defects in the motor, or (2) defects in the generator, resulting in poor parallel running.

(1) *Motor Defects.*—(a) The air-gap in the case of this set may be larger than in the case of the others, and, in consequence of the heavier magnetising current, extra heating and drop of speed and consequent load follow. (b) If a slip-ring type of motor, the joints to rotor cables, internal and external, should be examined, and also rotor tested for bad joints, as these are a frequent source of drop of speed.

(2) *Generator Defects* (most probable source of trouble).—(a) Incorrect adjustment of brush positions between machines. (b) The machine in question having commutating poles, although it is nominally a shunt machine, it is quite possible for a compounding effect to be produced by the commodes. The machine may have larger air-gap under its commodes than the others, and in consequence not stand up to load in the same degree. Frequently this can be counteracted by rocking the other machine brushes forward and this one backwards slightly from neutral zone. (c) The brush drops may be larger on this machine, due to rough commutator, high mica, oil on commutator, or defect in armature or balance connections. Eccentricity in field also will produce this, with the consequential drop of load in comparison with good machines. It is quite possible, however, that merely adjustment of brush positions or slight shunting of commodes of other machines will enable perfect parallel running to be obtained.

HEATING OF FIELD COILS

A PAPER by Prof. Magnus Maclean, Mr. D. J. MacKellar, and Mr. R. S. Begg, read on Feb. 9th before the Scottish Local Section of the Institution of Electrical Engineers at Glasgow, described a research into the distribution of temperature rise in field coils. One of the field coils of a motor had a series of thermo-junctions inserted at various depths, and curves were plotted of the rise of temperature at each point in various circumstances. A number of these curves are given in the Paper. It was noted that the ratio of the final rise of temperature to the number of watts is greater for the higher speeds. The following formula is given by Hawkins and Wallis for the rise of temperature of field coils:—

$$\frac{\text{watts}}{\text{area}} \times \frac{a}{1+bv}$$

where a and b are constants, and v =peripheral speed in metres per second. Experiments at a light load give mean values of $a=198.6$ and $b=-0.0263$, and at heavy load $a=232.8$ and $b=0.023$ for these constants.

The L.C.C. Power Scheme.—It is stated that the Parliamentary Agents for the London County Council's Electric Power Bill, which was, as reported in our last issue, rejected at the meeting of the Council on Feb. 2nd, have received instructions not to withdraw the Bill. There is apparently some intention of endeavouring to arrange a special meeting at which the vote on the Bill on the 2nd inst., which was given under somewhat peculiar circumstances, may be reconsidered. Meanwhile, the Parliamentary Committee report that, in addition to Messrs. Merz and McLellan being retained as experts in connection with the Bill, Mr. Robert Hammond has also been retained to conduct negotiations with certain of the authorised distributors concerned in that Bill. This report, however, relates to action taken by the Committee to the end of December, 1914, and is not subsequent to the vote on the 2nd inst.

The Enemy's Trade.—The Advisory Committee of the Board of Trade on Commercial Intelligence continues to receive inquiries for the names of sellers or buyers of articles formerly obtained from German or Austro-Hungarian sources. Special arrangements have been made for dealing with these inquiries, and lists are prepared and circulated of articles which inquirers desire to purchase and to sell. The eighth of these lists is now ready. British firms interested in any of the goods mentioned, either as buyers or sellers, should communicate with the Director of the Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

ELECTRIC TRACTION NOTES

The Board of Trade Report of Col. von Donop into the accident at Barnsley on Dec. 2nd, when a tramcar ran away down a hill, knocked down the wall of a house, and severely injured six passengers, two of whom died. It appears that the car was standing at a terminus on a down grade held only by the rear hand-brake, and the driver had got off and was talking to another driver. The conductor, not noticing that the driver was absent, released his brake and gave the signal to start. He did not notice that anything was wrong until considerable speed had been attained, when he lost his head, failed to make his brake hold, and jumped from the car, leaving the passengers to their fate.

Another runaway tramcar accident, at Devonport, on Nov. 27th, is dealt with in a report by Col. E. Druitt. In this case an overcrowded workmen's car approached a steep down grade at a rather high speed, and the driver was unable to check it in time owing to having skidded his wheels. The car therefore reached a curve at the foot of the hill at a speed sufficient to make it turn over. The Inspector considers that had the car not been so overcrowded, it would probably not have overturned.

A Committee has been appointed, under the chairmanship of Mr. H. F. Parshall, to devise a scheme for payment of interest on the bonds of the Barcelona Traction, Light & Power Co., which is in default. Holders of bonds are recommended to communicate with Mr. Parshall at Salisbury House, London Wall, E.C.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A few further particulars are now available with regard to the New York-San Francisco telephone line, mentioned in our last issue. There are two "physical" circuits, each of 0.165 in. diameter hard-drawn copper wire, and a small length of cable line (less than 10 miles) is included. A phantom circuit is worked. The length of the actual line between the two cities is 3,400 miles, involving the use of 5,920,000 lbs. of wire and 130,000 poles, and £400,000 worth of line material is practically given up to the exclusive use of the three pairs of people who are speaking on the lines at any moment. On some sections, however, superposed telegraph circuits are also in use.

We are informed that the German Patent (No. 210,151) corresponding to British Patent No. 5,547/07 of Siemens Brothers and W. Dieselhorst, for armouring submarine telephone cables containing loading coils by applying in the closing machine a second sheathing over the first in such a manner that the two combine and form a single sheathing over the expanded part containing a coil, has been before the German Patent Court at the instance of a well-known firm of submarine cable manufacturers, who demanded its revocation on the ground of anticipations; but the decision was that these were not substantiated, and the patent was upheld in all its claims.

A good deal of progress has been made with the construction of the high-power Marconi stations for direct communication between Norway and the United States. The American stations, of which some details are given in the *Wireless World*, are the most advanced. The receiving station is at Chatham, Cape Cod, Massachusetts, and the transmitting station at Marion, forty miles distant. The directional aerials are about $1\frac{1}{2}$ miles in length, and a balancing aerial at Chatham screens this station from interference from Marion, so that duplex working can be adopted. The main aerials are supported on 14 steel tube masts each 423 ft. high. Power will be taken from public service mains. The Norwegian receiving station will be on the Udlanheng Hill overlooking the Stavungen firth, and the transmitting station at Nærbo, 26 miles distant, will derive power from a local water power system. The equipment will be similar to that of the American station.

An interesting account of the researches which Prof. E. W. Merchant has been conducting into the conditions affecting the variations in the strength of wireless signals was included in a Paper read by him on Tuesday at a meeting of the Manchester Local Section of the Institution of Electrical

Engineers held at Liverpool University. Most of the measurements made were between Liverpool and Paris, which lie mutually almost north-west and south-east; a few results are also recorded in connection with the Goldschmidt station near Brussels, which was destroyed. A crystal detector was used at Liverpool, and the current received by the antenna was estimated from the current flowing in the crystal circuit after the various constants of the circuit had been determined. Both a Broca and a Einthoven galvanometer were used to produce the records. The observations are discussed in some detail in the Paper, and the results are summarised as follows:—That between two stations lying nearly north-west and south-east of each other the strength of signals during the daytime varies within comparatively narrow limits. That the ratio between the night and day strength varies with the time of the year, and also from day to day in any given month. That on a fine clear day the "sunset effect" occurs about three-quarters of an hour after the actual time of sunset, and varies with the weather conditions. When rainy

conditions prevail, the strengthening of the signal after sunset is much less marked. That the amount of the sunset effect varies with the direction in which signals are emitted. That there is very little evidence that between two stations, such as Liverpool and Paris, where the difference in longitude is about 22 minutes, there is anything in the nature of a dense fog which is opaque to waves, and which causes a drop in signal strength when the dark-light band lies between the two stations. The variations during the night are relatively great, and occur within the space of a few minutes. The greatest increases in strength of signals have been observed after the cessation of rain either at the sending or receiving station. That the character and extent of the variations in signal strength point to the conclusion that the main factor which controls the variations is the state of ionisation of the atmosphere, and that it seems likely that clouds of ionised air may exist in the upper regions of the atmosphere which act as mirrors for the waves and cause the sudden changes in signal strength that have been observed.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Feb. 4th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

28,838/13. Telephone Repeater. W. H. DERRIMAN (*Automatic Enunciator Co.*). A telephone repeater, comprising an electromagnet and a differential or other microphone with a direct rigid connection between the armature of the electromagnet and the movable electrode of the microphone. Various adjustments are provided, and a special vibration insulating material separates the electromagnet from the supporting structure of the microphone. (Six figures.)

590/14. Resistances. G. MASCARINI and A. CONTARDI. Resistance containing sulphide of iron or similar materials have a high negative temperature coefficient, and according to this invention are applied to the rotor resistances of induction motors giving automatically the required decrease of resistance as they warm up. The resistance can be made very compact and be embodied in the rotor, so that only an internal short-circuiting switch but no slip-rings are required. (Three figures.)

1,341/14. Combined Starting Motor and Lighting Dynamo. A. H. MIDGELEY and C. A. VANDERVELL. This machine has separate commutators and armature windings for use in its two functions and the field windings, which as a self-regulating dynamo leave half the poles unexcited, are regrouped to give the full number of poles when working as a motor. (Two figures.)

5,456/14. Metal Filament Lamps. B.T.-H. Co. (*G.E. Co., U.S.A.*). Gas-filled metal filament lamps with short filaments, such as automobile lamps, with the filament of thinner section at the point where the cooling effect is greatest, i.e., near the supports. (Four figures.)

7,145/14. Heaters. O. C. HAWKES. Heating elements for "fires" composed of wire wound on fireclay bases with an outer fireclay or steatite fretted tube or cover close enough to the wire for the whole to be brought to a luminous glow. (Five figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: BERRY [Supply system] 26,495/13; ROWLEY and SANRAINÉ SYNDICATE, LTD. [Insulating material] 1,133/14.

DYNAMOS, MOTORS AND TRANSFORMERS: GRAEMIGER [Motors for driving enclosed machines] 8,700/14.

Electrometallurgy and Electrochemistry: DIXON [Electric furnaces] 4,742/14.

Heating and Cooking: WEAVING and FERRANTI, LTD. [Liquid heaters] 28,932/13.

Ignition: MACNAB [Ignition and starting system] 29,216/13; MASON [Magnetics] 21,774/14; WADE (*Mason*). [Magnetics] 23,142/14.

Storage Batteries: GIFFINS and WATSON [Charging and discharging] 2,174/14.

Switchgear, Fuses and Fittings: COLLIE [Switches] 2,242/14.

Telephony and Telegraphy: WESTERN ELECTRIC CO. (*Wood-*

ward for W.E. Co., U.S.A.) [Telephone desk sets] 2,215/14; BELULANDER [Automatic telephone] 18,154/14; WOODLAND [Wireless Telegraphy] 18,711/14.

Traction: VANDERVELL and MIDGELEY [Car lighting] 27,615/13; DOYLE [Electromagnetic train stop] 10,742/14.

Miscellaneous: LUCAS and EDWARDS [Electric horns] 2,380/14; DARRAS [Condensers] 14,834/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

SIEMENS SCHUCKERTWERKE GES. [Safety devices or vacuum relays for electric circuits] 722/15.

Amendment Made

16,380/14. Wireless Telegraphy. R. GALLETTI. Leave has been granted to amend this specification by the addition of the name of Galletti's Wireless Telegraph and Telephone Co., as one of the applicants. (This specification has not yet been published.)

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

3,047/01. Boosters. J. S. HIGHFIELD. A hand-regulated reversible battery booster for maintaining constant output of the generating plant with two field windings, one regulated by a reversing rheostat with a single handle, and the other connected in shunt with the main current, and regulated by resistance controlled as required by a single handle.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: S. C. MOUNT and BECK FLAME LAMP, LTD. [Flame arc lamps] 22,454/08.

DYNAMOS, MOTORS AND TRANSFORMERS: E. A. CAROLAN (*G.E. Co., U.S.A.*) [Rotors for turbo-alternators] 22,909/03; MORGAN CRUCIBLE CO. and C. W. SPIERS [Graphite and metal composition brushes] 22,659/04; B.T.-H. CO. (*G.E. Co., U.S.A.*) [Windings for two-speed induction motor] 22,821/04, [Motor control] 21,290/05 and [Rotary converter field windings] 24,126/09; SIEMENS BROTHERS & CO., LTD. (*Siemens-Schuckert*) [Frequency changers] 24,269/09.

Electrochemistry and Electrometallurgy: M. BAUM [Deposition of platinum] 22,455/08.

Heating and Cooking: G. G. BELL [Electric oven] 23,819/09.

Ignition: VEREINIGTE MASCHINENFABRIK AUGSBURG & MASCHINENBAU GES. NÜRNBERG A.G. [Gas engine ignition] 7,733/04.

Incandescent Lamps: C. O. BASTIAN and G. CALVERT [Sealing in wires] 21,383/05.

Instruments and Meters: H. S. HATFIELD [Electrolytic meters] 22,920/06.

Switchgear, Fuses and Fittings: W. P. THOMPSON (*Schwaige & Co.*) [Time switches] 23,427/06.

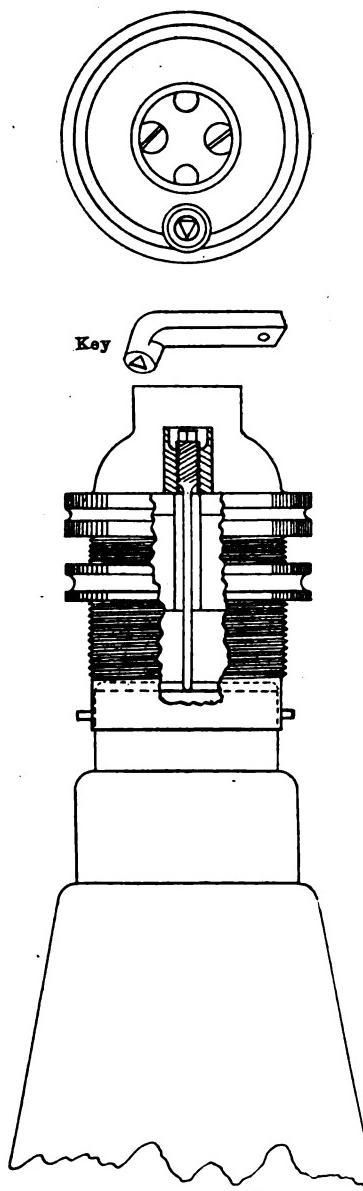

Telephony and Telegraphy: I. B. BIRNBAUM (*Tel. Fabrik A.G. vorm. J. Berliner*) [Private branch exchange working] 23,309/06.

TRACTION: F. W. LE TALL (*G. Westinghouse*) [Electro-pneumatic controller] 22,829/02; SIEMENS & HALSKE A.G. [Points and signalling] 23,533/09.

Miscellaneous: H. MANDERS [Arc high frequency apparatus] 24,134/09.

"ELECTRICAL ENGINEERING" TRADE SECTION

A LOCKING LAMPHOLDER

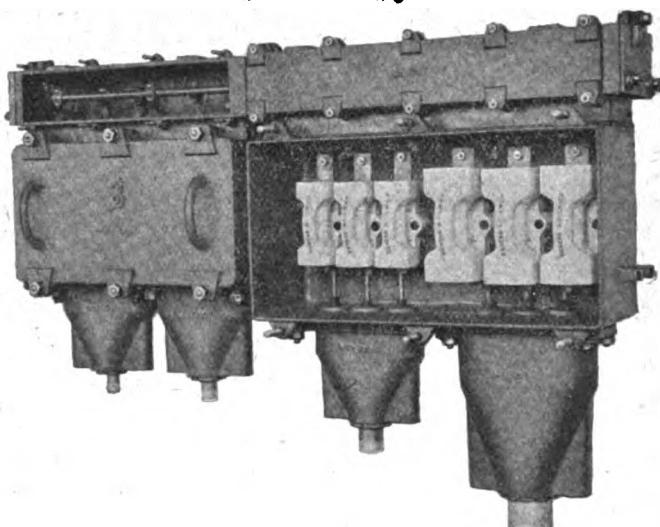

PLAN AND SECTIONAL ELEVATION
OF LOCKING LAMPHOLDER.

by using a light stamped collar resting on the shoulder of the lamp to carry the shade, and locking it by screwing down the shade-ring on the top of the shade (see ELECTRICAL ENGINEERING, Oct. 26th, 1911, p. 585). Another is an ingenious locking trigger applicable to all-porcelain battenholders of a particular type. Many of our readers know from sad experience how necessary it is to lock lamps in installations of a certain class, and will appreciate a simple means of doing so. The device is provisionally protected under the patent application of Messrs. C. M. Bennett and C. H. Jeffcoat, and all inquiries should be sent to the latter at 18 Ranelagh Gardens, Hammersmith, W.

IRONCLAD DISTRIBUTION BOARDS

We give here an illustration of a special design of ironclad distribution board which Siemens Brothers & Co., Ltd. (Woolwich), have recently put on the market for power distribution purposes in large works, where it is becoming general practice to use ordinary multicore lead-covered paper-insulated cables for motor and other circuits. These boards are designed with detachable trifurcating boxes, which can

be fitted either above or below the board. Each main fuse-box is arranged for two three-phase circuits, and forms with its bus-bar chamber and dividing boxes a complete unit. The bus-bar chamber ends are covered with plates, the special feature of this arrangement being that additional sections

IRONCLAD DISTRIBUTION BOARDS FOR 3-CORE CABLES.

can be added to either end, and extensions made at any time. The bus-bars are of copper tube, and are also easily extended. The fuses are of the Home Office porcelain shrouded type, and liberally designed for contact area. Details of these fuses are shown in the firm's catalogue No. 521, which will be sent on application.

A MISTAKE-PROOF STAR-DELTA STARTER

An improved pattern of mistake-proof star delta starter has been introduced by the General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.). It consists of a central drum carrying sectors and

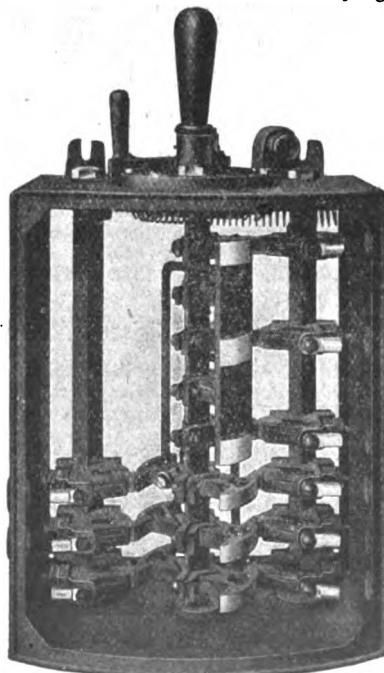

FIG. 1.—STAR-DELTA STARTER WITH COVER REMOVED.

rotating between two fixed sets of contacts. A mistake-proof device is provided, which prevents the handle being thrown right over into the running position, and so causing damage to the motor. Nothing but mica insulation is used throughout, and the stationary contacts are of the G.E.C. special self-

aligning adjustable solid copper block type (registered design No. 628,113). Every part is thoroughly accessible, and the cable connections in a simple manner, without bunching together of the cables. Each enters through a bush directly

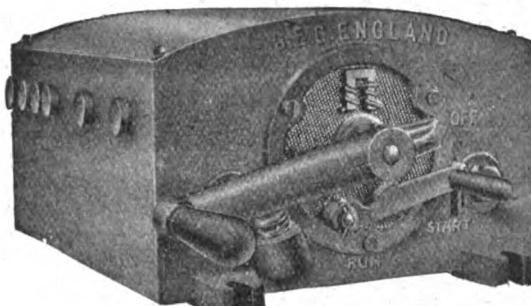

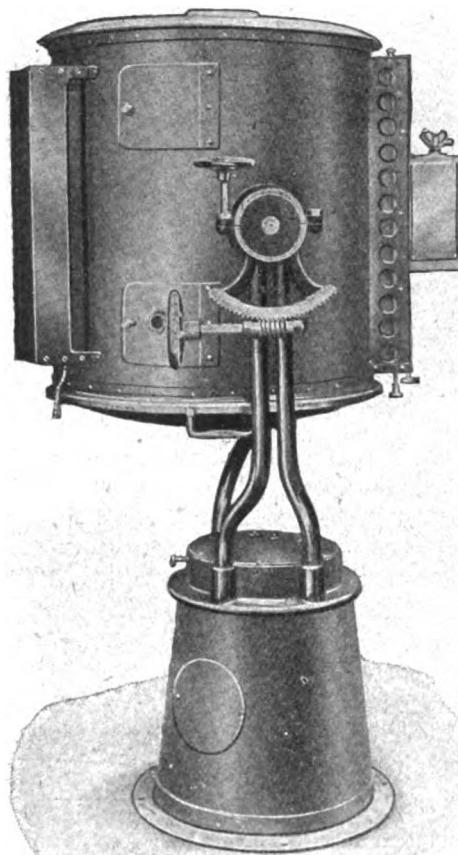

FIG. 2.—TOP SHOWING CATCH WHICH PREVENTS SWITCHING STRAIGHT INTO THE RUNNING POSITION.

opposite its sweating thimble, the cables from the motor entering on one side of the starter, and from the line on the other side. The design illustrated is suitable for 40 h.p. at 500 volts. Inasmuch as the starter completely isolates the motor in the off position, no other switch is necessary.

SEARCHLIGHTS

WE illustrate here a new pattern of searchlight projector which has been added to the numerous types that are being manufactured by the London Electric Firm (George Street, Croydon). This is a 24-inch projector, with silvered parabolic mirror mounted to give the utmost possible angular

SEARCHLIGHT PROJECTOR TILTED TO GIVE A VERTICAL BEAM.

movement, and revolving on ball bearings. A conveniently arranged quadrant and brake is provided for elevation. A new pattern of lamp is used with combined automatic and hand feed, arranged so that the carbons can be adjusted by hand while still working automatically without any change whatever. The lamp will work through a resistance on any voltage from 80 upwards

THE MOST VALUABLE WORK FOR ELECTRICIANS

By RANKIN KENNEDY, C.E.

The coupon below entitles any reader of ELECTRICAL ENGINEERING to a complimentary copy of a booklet describing what is probably the most valuable work for electricians ever published. The necessity for electrical engineers being well acquainted with all designs for installations that have given good results will be readily acknowledged by those whom the matter concerns.

While there are numerous text-books dealing with one branch or another of electrical engineering, they are all prepared for the student, and their contents deal rather with theory than with practice.

The aim of the new Edition of "ELECTRICAL INSTALLATIONS" which has just been published is to assist the practical man who is concerned with electrical installations in any form, and this because it is recognised that there exists a very large class engaged in constructive and installation work, and a still larger class whose duty it is to take care of the machinery employed in working by electricity. Most of these men have picked up a working knowledge of their employment. What they need is to study the elements of the science of the subject. These elements are fully dealt with, and on the sound foundation thus laid, the author, who is a civil and electrical engineer by profession, and recognised as being in the front rank of electricians and engineers, proceeds to deal with every possible form of electrical installation, their principles and practical application.

ALL BRANCHES DEALT WITH.

The work includes in its comprehensive scope a review of electrical instruments, with references to indicators and recorders, and alternating wattmeters, electric pyrometers, and an electric spark recorder—all of supreme importance to electricians and electrical engineers. The heavy branch of electrical engineering, dynamos, motors, alternators, transformers, are, needless to say, given in great detail and with profuse illustrations. A section is devoted to the electric ignition and electric illumination on motor-cars. Herein will be found up-to-date information on magnetos for ignition and "constant current at variable speed," and dynamo electric generators.

Dual ignition systems are fully dealt with, so, too, are "electrical installation accessories," wiring switches, switchboards, regulators, electrical signals, telegraphs, telephones, and wireless telegraphy.

Electrical appliances in workshops, factories and steamships are now more numerous, and are daily becoming more commonly in use in every department of commercial industry; hence it is more and more necessary that mechanics, fitters, plumbers, engineers-in-charge, marine engineers and others should have an intelligent knowledge of the subjects given in this work—a knowledge which, added to his trade training, makes a man valuable far beyond the mere tradesman.

A FREE BOOKLET

To the CAXTON PUBLISHING CO., LTD.,

97, Surrey Street, London, W.C.

Please send me, free of charge, and without any obligation on my part, Illustrated Booklet on the Book of ELECTRICAL INSTALLATIONS and particulars of your plan whereby the volumes are delivered for a first payment of 1s. 6d., the balance being paid in small monthly instalments.

ADDRESS

BEUTELL LIGHTING

IN our last issue we referred briefly to the catalogue of fittings for concealed lighting, shop-window lighting, &c., which have been brought out by Messrs. A. W. Beutell, Ltd. (Army and Navy Mansions, Victoria Street, S.W.). We have now had an opportunity of inspecting these, and have been much interested in the practical design and the large number of useful applications for these fittings. It was to Mr. A. W. Beutell that the invention of "linolite" was due, many years ago, and it is the tubular lamp in its latest and improved form, with metal filament, that is employed in the majority of the fittings in question. Reflection and

30 and 60 watt 200- to 250-volt lamps of the same overall dimensions ($1\frac{1}{8}$ in. diameter) are also supplied. The holders for the lamps are of porcelain, mounted on the reflector, with spring plunger contacts, and by an ingenious design of the terminal block the wire is simply clamped in without any screws.

Fig. 1 shows one of the most useful forms of reflector. It will be noticed that it is corrugated at an angle of 45° with the lamp tube, and the depth and arrangement of the corrugations has been carefully calculated so that streaks, representing multiple images of the lamp filament, are entirely absent. In this case the reflector is of silvered glass, and is carried by a wood moulding; it is suitable for shop-

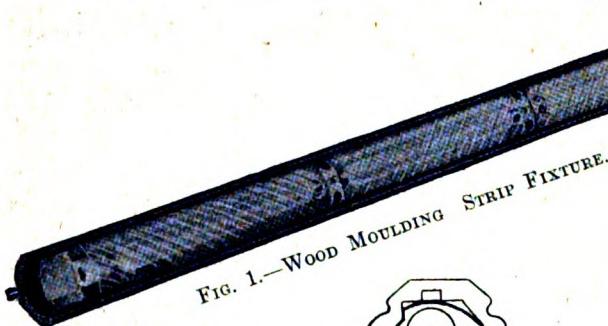

FIG. 1.—WOOD MOULDING STRIP FIXTURE.

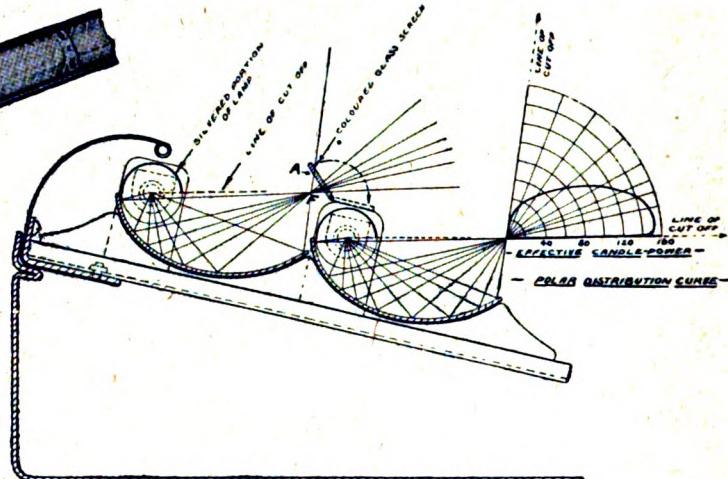

FIG. 3.—DIAGRAM OF FOOTLIGHT ARRANGEMENT.

FIG. 5.—NEW DINING-ROOM FITTING.

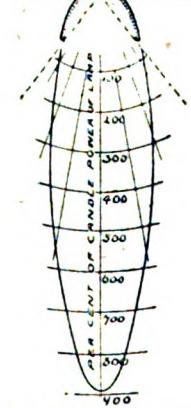

FIG. 2.—POLAR CURVE OF FIG. 1.

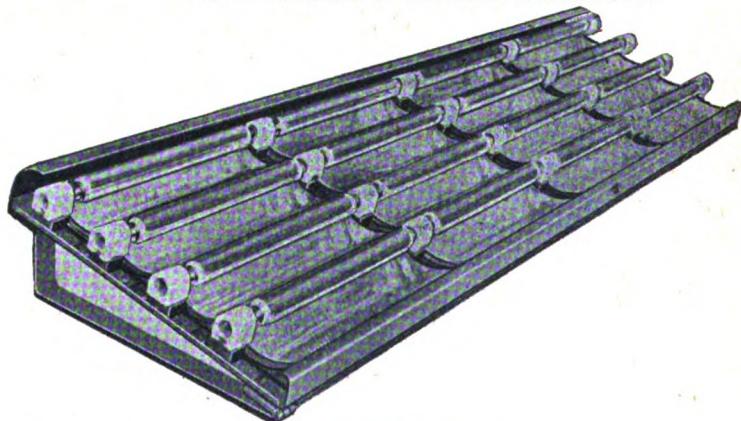

FIG. 4.—FOOTLIGHTS.

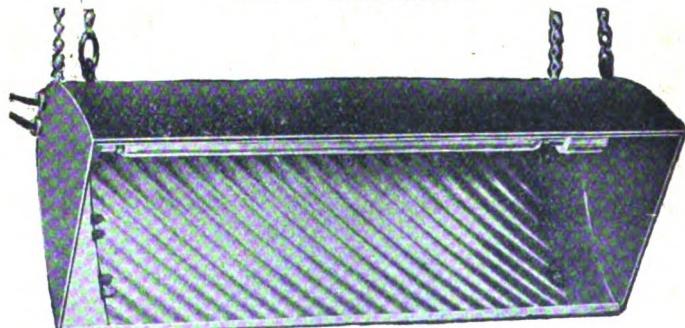

FIG. 7.—OUTSIDE SHOP WINDOW FIXTURE.

focussing of the light of an ordinary lamp is not possible with absolute accuracy owing to the large amount of space occupied by the filament and its irregular shape, but when the source of light is practically a straight line, as in the tubular lamp, the conditions are very different. It has thus been possible to construct a range of reflectors for various purposes to give the light exactly in the direction required, and with the maximum efficiency of illumination.

A standard length of lamp, 12 in. between centres, is employed. The 50-volt lamps (in wattages from 10 to 60) have a practically straight filament, and are used in series, when the length of the reflector can be somewhat over 2 ft. on a 100-volt circuit or 4 ft. on a 200-volt circuit, but the same wattages are available in 100- to 130-volt lamps; and

windows and concealed lighting generally. The polar curve of illumination is seen in Fig. 2, which shows that $5\frac{1}{2}$ times the rated candle-power of the lamp is sent in the direction required. Fig. 7 is a reflector designed for illuminating shallow or high shop-windows from outside; and Fig. 6 gives the light distribution which is actually equivalent to nine times the rated candle-power of the lamp in the direction desired. There are many other patterns. It may be mentioned that, with these improvements, it is claimed that good shop-window illumination can be obtained with only one 60-watt lamp for every 3 foot length instead of the customary one 60-watt lamp per ft.

For some fittings a corrugated glass screen is employed in front of the strip to break up the striations of the light.

We were shown a 300-watt $\frac{1}{2}$ -watt lamp fitted in an approximately parabolic mirror, with one of these screens in front, which gives a beam of nearly 40,000 c.p.

Fig. 4 illustrates a cleverly designed arrangement for foot-lights, which should give a large economy in current compared with the ordinary arrangement. The four rows of tubular lamps have their upper halves silvered, and the light is projected on to a silvered glass reflector of special contour. Fig. 3 shows the arrangement diagrammatically with the polar distribution curve of the light projected on the stage, assuming that 30-watt lamps are employed. The removal of the focus *F* by the reflectors to a point well away from the light source avoids interference between the lines of lamps. Colour effects are produced by hinged screens *A* (shown in Fig. 3 only) instead of by coloured lamps.

The lamps for this fitting, and for other cases in which excessive vibration is expected, have their filaments divided into two lengths, connected by a specially-shaped triple-elliptical spring, and they withstand an extraordinary amount of knocking about.

Fig. 5 is a new departure in dining-room fittings. When pulled down over the table, the lamp comes in the lower part of the double conical reflector, and the light is reflected in the ordinary way on the table. On pushing the fitting up, however, the lamp itself is made to travel up faster than the fitting—by means of a cord absorber—and comes in the upper part of the reflector, so that the lighting becomes semi-indirect for the general lighting of the room. Part of the silk shade is lifted in Fig. 5 to show the form of the reflector.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Boroughbridge.—Messrs. H. Best and W. E. Pullan, of Bradford, are forming a company to carry out an electric lighting scheme for this district.

Bootle.—A twelve months' supply of V.B. wires and cables, lead-covered cables, meters, fuse-boxes, service boxes, and lamps is required. Borough Electrical Engineer. Feb. 17th.

Canada.—The Canadian Electrical Association requires a twelve months' supply of electrical wire, meters, and incandescent lamps. 10, Adelaide Street E., Toronto. Feb. 27th. European firms having no authorised representatives in Canada may cable their prices and other particulars in advance of the date mentioned. Further particulars at 73, Basinghall Street, E.C.

Dewsbury.—An extension of the generating plant is under consideration.

Gillingham.—A loan of £6,750 has been sanctioned for mains and services.

London: Battersea.—Meters and other stores (see advertisement).

Hammersmith.—Twelve months' supply of meters, cable joint and fuse-boxes, and electric light sundries. Borough Electrical Engineer. Feb. 24th.

Manchester.—Six superheaters for the Stuart Street Generating Station. Chief Electrical Engineer. Feb. 22nd.

Redditch.—A L.G.B. inquiry was held last week concerning a loan of £28,000 in lieu of £18,000 originally proposed for electrical extensions. The necessity for increasing the amount of the loan is due to an agreement which has been entered into with the Birmingham Small Arms Co. for a supply up to 2,000,000 units per annum.

Walthamstow.—A L.G.B. inquiry has been held concerning a loan of £15,144 for electrical extensions.

Worcester.—A L.G.B. inquiry was held last week concerning a loan of £5,250 for mains, transformer and sub-station equipment. During the course of the inquiry, Mr. H. R. Hooper, the Inspector, complained that the Corporation had

been again spending money on capital account without sanction. There had, he said, been previous experience of this at Worcester, and a promise had been made that the Corporation would not overspend again. The inquiry also included sums of £1,973 and £850 for the electricity undertaking, but eventually it was adjourned for the Inspector to be furnished with certain particulars.

Wiring

Aberdare.—Wiring and fitting of new police court. Clerk of Works. Feb. 19th.

Barnsley.—Town hall.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Burnley.—School.

Dunfermline.—School.

Finchley.—Hospital for Finchley and Hendon (£50,000).

Loughborough.—Fire station (£5,000).

Oldham.—Theatre. Imperial Theatre Co.

Miscellaneous

Bedwas.—The Bedwas Navigation Colliery Co. requires a twelve months' supply of electrical stores. Secretary.

Maclesfield.—A twelve months' supply of electrical stores for the Cheshire County Asylum. March 10th.

Salford.—Twelve months' supply of metal and carbon filament lamps for the Tramways Department. General Manager. Feb. 22nd.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Eastbourne.—Mr. J. K. Brydges, the Borough Electrical Engineer, has recommended the purchase of a 1,250-kw. Ljungstrom turbo-alternator and condensing plant from the Brush Electrical Engineering Co. at £5,085. The Electricity Committee recommends that the resolution of the Council to purchase a 500-kw. set at £3,200 be rescinded. There was some opposition to the extra expenditure involved, and eventually the matter was sent back to the Committee for further consideration.

London: L.C.C.—Contracts have been placed with the Edison & Swan United Electric Light Co. for drawn wire metal filament lamps under Items 8 to 27 of Schedule 17.

Orient Steam Navigation Co.—A contract has been placed with the Edison & Swan United Electric Light Co. for a 12 months' supply of "Royal Ediswan" lamps.

Winchester.—A contract has been placed with Messrs. C. A. Parsons & Co. for a 500-kw. D.C. turbo-generator at £2,691.

York.—Overhead material for $1\frac{1}{4}$ miles of tramway is to be obtained from Tramway Supplies, Ltd., of Leeds. The poles will be supplied by Messrs. J. Russell & Co., of Wednesbury.

A contract for Osram lamps has been placed with the General Electric Co. by the Bibby line of steamers. The contract is for an exceedingly large quantity of lamps, and was placed after exhaustive tests.

A Trade Misunderstanding.—Mr. E. C. Seear, trading as Seear, Page & Co., 16 and 17 Devonshire Square, E.C., recently sued the General Accessories Co., Ltd. (70 Worship Street, E.C.), before Judge Cluer in the Shoreditch County Court, to recover £26 12s. 11d. for 100 gross of wooden blocks for electric light fittings. The defendants claimed that the price (according to the terms of a circular, should have included finished blocks, whereas unfinished blocks were supplied, as the circular did not expressly say unfinished. Plaintiffs contended that defendants could have known that the price, 5s. 3d. per gross, could only refer to unfinished blocks, as the finished were usually sold at 7s. to 7s. 6d. per gross. Again, it was the custom to deliver unfinished blocks in bags and finished blocks in boxes. Finally the judge decided in favour of the defendants, who were justified in assuming finished blocks unless unfinished were definitely quoted.

Shooting Match.—A shooting match was held at the private miniature range of Siemens Brothers' Dynamo Works, Ltd., Dalston, on Thursday last, between a team representing the firm's lamp works and some representatives of the Press. The result was a win for the Siemens team with ten highest scores aggregating 860 and two others of 51 and 35. The ten highest scores of the Pressmen totalled 738, four others being 47, 46, 45, and 43 respectively.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Flash Lamp Refills.—A correspondent wishes to know the name of the makers of "Franco" and "Standard" flash lamp refills. We shall be glad if other makers of dry batteries for pocket lamps will also communicate with us, as one of our subscribers has orders to place for large quantities.

Bankruptcy.—J. W. Tattersall and T. W. Tattersall, trading as electrical engineers at Kimberley Road, Willesden Lane, N.W., have been adjudicated bankrupts. The first meeting of creditors will be held to-morrow (Friday) at Bankruptcy Buildings, Carey Street, W.C., at 12 noon, and the public examination will take place at the same address on March 16th at 11 a.m.

Agencies.—A manufacturer's agent, already representing several British firms in Russia, is now in the United Kingdom, and wishes to secure the representation in Russia of British manufacturers of electric lamps and fittings.—A Wellington (N.Z.) firm desires to secure the representation of British makers of filament lamps.—A Sydney firm desires to represent British makers of arc lamp carbons, conduits, and electrical accessories. Further particulars in each case at 78 Basinghall Street, E.C.

APPOINTMENTS AND PERSONAL NOTES

The salary of Mr. H. Webber, the Borough Electrical Engineer at Keighley, has been increased from £325 to £400 per annum. In addition, Mr. Webber has a separate salary of £100 per annum as Tramways Manager. There was some opposition, but it was pointed out that the Electricity Committee having previously passed the vote, Mr. Webber had withdrawn his application for another post which he had virtually secured.

Mr. S. W. Carty, Overhead Superintendent to the Liverpool Corporation Tramways, has been given a commission as 2nd Lieutenant in the Army Service Corps, and the Corporation is keeping his position open until his return.

LOCAL NOTES

Batley: Generating Plant Commandeered.—The Brush Electrical Engineering Co. has informed the Corporation that a Ljungstrom turbo-alternator and condenser recently passed for erection at the Corporation electricity works, has been taken over by the Admiralty for an important naval base. The Brush Co. also mentioned that a similar set for the Kensington & Notting Hill Company's joint station in London and a rotary-converter for Kettering have been taken over in the same way. It is understood that these are required for emergency power houses which are being erected to diminish the chance of dockyard work being interfered with through damage to existing stations by hostile aircraft or otherwise. The Company now ask the Corporation to extend the time for the completion of the contract by four or five months. The Town Clerk has been requested to approach the Admiralty on the matter.

London: Marylebone: *Thefts by Meter Clerk.*—A meter clerk named C. Walker has been sentenced to five months' imprisonment for a series of thefts of jewellery and other articles from premises which he visited on the plea of having been sent to make repairs.

Westminster: *Street Lighting Contracts.*—Interesting correspondence has taken place between the Council and the Companies supplying Westminster with lighting in relation to a request that the contract charges should be reduced owing to the reduced lighting which has been enforced by the authori-

ties. The Westminster Electric Supply Corporation points out that it is worse off owing to the darkened streets, as although there was the small saving of about £100 on the current consumed up to Dec. 31st, £666 more had been paid for carbons. Although 123 lamps were out of use no current was saved on this account as it was absorbed in the resistances necessary to keep the other lamps of the series going, the carbons only being saved. The dimming of 224 lamps saved only 15 per cent. of the current which otherwise would be used, the capital charges on maintenance continuing. The Charing Cross, West End, & City Co. is also not disposed to make a reduction for similar reasons.

Ormskirk: *Gas Co.'s Proposal.*—The Ormskirk Gas Co. has a Bill in Parliament this session under which it proposes to acquire the Ormskirk Electric Light Company's undertaking by agreement. The latter Company acquired the Council's Provisional Order of 1910 a short time ago, and is now giving a supply. The Council, however, has indicated its opposition to the scheme.

Wigan: *A German Contract.*—The Electric Lighting Committee has rescinded the acceptance of a tender for switchgear and transformers, it having been discovered that although the capital of the Company concerned was £50,000 only £530 was English money. An English Company has accepted the contract at the price quoted by the German firm.

Yorkshire: *Power Co.'s Bill.*—A conference of local authorities affected by the Yorkshire Electric Power Company's Bill was held at Wakefield last week. The general view of the representatives was that the Company, in return for the authority it asks to supply electricity in those districts in its area where at present there is no supply, should be compelled to prescribe a compulsory area for each particular district. The Company is not prepared to acquiesce in this, but at the same time it is willing to cut out of the Bill any authority desiring to be so treated. There are 84 councils affected, and up to now 33 support the Bill. The County Council has decided to oppose.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Dividends of London Electric Supply Companies.—Westminster Electric Supply Corporation, 8 per cent. per annum for December half year, making 9 per cent. for the year; St. James's and Pall Mall Electric Light Co., final dividend of 5s. per share, making total of 10 per cent. for the year. Central Electric Supply Co., 5 per cent. on the ordinary shares for 1914. Smithfield Markets Electric Supply Co., 2 per cent. on the ordinary shares. South London Electric Supply Corporation, 5 per cent. for the year. London Electric Supply Corporation, 4 per cent. for 1914, placing £12,000 to sinking fund; £10,000 to reserve, £7,000 to contingencies, and carrying forward £8,828.

Arrangements for the Week.—(To-day) *Thursday, Feb. 11th.*—Institution of Electrical Engineers. "Conditions Affecting the Variations in Strength of Wireless Signals," by Prof. E. W. Marchant. 8 p.m.

Friday, Feb. 12th.—Physical Society of London, Imperial College of Science, South Kensington. "On the Criterion of Steel suitable for Permanent Magnets," by Prof. S. P. Thompson, F.R.S. 8 p.m.

Saturday, Feb. 13th.—Birmingham and District Electric Club, Swan Hotel, New Street. "Electric Heating and Cooking Compared with Older Methods," by R. Weaving. 7.30 p.m.

Monday, Feb. 15th.—Institution of Electrical Engineers, Newcastle Section. Mining Institute. Discussion on "Wiring." 7.30 p.m.

Institution of Post Office Electrical Engineers, at I.E.E., Victoria Embankment. "Wireless Call Devices," by L. B. Turner. 6 p.m.

Tuesday, Feb. 16th.—Illuminating Engineering Society, at Royal Society of Arts. "The Development and Design of Lighting Fixtures in Relation to Architecture and Interior Decorations," by F. W. Thorpe. 8 p.m.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

SUMMARY

THIRTY-EIGHT petitions have already been presented against the Electric Power Bill which is being promoted by the London companies. The chief and assistant engineers of all the municipal undertakings in the area have also petitioned (p. 67).

A NUMBER of interesting points on the construction and working of ignition magnetos were raised in a Paper by Mr. J. F. Henderson and discussed at the last meeting of the Institution of Automobile Engineers (p. 68).

WE give some details of the three-phase rack locomotives which are used for towing ships through the Panama Canal locks (p. 69).

STANDARDS for automobile lamps of the tungsten filament vacuum type have been issued by the Engineering Standards Committee (p. 69).

EXPERIMENTS by the staff of the National Physical Laboratory on the heating of buried cables are being carried out on several supply systems under the auspices of the Research Committee of the Institution of Electrical Engineers (p. 69).

A FURTHER list of 140 members of the Institution of Electrical Engineers on Military Service has been issued, bringing the total to 733 (p. 70).

SEVERAL technical books are reviewed on p. 70.

THE effect of change of frequency on the accuracy of alternating-current motors is discussed in our Questions and Answers columns (p. 71).

AMONG the specifications published last Thursday at the Patent Office is one for an arrangement of heating

circuits for preventing a pre-determined load from being exceeded, and a motor with enclosed rotor and open stator. Application has been made for the suspension of an enemy-owned patent for an electrometer used in Röntgen-ray work. An early Marconi patent and one of the Gray tautograph patents expire this week, after a full life of fourteen years (p. 72).

PROF. MARCHANT's paper on the conditions affecting the strength of wireless signals was discussed last Thursday at the London meeting of the Institution of Electrical Engineers. Notes are given under "Telephony and Telegraphy" on the progress in the equipment of automatic telephone exchanges by the Post Office and on the effect of the bombardment on the West Hartlepool telephone exchange (p. 73).

THE L.C.C. are abandoning the side-slot system which had been adopted experimentally (p. 73).

ARTICLES in our Trade Section deal with a boiler feed regulator, a sub-station equipment, a detachable fan, a watertight-door indicator, a rope-operated controller, and an extensible fitting (pp. 74-75).

EXTENSIONS are contemplated at Cleckheaton (£20,000); a 500-kw. turbo-generator is required at Perth; a recommendation to spend £11,000 at Grimsby has been referred back; and various stores are required at Bolton, Bradford, Manchester, West Ham, Belfast, &c. (p. 77).

THE charges for electricity at Wednesbury are to be increased, and there is a prospect of similar action at Dublin (p. 78).

THE South Metropolitan Gas Co., whose own coal steamers were taken over by the Government, have been compelled to pay the present market freight rates to the Government for the use of the interned steamers (p. 78).

OWING to the war, the Yorkshire Electric Power Co. does not feel justified in paying a dividend on the ordinary shares for the second half of 1914 (p. 78).

(For Arrangements for the Week see p. 77.)

The London Electric Power Bills.—Although, as stated in our last issue, there was a slight prospect of the L.C.C. endeavouring to reconsider the vote which resulted in the rejection of its Electric Power Bill, this idea is not being persevered with, and the Bill has now been definitely withdrawn from Parliament.

The second Bill relating to London, viz., that promoted by the Companies, is down for reading on Monday next, but it is probable that it will again be postponed. In the meantime, no less than 38 petitions have already been deposited against the measure, including two on behalf of the Chief and Chief Assistant Electrical Engineers respectively of local authorities supplying electricity in the area scheduled whose undertakings may be acquired under Clause 61 of the Bill.

MAGNETO IGNITION

A PAPER on this subject by Mr. J. F. Henderson was discussed at a meeting of the Institution of Automobile Engineers on Wednesday, Feb. 10th. After a discussion of the elementary principles involved, the author said that the magnets were usually made from tungsten steel hardened by a special process, making them very hard but not necessarily glass-hard. Magnets for this purpose are larger than the bulk of magnets made for instruments, and are much more difficult to harden uniformly, while they must be as powerful as possible while being reasonably permanent, so that even a different steel may be found more suitable for them than for instrument magnets, in which permanence is the first consideration. It was the practice of the author's firm to age magnets for a fortnight before testing to get rid of the sub-permanent magnetisation. A good magnet should give about 200 lines per cubic centimetre. Thus a magnet 32·4 cm. by 4·5 cm. by 1 cm. gave a total flux of 30,000 lines. An interesting point in relation to the permanence of these magnets in use is the fact that by arranging the circuit to be closed only during those parts of the revolution when the current in the armature produces a field assisting the main field, the magnets are being constantly reinforced, and actually tend to become stronger rather than weaker. This was originally pointed out by Mr. B. Murray in 1899 and in the last form of the Bosch contact-breaker, arrangements have been adopted for keeping the contact during two opposite quadrants of the revolution for this reason. Another point, connected with the distortion of the field due to armature reaction, was noticed a few years ago by Mr. Murray, who found that if the trailing tip of the pole piece were made bevelled instead of parallel to the axis of the armature, it had the effect of making the field rotate against, instead of with, the direction of the rotation of the armature, so making the point of maximum current earlier instead of later as the speed of the armature increased. In the Bosch magnetos this result has been attained by using a pole piece of a peculiar shape. Their first arrangement was to make the edge of this pole piece with projecting teeth. As is well known, it is necessary to advance the ignition lever as the speed of the engine increases. The reason for this lies mainly in the lapse of time between the moment at which the points of the contact-breaker are drawn apart and the moment at which the pressure in the cylinders attains its maximum. This becomes a larger proportion of the stroke as the speed increases. The author investigated the effect of the self-induction of the armature on the growth of the current, and showed that it built up quicker the higher the speed. The spark is, however, wanted earlier at high speeds, and if it were not for the fact that the lag of the current gets less at high speed, there would always be a weaker spark as the speed increases. This is a very important result, and it is this which really makes high-speed magnetos possible.

The "high-tension" magneto consists essentially of a low-tension magneto and an induction coil. The primary and secondary are usually both wound together on the armature, the primary being the main armature winding itself. The voltage produced in the secondary, due to its rotating in the magnetic field, is, however, not very great in proportion to the final voltage produced, but in any case it is in the same direction. It was shown mathematically that the discharge from the secondary or ignition circuit is oscillatory in character, and that the more rapid the discharge, the higher is the energy developed, and therefore the temperature of the spark. The resistance and capacity must be kept small to give the greatest number of oscillations, but the capacity must be kept large to get as much heat as possible, so that the resistance must be kept small and the self-induction large. Oscillatory discharges, especially when the frequency is high, have a curious property in that they will jump a spark gap even when there is considerable leakage between the two sides of it, and so, probably, have an advantage for ignition purposes, as a spark would be produced even though the plugs were so dirty as to cause considerable leakage.

The maximum voltage that the magneto can produce will depend on the length of the spark gap at the plug and the pressure of the gas in the cylinder. For a certain length of spark gap the spark will take place at a certain definite voltage, which will be higher as the gap is increased. The spark voltages in ordinary air were given in a table. For example, a 0·02 cm. gap requires 1,150 volts, a 0·1 cm. gap 4,360 volts, and a 0·5 cm. gap 16,800 volts. Under compression the voltage rises almost in direct proportion to the pressure. This produces rather a curious result. With a given plug, the higher the pressure in the cylinder, the better the spark will be, provided the magneto is powerful

enough to make a spark at all. The reason of this is that the voltage will rise higher before the spark takes place, and the work done by the spark is as the square of the voltage. Thus the points of the plug should be kept as far apart as possible to get the best spark.

The connections of a typical magneto system were shown, and the function of the condenser in preventing a harmful spark at the contact-maker was explained. When the condenser is connected up, the current rushes into it and charges it up instead of being wasted in making a spark. The condenser then discharges itself, and produces a current in the opposite direction, round the primary, helping the reverse field. This effect approximately doubles the voltage produced. The secondary of the Bosch magneto is earthed through the primary. This is an unusual arrangement, and in most induction coils it is earthed separately. Another feature to which attention was directed was the safety gap which protected the magneto against excessive voltage should the plugs be disconnected.

There are a large number of variables in the design of a magneto. Assuming the magnets to give 120,000 lines, and allowing a leakage coefficient of 1·3, there will be 108,000 lines through the armature. If the core is increased and the magnets reduced to give the same total induction through the armature, the same voltage would result, but there would be a greater self-induction. This would give a higher voltage when the current is broken, but the lines would build up more slowly in the core, and if the core be increased still further, a point would be reached at which the lines would build up so slowly that there would be no further advantage. Similarly, the more turns put on the primary, the less current will pass, and a point will be reached which will give the maximum ampere turns, which is what is required. Similar considerations affect the secondary. The more turns the higher the voltage, but the resistance and capacity are also increased, which would make the passage of the spark slower. It is necessary, therefore, to find the number of turns which will give the maximum spark. To those who are thinking of manufacturing magnetos, the author said that the importance of the patents affecting them was practically nil. The most important of the Bosch patents applied simply to small details. The question of insulating materials was, however, serious, as most of the best of them came from Germany, though there was no reason why they should not be made in this country.

The discussion was opened by Mr. Young (British Thomson-Houston Co.), who pointed out that permanent magnets were being produced in this country which were the equal of any which had been produced in Germany. He did think that Mr. Henderson's estimate of 120,000 for the total plug of a magneto, which was presumably equivalent to the Bosch Z 24 size, was correct, as with the cross-section of 12 sq. cm. that would give a flux density of 10,000 lines, whereas the actual flux density was about 5,000. Again, he thought that Mr. Henderson's method of defining the goodness of a permanent magnet as 200 lines per cubic centimetre was misleading, as magnets of different length would upset the comparison. It was better to refer to the flux density in the magnet itself. The real point of importance in choosing magnet steel was to see that the coercive force was greater than a certain critical value. He was inclined to doubt that in any circumstances a strengthening of the magnet when in use, and in any case the weight-lifting test, was not a good criterion. He showed an interesting series of oscillograms made by the B.T.-H. Co. The machine tested was a small single-cylinder bicycle magneto, and gave a total flux of 31,000 lines, or, allowing 20 per cent. leakage, a flux density of 5,200. He showed curves giving the variation of self-induction for different positions of the armature, and the current in the primary at different speeds, from which it was seen how the peak was led forward as the speed increased. It was the value of the current at the breaking-point that determined the voltage in the secondary. Owing to self-induction and capacity effects, the voltage in the secondary was much higher than that given by multiplying the primary voltage by the ratio of the turns. It reached 10,000 volts even for very low speeds. Sir Robert Hadfield said a few words on magnet steels, observing that it was remarkable that the addition of tungsten not only made a good magnet steel, but gave a steel of less electrical resistance than the addition of any other element. There was no question that we could make as good tungsten steel here as abroad. English experimenters have studied the effect of heat treatment of these alloys in great detail, and the question of magnet steel was now engaging the attention of a special committee of the Institution of Electrical Engineers. Mr. Watson dwelt on the desirability of formulating a standard test for magnetos. He thought that the most important things to test were the voltage which the magneto would give at low speed and the output in joules at the sparking plug. He thought that oscillographs on the H.T. side were not much use as the current was so small.

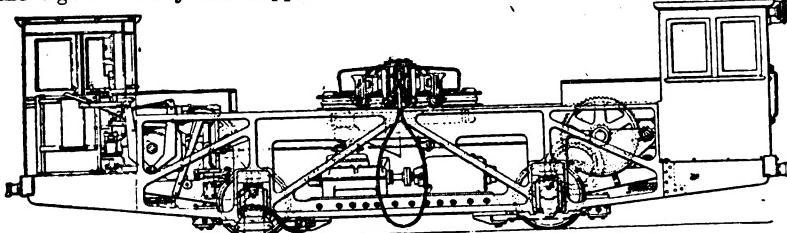

With an electrostatic voltmeter and a very quick-acting contact-maker, he had measured secondary voltages up to 10,000 volts. His measurements showed voltages very nearly in proportion to the turns in the primary and secondary; and he did not quite agree with Mr. Young on that point. He measured the energy output by discharging across a small gap into a large condenser discharging through a resistance and watching the voltage. Mr. Clinker said that Mr. Young's test indicated that 70 to 75 per cent. of the energy stored up in the short-circuited winding was given out by the spark. This had been measured by calorimeter tests. The voltage of a magneto was not proportional to the speed as the curve bent over owing to increasing effect of eddy currents as the speed arose. He did not think that Mr. Henderson's method of testing and measuring the length of the spark was much use. The quality of the "fat" spark that was required was better measured by Mr. Watson's method or by the calorimeter.

Mr. Henderson replied briefly to some of the points raised.

TOWING LOCOMOTIVES ON THE PANAMA CANAL

ONE of the features of special interest in the working of the traffic of the Panama Canal is the use of electric locomotives for towing ships through the locks. At the Gatun locks, for example, the two ship channels, one for traffic in each direction, are separated by a centre wall, and on this wall and on the outer walls are towing tracks fitted with racks as well as tracks for the return of the locomotives. These tracks are for the most part level, but at certain points there are steep inclines, some as steep as 44 per cent., at portions corresponding to the lock-gates. The return tracks are provided with racks on these inclines only, with spring-hinged ramps at their ends. A further feature of the rack-rail is the projecting edges which permit thrust-wheels attached to the locomotive to run along the under side and prevent the overturning of the locomotive, in case some unforeseen operating condition should produce an excessive pull on the tow-line. These thrust-wheels serve to counteract the lateral component of the tow-line pull and the flanges act for emergency only, as the weight of the locomotive is sufficient to prevent overturning with the normal pull of 25,000 lb. on the tow-line. The general system of towing is to have two locomotives on each side ahead of the vessel and two keeping their hawsers tight astern, so that the position of the ship can be regulated to a nicety by the winding drums with which each locomotive is provided.

The principal features of the locomotives can be seen from the figure. They are supplied with current at 220 volts,

SECTIONAL ELEVATION OF TOWING LOCOMOTIVE WITH SIDE COVERS REMOVED.

three-phase, 25 cycles by a double-contact plough in a slotted conduit and the running rails. Each locomotive has two driving axles each driven by its own three-phase slip-ring motor. The wheel-base is 12 ft., and the overall length 32 ft. The drive to the live axle of the adhesion wheels is through two intermediate shafts. The pinion for driving on the rack sections is carried on a sleeve on the axle and driven through another gear from the last gear shaft of greater reduction. These gears are put in action alternatively by sliding sleeve positive clutches of special design, with a spring arrangement enabling them to engage at the right moment automatically without special attention on the part of the driver. Controllers are provided at both ends, and either motor can be cut out if desired.

On each motor shaft is a powerful brake, and as the motors are at all times geared either to the axles or to the rack pinions, the track wheels are not provided with any brake. These brakes are controlled by solenoids, when no current is on the weight of the plunger acting through appropriate levers keeps the brake on; but when the motors are supplied with current, the solenoid holds up the arm and releases the brake. There is, however, a controller stop, on which the brake is released without putting current on the motors for coasting. The brakes can also be applied by

hand to any graduated extent, whether the solenoid is in action or not.

Each of the two main traction motors has a rating of 75 h.p., and is of the slip-ring induction type, operated by a system of contactors with a master controller in each cab. The motors, by means of the change in gearing from straight traction to rack-rail towing previously described, drive the locomotive at a speed of two miles per hour when towing and five miles per hour when returning idle. These motors act as induction generators running above synchronous speed when the locomotive is passing down the steep inclines, and thereby exert a retarding brake effect to keep the speed uniform. The vertical shaft winding drum in the centre of the locomotive is seen in the figure with its pivoted cable-guiding device. The drum can either be driven fairly quickly for coiling-in purposes by a special motor working through bevel gearing, but another motor is also provided for slow running while exerting the maximum pull on the rope, and this works through a worm gear. The bevel-gear motor is always left in gear, but a clutch between the worm gear and the drum enables the other motor to be disconnected during coiling in. The drum is driven through a clutch constructed to slip when a certain pull is exceeded. These motors are each of 20 h.p., and are of the squirrel-cage type. The slow-hauling motor can haul in at 12 ft. per minute, and can take care of sudden pulls on the tow-line up to 40,000 lb., although its normal pull is 25,000 lb. The rapid coiling motor gives a rope speed of 200 ft. per minute.

Each locomotive weighs 86,000 lb. Forty of this type have been supplied by the General Electric of America, and we are indebted for these details to the Company's publication, the *General Electric Review*.

STANDARD AUTOMOBILE LAMPS

A REPORT on British standard tungsten filament lamps (vacuum type) for automobiles has been published by the Engineering Standards Committee. The standardisation of these lamps was undertaken at the request of the Society of Motor Manufacturers and Traders, and a special Sub-Committee took the matter in hand. Lamps of the "vacuum" type with an approximate efficiency of one watt per c.p. only are treated, but it is intended to increase the scope of the report to include the gas-filled lamp of higher efficiency which was recently introduced. The question of whether such lamps should be rated at all in c.p. is receiving the attention of the Committee, and in the meantime they are rated by "actual watts or nominal candle-power." Standard bulbs for head, side, tail, dash, dome, and "festoon" lights are defined, and the standard voltages are given as 6 and 12 volts. The form of the filament is not specified, but for headlights a standard distance of 30 mm. from the contact plates to the centre of the filament is prescribed. The standard small bayonet double-contact cap is to be used for all head, side, tail, and dash lights, and special caps are described for dome and festoon lamps. The headlights range up to 48 c.p. The report (No. 69) can be obtained for 2s. 6d. net.

THE HEATING OF BURIED CABLES

A FURTHER report has been issued by the National Physical Laboratory on the experiments with regard to the heating of buried cables which are being conducted under the auspices of the Research Committee of the Institution of Electrical Engineers. At Bristol, tests have been carried out with cables ranging from 0'05 to 0'3 sq. in. laid direct in the ground, subjected specially to constant loads. The conductor resistance was measured by a bridge method, superimposing on the main alternating current a small continuous current for this purpose. An accuracy of measurement of the order of 0'1 per cent. was attained, but the current could not be kept constant to nearer than one per cent. Determinations were also made of the amount of moisture in the soil at the actual depth at which the cables were laid and of the temperature of the soil. Tests on special loads were also made at Wolverhampton on 0'5 and 0'75 sq. in. cables, one in a duct and the other solid in bitumen. Tests under normal conditions of load have also been made at Marylebone on 2 sq. in. cable carrying about 2,400 amperes for about 14 hours a day, and a special modification of the Callendar temperature recorder is in use on tests at Marylebone with a

number of 1 sq. in. cables in a 20-way duct, and a Wolverhampton with cables laid solid and cables drawn into 4- or 6-way ducts. The full programme of tests has had to be slightly curtailed owing to absence of some of the staff of the N.P.L. on active service.

ELECTRICAL MEN ON MILITARY SERVICE

THE second list of members of the Institution of Electrical Engineers on Military Service has just been issued, and includes 140 names, bringing the total to 733. The first list was published in our issue of Jan. 21st. It must not be assumed that all those on the second list have only just joined; the list includes many with regard to whom the Institution had not yet received particulars when the first list was issued. We give the second list in full below. In the case of members who were in the regular Army or Navy before the war, their rank is given before their name, in other cases after.—

MEMBERS.

A. J. Beckett (2nd Lieut.), W. Casson (Capt.), S. V. Clire-hugh (Corpl.), C. W. Davy (Lieut.-Col.), A. Eden (Lieut.), P. D. Ionides (Lieut.), Admiral Sir H. B. Jackson, K.C.B., K.C.V.O., F.R.S., J. Lustgarten, F. L. McKeever (102nd Regt. Canadian Force), R. K. Morcom (Lieut.), J. J. F. O'Shaughnessy (Major), H. Richardson (Capt.), E. M. Sellon (Lieut., 13th Batt. Canadian Force), C. H. R. Thorn (Capt.), G. R. Webb (Lieut.-Col., 1st G.I.P. Railway Volunteers).

ASSOCIATE MEMBERS.

A. R. Alderson (2nd Lieut.), A. J. Anido, E. G. Anness, H. D. Ash (Lance-Corp.), L. Barber (United Provinces Horse), S. P. Barnes (Lance-Corpl.), L. Barney (1st Class Air Mechanic and Observer, R.N. Air Service), C. R. Bland (Corpl., Calcutta Light Horse), H. W. Bosworth (Anti-Aircraft Corps), H. E. Britton, A. W. Brydon (Lieut.), E. V. Buchanan (Capt., Canadian Engineers), B. E. Bumpus (Bombay Volunteer Rifles), W. Burton, L. S. Challis (Capt.), F. J. Culligan (Calcutta Scottish Volunteers), Eng. Lieut. Commander L. W. Curgenven, R.N., L. H. C. Dermer (Lance-Sergt.), H. Dobell (Lieut.), M. I. W. Ellis (2nd Lieut.), T. Ellis (Lieut.), Capt. A. C. Fuller, R.E., B. C. Gardiner (Capt. Royal Marine Light Infantry), C. L. Goolding, J. Hammersley-Heenan (McGill University Battalion), D. Harrop (Sergt.), H. F. Haworth (2nd Lieut.), J. N. Hindle, C. H. Hird, R. P. Hulton, J. R. Kingston (Lieut.), W. C. C. Langdon, A. B. Layton (Capt.), R. C. Leslie, A. F. Lord (Lieut.), E. M. Marvin (2nd Lieut.), P. T. Maybury (2nd Lieut.), C. N. Moberly (Capt. and Adj't., Bombay Volunteer Rifles), H. E. O'Brien (Capt.), J. H. Palmer (Qmr.-Sergt.), L. S. Payne (Sub.-Lieut.), A. W. Puttick (2nd Lieut., Bombay Volunteer Rifles), A. H. Read, T. E. Robertson (2nd Lieut., Royal Flying Corps, Military Wing), L. G. F. Routledge, R. Shaw, B. H. Smith (Qmr.-Sergt.), W. E. Sotheby, (Motor Driver, British Red Cross), R. J. Spencer-Phillips (Anti-Aircraft Corps), H. D. Stanier (Sergt.), E. J. Stevens (Capt.), H. W. Stovold (Capt.), C. F. D. Suggate (Lieut.), W. Sutcliffe (Lieut.), C. Wade (Motor Driver, British Red Cross), T. S. Wallis, A. G. Watson (2nd Corpl.), G. W. Williamson (2nd Lieut.), C. S. Wolstenholme (Lieut.), E. R. Wynne.

ASSOCIATES.

C. F. Clapham, E. M. Hughman (2nd Lieut. 42nd Deoli Regt., Indian Army), A. B. Robertson (Major), Major N. S. H. Sutwell, R.A., A. M. Wilson, M.D. (Major, Union of South Africa Defence Force, Medical Section).

GRADUATES.

H. I. Booth, W. S. Bracher (Lieut., R.A.M.C.), P. H. Chesterton (1st Calcutta Volunteer Rifles), B. Dees (Capt.), B. Leggett, W. G. McLean (Calcutta Scottish Volunteers), W. G. Stokes, P. A. E. Warburton (New Zealand Engineers), E. M. Wolf.

STUDENTS.

S. G. Anderson (2nd Lieut.), A. Bailey (2nd Lieut.), H. G. Baker, E. Barlow, L. W. E. Baxendell, H. E. Bellamy (Corpl.), H. D. Bennett (Lieut.), P. S. Brett, N. B. Bunt, G. M. Burnand (2nd Lieut.), A. E. W. Butler (2nd Lieut.), E. L. Chadwick, C. S. Coombs, G. F. Davies, F. C. W. Dixon, T. A. F. Dixon, J. W. Elliott (Sergt.), M. O. F. England, William Gilbert, G. Haigh (Lance-Corpl.), F. H. Hayward, J. A. B. Hellaby (2nd Lieut.), C. J. Hews (2nd Corpl.), C. G. Lovegrove, L. A. McDougald (Radiographer, French Red Cross), R. W. Macklin (2nd Lieut.), D. R. McWhinnie (Sergt.), C. E. Maguire, R. Marx (2nd Lieut.), C. W. Miller (Lance-Corpl.), N. H. Miller (Corpl.), L. E. Mold (Lance-Corpl.), A. H. Ogden, H. E. Park, C. F. Partridge (2nd Lieut.), C. E. Penn (Calcutta Port Defence Volunteers, Naval Division), A. E. Power (Lieut.), A. Priestley, W. A. Reeves (Lance-Corpl.), H. P. Richardson, H. Riley (Sergt.), T. H. Solomon, D. C. Stern (2nd Lieut.), H. J. Stone, M. Wadeson (2nd Lieut.), E. H. Webb, L. B. Whitaker (Cossipore Artillery Volunteers), J. G. W. Winn (Lieut.), G. N. L. Woodley (Lieut.), A. W. Wouldham, P. Wrigley.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

Papers set in the Qualifying Examination for the Mechanical Sciences Tripos, 1906-1913: 90 pp. 7½ in. by 5 in. 46 figures. (Cambridge: The University Press.) 2s. net; by post, 2s. 2d.

Practical Engineer Electrical Pocket-book and Diary for 1915. 620 pp. 5½ in. by 3½ in. 173 figures. (London: Technical Publishing Co., Ltd.) Cloth, 1s. net; by post, 1s. 3d. Peltine, 1s. 6d. net; by post, 1s. 9d.

Dynamometers. By Rev. F. J. Jervis-Smith, F.R.S.; edited and amplified by C. V. Boys, F.R.S. 267 pp. 9 in. by 5¾ in. 119 figures. (London: Constable and Co., Ltd.) 14s. net; abroad, 14s. 8d.

Alternating-current Electricity and its Applications to Industry. First Course. By W. H. Timbie and H. H. Higbie. 534 pp. 7¼ in. by 5½ in. 389 figures. (New York: John Wiley & Sons; London: Chapman & Hall, Ltd.) 8s. 6d. net; abroad, 9s. 2d.

"Consumers' Accounts and Meter Department Routine." By A. C. Glover. 49 pp. 8½ in. by 5½ in. (London: Electrical Press, Ltd.) 5s. net; abroad, 5s. 3d.

REVIEWS OF BOOKS

High Power Gas Engines. By H. Dubbel. Translated, Edited, and Expanded by F. Weinreb. 206 pp. 11 in. by 7½ in. 428 figures and 18 plates. (London: Constable & Co., Ltd.) 18s. net; abroad, 19s.

Mr. Dubbel's original German work dealt only with large-size double-acting engines, such as have been developed very largely in Germany; but the work before us is more than a translation, as it has been "edited and expanded" by Mr. Weinreb "so as to include British engines and British practice." It is thus a thoroughly suitable book for British gas-engine designers and students, embodying the results of long German experience, as well as the trend of the further advances made in this country. The translator remarks in his Preface that the large gas engine was the outcome of continental enterprise (but we believe we are correct in saying that the real pioneering work was done in France and Belgium, rather than Germany), and continues that the earlier designs were characterised by the prevalence of complicated valve gears mainly influenced by theoretical considerations. The later designs show a compromise between the desire to obtain the theoretical advantage and a tendency towards simplicity. It cannot be denied, he writes, that the latter development is due to the influence of British designers. The work is of a very practical nature, and much of value lies in the very fine collection of detailed drawings of complete gas engines and typical parts.

A School Electricity. By C. J. L. Wagstaff. 250 pp. 9 in. by 5½ in. 181 figures. (Cambridge: The University Press.) 5s. net; abroad, 6s. 5d.

In many ways the writing of an elementary book on electricity is a task requiring more skill than the production of an advanced specialised treatise, and, taken all round, the author has acquitted himself extremely well. His work is the outcome of experience in teaching electricity to schoolboys, and he shows no little originality in the way he presents his subject, casting aside the old "pith-ball" methods and treating electro-statics last instead of first. The whole treatment is based on experimental illustration, and some of the apparatus described is of wonderful simplicity and ingenuity. Each chapter concludes with a series of questions and problems, which appear to be admirably chosen and of a kind to stimulate thought rather than, as is too often the case, mere learning of the text-book by heart.

"Practical Engineer" Electrical Pocket Book and Diary for 1915. 620 pp. 5½ in. by 3½ in. 173 figs. (London: Technical Publishing Co., Ltd.) Cloth, 1s. net; by post, 1s. 3d. Peltine, 1s. 6d. net; by post, 1s. 9d.

A considerable range is covered by this conveniently arranged pocket book, and the additional matter to be found in this year's edition deals mainly with motors, fuses, and wireless telegraphy. A special feature is the section on laws and official rules relating to electrical engineering matters, and at the end of each section there is a short list of books dealing with the part of the subject in question. The information throughout is practical and concise.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS. A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,430.

Three rotary converters are run from a six-phase alternator, and are started up through low-voltage tappings. Resistances are inserted in these tappings, and have been burnt out in one rotary. Can this rotary be started up across high-voltage tappings, and if possible, what precautions are necessary in running up? The rotaries have A.C. voltmeters and ammeters on each panel. The alternator is excited by a shunt-wound exciter on the end of the shaft, and the voltage in the alternator is regulated by resistance in the exciter field, and may be further reduced by resistance inserted between the exciter and the rotor of the alternator. The other two rotaries can be shut down whilst running up.—"ROTARY."

(Replies must be received not later than first post, Thursday, Feb. 23rd.)

ANSWERS TO No. 1,428.

A 200-volt, single phase, 10-amp., 41·5 period meter is fixed to register the consumption of a double wire 200-100-volt transformer. As the supply is 200 volts, 83 periods, how will this affect the reading?—J. M.

The first award is given to "OHM" for the following reply:—

Expressed briefly, it is desired to know just what error will result when a 10-amp. 200-volt single-phase induction meter, calibrated for 41·5 cycles per sec., is used on a circuit of twice this frequency, namely, 83 cycles per sec. As the meter is apparently used to measure the energy consumption of a transformer, the current and power factor are likely to vary over very wide limits. As a general rule, a large change in the frequency (even an increase of as much as 100 per cent., such as we are considering) will not appreciably affect the accuracy of a well-designed induction meter over a range of current load between full load and 5 per cent. of full load, provided the power factor is practically unity the whole time. If anything, the meter would register slightly less than it should do on the higher frequency, but the error should not be more than 1½ per cent. over the range of current load considered, if the meter be one of repute. For power factors less than unity, considerable errors will result which will gradually increase in magnitude as the power factor is diminished. In general, an induction meter, when used on a circuit having a higher frequency than that for which it has been calibrated, will register more than it should do on power factors less than unity, providing the current is a lagging one, as is usually the case in practice. This error arises from the fact that on the higher frequency the potential flux penetrating the rotating disc will be "overlagged"; that is, the disc current due to this flux will be brought more nearly into phase with the series flux, so that the resultant torque (and therefore the speed of the disc) will be greater than it should be.

If C =line current, V =line voltage, and $\cos \theta$ =power factor (lagging), then speed of disc= $KCV \cos \theta$, when meter is used in a circuit having a frequency of 41·5 cycles per sec. When used on an 83-cycle circuit we get: speed of disc=

$KCV \cos (\theta - \phi)$, where ϕ =change in phase displacement of potential flux due to increase in frequency. It would probably be of the order of 30°.

On a power factor of 0·5, the error might possibly be as much as 10 per cent., and even for the best-designed meters it would certainly not be less than 5 per cent. The error would be approximately the same at all current loads. For power factors less than 0·5, such as would obtain when the transformer was running light, the error would be greatly enhanced, although it should be noted that under these conditions the actual energy consumption is very small, so that the larger percentage error does not represent a great deal when expressed as £ s. d. The practice of using a meter in the manner suggested is to be greatly deprecated, unless the "lagging" adjustment is properly altered before using the meter on the higher frequency. This adjustment can be easily and quickly carried out on most well known induction meters, and should in every case be made before changing a meter from one frequency to another, unless the frequency change is not greater than, say, 15 per cent.

The second award (5s.) is made to "V. B." who writes as follows:—

It is a matter for experiment rather than theory to say with any certainty what the effect will be on changing over an induction meter to a circuit of 100 per cent. higher frequency than it was originally intended for, as a great deal depends on whether it is an early or late design, although in practice it is generally found that induction meters register on the slow side, with a large rise in frequency. The early design of induction meter was very susceptible to the wave-form of the alternator, and increasing the frequency will cause a preponderance of the harmonic in the resultant wave, which will cause the meter to read slow. The higher the proportion of the harmonic to the fundamental wave, the slower the meter reads.

The effect on the meter disc can be explained by the following:—At the initial testing of the meter the fluxes produced in the disc by the interaction of the shunt and series coils are displaced by an angle equal to the phase displacement of the current and pressure in the supply mains. As the frequency increases the phase displacement becomes larger, until at high frequencies the flux produced in the disc by the pressure coil lags more and more behind the flux produced by the current coil, and produces a negative torque which will oppose the main torque.

It is quite possible that the meter will test out about 8 per cent. slow or thereabouts, or the 100 per cent. increase of frequency. During the last few years meter manufacturers have produced almost the ideal meter, and claim for it accuracy within B.O.T. limit over very wide variation of frequency, and it might happen that on testing out this particular meter on its new frequency that it is within the 2½ per cent. limit on the slow side.

ANSWER TO CORRESPONDENT

G. R. D.—You will probably be able to obtain a copy of the paper in question from the Secretary of the Institution of Mechanical Engineers, Storey's Gate, St. James's Park, S.W.

The Electric Vehicle Committee.—At a meeting of this committee on February 5th, it was decided to offer, through the Commercial Motor Users' Association, prizes aggregating £10, to be awarded to electric vehicle drivers in the examinations for drivers which the Association is arranging to hold this year. An offer from the Commercial Motor Users' Association to provide space in the next edition of their "Handbook of Night Shelter Accommodation for Commercial Vehicles," particulars of electric vehicle charging stations and a map, conditional upon the Electric Vehicle Committee preparing the matter, was accepted. As to the standard charging station sign, replies to a circular indicated that about 25 of the illuminated signs and 46 of the enamel plate signs would be required by various undertakings. It was left to the secretary to appoint an official manufacturer of these signs. The Council of the I.M.E.A. has requested the Committee to prepare a report on "The Use of Electric Vehicles in Municipal Service" for discussion at the Convention on June 17th, and to arrange for a parade and demonstration of electric vehicles to follow upon the discussion of the report. The standardisation of lamps for electric vehicles was also discussed.

Western Section of the Institution of Electrical Engineers.—At a special meeting on Tuesday, Feb. 23rd, at 5 p.m., at the South Wales Institute of Engineers, Park Place, Cardiff, at which Sir John Snell will be present, the chairman's address will be given by Mr. D. E. Roberts, and a Paper by C. P. Sparks on "Electricity applied to Mining" will be read. An informal dinner will follow the meeting.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Feb. 11th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

26,495/13. Control of Heating Circuits. A. F. BERRY. An arrangement of distributing circuits in premises where a number of heating circuits are used, with the switches controlling each circuit so interlocked that only a number of circuits corresponding to a load less than a predetermined maximum can be on at the same time, although they can be interchanged freely so long as the maximum load is not exceeded. In a modification of the system, all current in excess of a predetermined value can be passed through a separate meter. (Three figures.)

1,133/14. Insulating Material. F. ROWLEY and SANRAINE SYNDICATE, LTD. Electrical and heat-insulating materials made from silk cotton, such as "kapok."

2,174/14. Battery Regulator. A. V. GIFFINS and H. S. WATSON. Automatic regulator for maintaining a constant bus-bar voltage by cutting end cells in and out without altering the number of cells in circuit with the charging dynamo, actuated by solenoids and a ratchet arrangement. (Two figures.)

2,242/14. Dimming Switch. J. H. COLLIE. A three-position tumbler switch with a resistance in the base arranged to put the resistance in series with a lamp, cut the resistance out, or open the circuit. (One figure.)

4,414/14. Resistances. H. COOCH. A variable resistance for motor starters and other purposes in which a liquid or powdered resistance passes from one part of its containing vessel to another, after the manner of the sand in an hourglass. (Two figures.)

8,700/14. Motors. B. GRAEMIGER. Motors for driving enclosed machines in which the use of a stuffing box is avoided by enclosing the starter in a cylindrical case of thin magnetic material of high resistance and great strength, such as a special alloy steel, the walls of which are in the air-gap while the stator is external. (Two figures.)

18,711/14. Wireless Telegraphy. W. C. WOODLAND. A method of increasing the group frequency or tone pitch heard in the receiving telephone by dividing up a multiphase alternating current at the sending end into a plurality of intermediate phases, and energising a corresponding number of oscillatory circuits successively. (Three figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: WATSON and CALLENDERS CABLE & CONSTRUCTION CO. [Cables] 29,756 and 29,757/13.

Ignition: Soc. CARPENTIER, BAL, ET CIE [Sparkling plugs] 15,380/13.

Instruments and Meters: GIFFORD and NALDER BROTHERS & THOMPSON, LTD. [A.C. moving coil instruments] 1,877/14.

Switchgear, Fuses and Fittings: WERTHEIMER and OROGRAPH PROCESS & RADIANT SIGN CO. [Changeable signs] 8,361/13; DOI [Lamp-holders] 28,421/13; SHAW [Globe holders] 2,713/14; HOLT and SMITH [Switches] 20,796/13; JOHNSON [Automatic fuse] 20,958/14.

Telephony and Telegraphy: AUTOMATIC TELEPHONE MANUFACTURING CO. and SPERRY [Telephone systems] 1,970/14; HAMMOND [Distant control by electric waves] 2,679/14; GALLETTI [Method of producing impulsive discharges] 2,740/14; WESTERN ELECTRIC CO. (Woodward for W.E. CO., U.S.A.) [Automatic telephones] 3,359/14.

Traction: BROWNE [Signalling] 26,855/13; STUART [Electric railway system] 29,759/13; RENAULT [Car lighting] 2,528/14; ROYCE and ROLLS ROYCE, LTD. [Automobile engine starter] 18,829/14.

Miscellaneous: TURQUAND [Electric battery lamps] 2,063/15; WAYGOOD OTIS, LTD., AMPHLETT and WALKER [A.C. electromagnets] 9,093/13; PRESTWICH [Miners' safety lamps] 20,386/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Instruments and Meters: BURKE [Excess wattmeters] 270/15.

Telegraphy and Telephony: CONLEY [Telephone systems] 1,087/15.

Miscellaneous: FILS DE A. PIAT ET CIE [Gravity magneto machine for moulding an article and withdrawing it from the mould] 18,654/14; SIEMENS SCHUCKERTWERKE Ges. [Stray-wave protection for circuits] 723 and 831/15; MEIGS [Electrical apparatus for effecting the chemical combination of gases] 982/15.

The following Amended Specifications can now be obtained:—

Arc Lamps: SIEMENS SCHUCKERTWERKE, 23,188/13.

Telegraphy: H. ABRAHAM [Wireless receiver] 23,113/13.

Application for Suspension

25,101/12. Electrometers. H. BAUR. An application for the suspension of this enemy owned patent, which is for a unipolar static electrometer for determining the hardness of Roentgen-ray tubes, by R. S. Wright and E. E. Burnside, will be heard on Feb. 24th.

Applications for Amendment

16,409/04. Meters. B.T.-H. CO. Application has been made to amend this specification, which is for induction motor-meters, by omitting one of the claims and making other omissions on account of the doubtful novelty of a portion of the subject-matter.

17,487/14. "Wired" Wireless Telegraphy. G. O. SQUIER. Leave is sought to introduce an acknowledgment (at the request of Dr. Erskine Murray, Patentee of No. 15,718/11) of the lack of novelty of the use of a 0'01 mf. condenser on a high-frequency bridge for utilising ordinary telephone lines for "wireless" reception.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

3,481/01. Wireless Telegraphy. J. A. FLEMING and MARCONI'S WIRELESS TELEGRAPH CO., LTD. This describes a complete sending apparatus for long-distance work worked by alternating current, the principal feature of which is the use of a step-up transformer with closed primary circuit and adjustable regulating inductances.

3,570/01. Autographic Telegraphs. P. A. NEWTON (Gray National Telautograph Co., U.S.A.). One form of the well-known Gray writing telegraph or telautograph, in which the position of the sending pen controls two rheostats, and thereby causes currents of varying strength to be sent in two circuits, which reproduce the movements of the pen at the receiving end by the action of two floating coils in magnetic fields.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: H. HIRST and A. E. ANGOLD [Enclosed arc lamps] 24,566/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: W. T. HENLEY'S TELEGRAPH WORKS CO. and H. SAVAGE [Cables] 22,005/05.

DYNAMOS, MOTORS AND TRANSFORMERS: A.E.G. [A.C. commutator motors] 23,448/07.

Electrochemistry and Electrometallurgy: H. HELPFENSTEIN [Electric furnaces] 24,498/09.

Heating and Cooking: A. TREPREAU [Electric heating] 24,829/09.

Incandescent Lamps: DEUTSCHE GASGLÜHLICHTGES. [Metal filaments] 14,901/06; B.T.-H. CO. (A.E.G.) [Use of water gas as reducing and protecting agent in metal filament manufacture] 24,236/06.

Instruments and Meters: H. CHAPMAN [Photometer] 22,748/08.

Switchgear, Fuses and Fittings: H. ARON [Resistances] 23,279/04.

Telephony and Telegraphy: W. FAIRMENT (Brown Hoisting Co., U.S.A.) [Insulators for aerials] 24,163/06.

Traction: S. E. PAGE (Webber Railway Joint Manufacturing Co., U.S.A.) [Insulated rails] 23,121/03; B.T.-H. CO. (G.E. Co., U.S.A.) [Railway signalling] 23,686/06.

Miscellaneous: A. P. JONES ("Long Arm" System Co., U.S.A.) [Control of watertight doors] 21,679/05; T. J. MURRAY [Electric clocks] 22,819/08; STERLING TELEPHONE & ELECTRIC CO. [Mine exploders] 24,469/09.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Prof. E. W. Marchant's Paper on "Conditions Affecting the Variations in Strength of Wireless Signals," abstracted on p. 61 of last week's ELECTRICAL ENGINEERING, was discussed at the London meeting of the Institution of Electrical Engineers last Thursday. Attention was largely concentrated upon the theories which have been put forward as to the effect of the conditions in the upper layers of the atmosphere. Prof. J. A. Fleming, in a written communication, described measurements of a similar kind to those spoken of by Prof. Marchant, which he had been carrying out in conjunction with Mr. P. R. Coursey. Signals from the Eiffel Tower were received on a Einthoven galvanometer, and the monthly chart showed the same curious variation in signal strength as were recorded by Prof. Marchant. Prof. Fleming's observations showed that the greatest falling-off in the signal strength occurred when the conditions are cloudy both in Paris and in London, but he did not think that any generalisation could be drawn from observations extending over so short a period. Before we could draw valid conclusions, it would be necessary to have an antenna set up near Paris and an automatic record kept of the variations in signal strength occurring close to the sending station. Such an antenna, also, should be in duplicate, one being earthed and the other non-earthed. In the observations so far taken by Prof. Marchant and himself he did not see anything to show definitely whether these variations in signal strength are due to something happening at Paris, London, or Liverpool, or in the region between. He did not believe that in such a short distance as 200 miles the large variations in signal strength which have been observed in London would be entirely due to ionisation of the air. This view was supported by Dr. W. H. Eccles, Mr. Vivyan (Marconi's Wireless Telegraph Co.), Mr. J. E. Taylor, and Prof. G. W. O. Howe. Mr. Vivyan said that observations carried out at the Letterfrack wireless station, eight miles from Clifden, and at Glace Bay, rather tended to the opinion that the reasons for variations in the strength of signals were local at the transmitting station. He mentioned incidentally that it was common for Cocos Island to receive signals from ships in the neighbourhood of Melbourne, a distance of 2,500 miles, which must, he thought, constitute a record for a 1½-kw. station. Dr. Eccles did not think that messages received over a distance of 1,200 miles, as mentioned by Prof. Marchant, were to be regarded as "freak" signals. Samoa was often in communication with vessels off the coasts of Alaska, Mexico, and Chili, and such signals were received practically as an everyday occurrence over a distance of 2,500 miles in summer and 3,000 miles in winter. Mr. J. E. Taylor said he had very little faith in any of the theories which had been put forward as to a supposed ionisation of an upper layer of the atmosphere. There was normally a considerable potential gradient due to atmospheric electric charge, and the exposed antenna should have an appreciable field due to this atmospheric gradient. This superposition of the atmospheric potential gradient had in effect the property of greatly increasing the spread of the electric field from the antenna in an upward direction, and the variations recorded might be due to the fluctuations in this atmospheric field. Admiral Jackson referred to the long distances which it was possible to communicate in the Pacific, and suggested that this would be the most suitable place for conducting the organised observations necessary before a solution of the problem could be looked for. Prof. G. W. O. Howe thought that the theory of an ionised upper layer of the atmosphere was being pushed too far. One investigator attributed weakness in signals to this fact, another strength of signals to the same fact, and, indeed, this cause seemed to be held responsible for almost every variation in the strength. Mr. W. Duddell doubted whether the Einthoven galvanometer was the best for the purpose, and drew attention to a moving coil galvanometer recently constructed by M. H. Abraham, of Paris, which was as sensitive and had several advantages. Mr. Campbell Swinton expressed surprise that Prof. Marchant had obtained such consistent results with the crystal detector, and suggested that there was need of an instrument which would measure the oscillations without the necessity of having them rectified. Prof. Marchant replied briefly.

A review of the work which the Post Office is doing in connection with automatic telephone exchanges appears in

the February number of the *Telegraph and Telephone Journal*. In addition to the Epsom, Hereford, and Darlington exchanges already in operation, representing the Automatic Telephone Co., Lorimer, and Western Electric systems respectively, automatic equipment is being installed in fourteen others. Of these, four will be small village exchanges with an ultimate equipment of fifty subscribers each. They are at Kelvedon, Ramsey, Hurst, and Colnbrook, and all will be on a system specially developed by Siemens Bros. & Co. for this purpose. The equipment can be worked from primary batteries, which is an essential feature for such village exchanges where electric supply for charging secondary batteries is not usually available. This does not quite solve the difficulty, however, for a separate metallic circuit line is necessary to connect each automatic village exchange with its main exchange, and hitherto several villages have been grouped on one line, which is at the same time used for telegraphic purposes. For slightly larger exchanges the difficulty as to power supply is also existent, and the operating expenses of a manual exchange are so small that the high cost of automatic equipment may not often be justified. However, Chepstow (in the Newport area) is to have an exchange on the Automatic Telephone Mfg. Co.'s system, chiefly in order to examine its suitability for such small exchanges, with an initial equipment of 65, and designed for an ultimate of 100. The larger exchanges in which fully automatic equipment is being installed are as follows, the figures after each name representing the initial and ultimate equipment respectively:—Automatic Telephone Mfg. Co.'s exchanges at Accrington (700/1,500), Paisley (1,100/2,150) Newport (1,800/3,500), Blackburn (2,400/4,000), Portsmouth (5,000/7,000), and Leeds (6,600/10,000); Western Electric exchange at Dudley (500/1,600); and Siemens exchanges at Stockport (950/2,260) and Grimsby (1,300/4,000). In addition to this programme, a study of the Sheffield area has been completed, with a view to equipping the whole area on the automatic system, and it is thought that the replacement of the present equipment in the six exchanges in that area will result in a saving of £3,000 per annum. The work of equipment would take about three years from the time it is started. Arrangements are also in contemplation to replace the existing magneto "Central" exchange at Liverpool by a semi-automatic exchange to be erected in the "Bank" exchange building there.

The current number of the *Telegraph and Telephone Journal* also mentions the plucky conduct of the telephone operators at West Hartlepool during the bombardment on Dec. 16th. The West Hartlepool post office (where the trunk exchange is situated) and the local exchange close by were both in the line of fire. When the post office was struck, the operators were requested to take shelter in the cellars, but they remained on duty, as did those at the local exchange, where the traffic, as may be expected, was extremely heavy. In addition to the two operators on duty, assistance was given by the resident caretaker and her two daughters, as well as by two inspectors; they, however, could not cope with the whole of the traffic, which is normally dealt with by three operators. Subscribers were inquiring as to the meaning of the firing, and as to the safety of their relatives and friends. At Scarborough the three operators on duty also stuck to their posts, and urgent military calls to Hornsea, York, &c., were effected through before the wires were shot down and communication ceased. Although all the subscribers did not call up, the indicators on the switchboard all dropped owing to the vibration caused by the bombardment.

A Paper on "Wireless Call Devices" was read and discussed at the meeting of the Institution of Post Office Electrical Engineers on Monday. On the instructions of the Postmaster-General, representatives of the Press were not admitted.

ELECTRIC TRACTION NOTES

The Central London Railway Co. reports that owing to the war, work in connection with the extension between Wood Lane and Ealing Broadway has not progressed very rapidly, and the date of completion will therefore be delayed.

The Annual Meeting and Dinner of the Tramways and Light Railways Association, which is generally held at this time of the year, have been postponed to a date to be fixed.

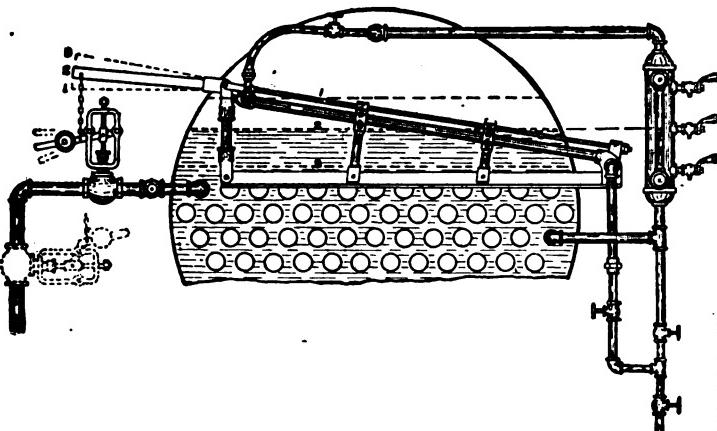

When the L.C.C. built the tramways from Shoreditch to Stamford Hill in 1906, a mile of the line was fitted with the side slot as an experiment. This, however, has not been found satisfactory, and the Committee now recommends that this portion be reconstructed on the centre slot system.

"ELECTRICAL ENGINEERING" TRADE SECTION

THE COPE BOILER FEED REGULATOR

WE have received from Scholey & Co., Ltd. (56 Victoria Street, Westminster, S.W.), a description of an interesting form of boiler-feed regulator on a thermostatic principle which has the advantage over some other systems of not simply keeping the feed-water at a constant level in the boiler, but makes allowance for the fact that on light loads the water should be higher than on heavy peaks. The figure shows the general arrangement. The inclined tube is arranged to contain a varying proportion of steam and water according to the water level. Its mean temperature and, consequently, its length varies, and, acting through a system of levers, these variations in length directly control the feed valve. Suppose the boiler to be normally loaded and the water level to be at the centre of the tube. When an increased load comes on, there is first a slight drop in pressure, and a more rapid liberation of steam from the entire body of water which causes an increase in its volume and a rise of level, which decreases the temperature of the expansion tube and causes it to shorten and the valve begins to close. This is exactly what is desired in order to obtain the maximum capacity of the boiler, since the heat being generated in the furnace is used to generate steam and not to heat feed-water at a time when every pound of steam counts.

As the heavy load continues, the evaporation of water

GENERAL ARRANGEMENT OF COPE BOILER FEED REGULATOR.

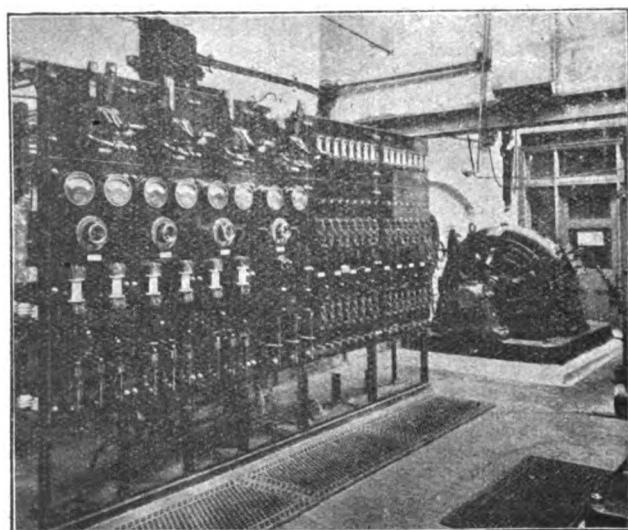

causes the level to drop, and this in turn causes expansion of the thermostat and gradual opening of the feed valve. The level in the boiler drops and the feed valve opens until a point is reached where the rate of feed equals the rate of evaporation and equilibrium is restored, the water being at a new level.

A decrease in load, on the other hand, causes a rise in boiler pressure, causing the fireman to decrease his draught, and this results in a smaller per cent. of steam bubbles in the water throughout the boiler, so that the mixture is more dense and the water level falls slightly, with an accompanying heating up and expansion of the thermostat. This immediately causes the feed valve to open wider and feed the water at a greater rate to the boiler, thus absorbing and storing heat which the furnace would otherwise waste. A decreasing load is then accompanied by a rising water level, since the rate of feed is in excess of the rate of evaporation. The rising level cools the expansion tube and slowly cuts down the feed again, so that at any fixed load position the rate of feed finally becomes just equal to the rate of evaporation and equilibrium is again secured, the water level now standing in the boiler at a somewhat greater height than it did at the normal load.

Railway Ticket Advertising.—A scheme of advertising on the backs of the tickets of the Metropolitan Railway, involving some special designs by John Hassall, has been initiated by S. Davis & Co. (30-31 St. Swithins Lane, E.C.), who have been appointed sole agents to the company for this form of advertising. A new poster calling attention to these ticket advertisements, with the legend, "It's a pity to puncture the picture," also by Hassall, will shortly appear.

SUB-STATION AT A BIRMINGHAM BRASS FOUNDRY

AS they found their existing steam-driven electrical plant inadequate for the growing demand for power in the works, a well-known Birmingham firm of brassfounders and manufacturers of bedsteads, electrical fittings, and similar appliances decided to take power from the mains of the Shropshire, Worcestershire, and Staffordshire Power Co. For the purpose of converting to continuous current the 5,500-volt, 25-cycle, three-phase supply afforded by the power company's mains, they laid down a 150-kw. rotary converter, and the opportunity was taken to instal a new "Witton" main switchboard of the open type. On this provision is made for

150-KW. ROTARY CONVERTER AND SWITCHBOARD IN WORKS SUBSTATION.

three generators and rotary converter panels and all the necessary works' feeders. The "Witton" rotary converter is compound-wound, and runs at a speed of 500 r.p.m., and supplies power at a pressure of 200-250 volts. It is started off low-tension tappings on the transformer in a very simple manner through a switch-panel provided with a three-pole throw-over switch. The converter runs up to speed without any sparking whatever on the continuous-current side and without the provision of any brush-raising device. To prevent high voltages being introduced in the field coils during starting, a field-splitting switch is fixed on the converter shell. The switch is opened during the starting period. The General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.), were the contractors for the converter and switchboard.

Ancient Engineering.—Owing to the efforts of the Igranic Engineering Society (Bedford), which consists of members of the staff of the Igranic Electric Co., Ltd., a course of three lectures has been given on Jan. 21st and 28th, and Feb. 4th, by Mr. R. P. Howgrave Graham on Ancient Engineering in Peace and War, with special reference to the evolution and development of engines of war and fortifications. The lectures were held in the Town Hall, Bedford, and were so well attended that a handsome sum, forming the whole of the proceeds, was handed to the Prince of Wales' and Belgian Relief Funds, for the benefit of which the lectures were arranged.

Callender's Hospital and Distress Fund.—Out of this Fund, which is composed of weekly penny subscriptions by the employés, augmented by the firm, directors and other donors, £283 has been contributed to hospitals, &c., during the year, and 288 hospital letters have been issued, 81 surgical appliances supplied, and 17 surgical aid letters were given, in addition to 19 convalescent home letters. Spectacles were supplied in 89 cases. The report states that at the outbreak of war 42 employés joined their regiments, and 127 enlisted since.

British Goods in France.—J. H. Tucker & Co. (King's Road, Hay Mills, Birmingham), have received a letter from a man at the front who has come across some of their electrical accessories in charge of an electrician, who said that he had never had any trouble with them, and asked to have price lists, if printed in French, to be sent to him.

A DETACHABLE FAN

THE fan illustrated in Fig. 1 is a special pattern which the Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex), have introduced for shipboard and railway train use. The base is provided with a bayonet joint and spring contacts like those of a lamp-holder, so that the whole fan can easily be removed at any time. A clamping ring makes the joint quite rigid. The motors are strongly

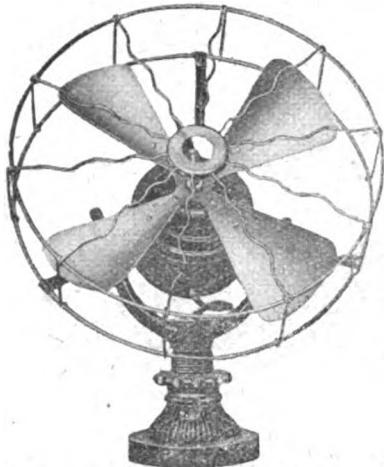

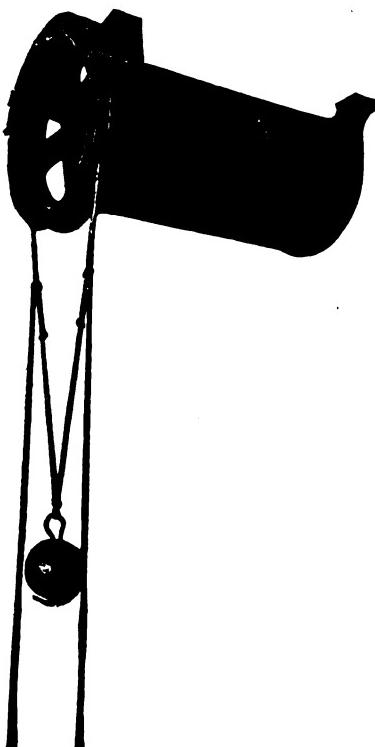

FIG. 1.—SHIP OR TRAIN FAN.

FIG. 2.—FAN REGULATION,
OR DRIVING SWITCH.

made and specially insulated to withstand sea, air, and hot climates. They can be used as ceiling, table, or wall fans.

In connection with these fans, the Company have brought out the simple type of controlling switch seen in Fig. 2. This is made up of a "two-way and off" wedge type tumbler switch fitted with a resistance wound on porcelain, with a ventilated cover enclosing the whole. This can also be used as a dimming switch for metal filament lamps, for which purpose its compactness is a great advantage.

ROPE-OPERATED CONTROLLERS

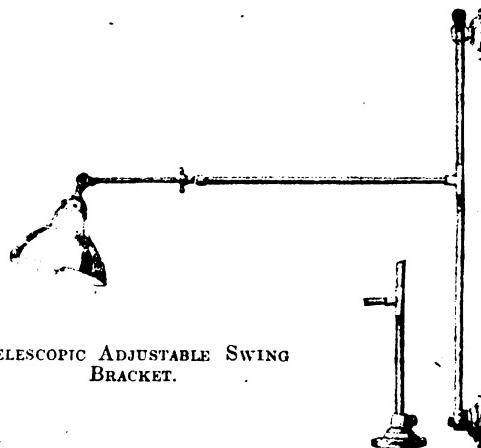

ROPE-OPERATED CONTROLLER.

ROPE-OPERATED controllers are extensively employed on cranes, monorail hoists and other classes of work. The design illustrated, which is manufactured by the General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.), is largely used on Witton-Kramer hoists, and a considerable number have been supplied for the control of motors supported from the ceiling. The controller is the standard "Witton" type, and in the smaller sizes can have the resistance contained inside the controller itself. It is of the reversing pattern, with weight return to the "off" position. This design of controller can be supplied for motors up to 25 h.p. continuous current and 16 h.p. alternating current. It can be provided with electric braking stops if desired.

Obituary.—We regret to announce that Mr. William Bulloch, director of the Electric Construction Co., Ltd., and manager of the Company's Bushbury works, died last week at the early age of 44. Mr. Bulloch has been associated with the E.C.C. for the past twenty years, at first in London.

AN EXTENSIBLE SWING BRACKET

THE simple design of adjustable bracket illustrated here has recently been introduced by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.). The horizontal arm is telescopic, giving a range for the lamp of from 24 in. to 42 in. By means of the wing-nut connection for the lamp-holder and reflector, the angle of the reflector is also adjust-

TELESCOPIC ADJUSTABLE SWING
BRACKET.

able. The telescopic horizontal arm terminates in a T-piece specially cut away in its lower half, so that the weight of the arm causes the T-piece to grip firmly the upright on which it slides. No clamping screw is required, and by holding the horizontal arm this can be moved instantly up or down or swung round in a vertical plane. This bracket may be used as a fixed standard by changing the position of the base-plate, as shown in the illustration. The device is protected by Patent No. 10,814/13.

WATERTIGHT DOOR INDICATORS

IN view of the requirements of the Convention for Safety of Life at Sea, Siemens Brothers & Co., Ltd. (Woolwich, S.E.), have introduced an indicator which enables the opening and closing of each individual door to be observed from the bridge. The indicator consists of a teak case fitted with an enamelled front on which is a plan view of the various decks showing the watertight bulkheads. The positions of the doors are indicated on the plan by means of small circular windows fitted with ruby glass. Electric lamps situated behind the windows are lit by means of special switches operated by the doors when closing, so that the windows are illuminated when the doors are closed. Two lamps are provided for each window as a precaution in case one lamp should fail. A window, illuminated by a lamp fed from the same circuit as used for the door switches, is also provided to indicate when the current is on. The switches operated by the watertight doors are contained in watertight cases and are very strongly constructed. They are operated by levers which are moved by the doors when closing.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—
Members: E. Beninson, C. E. Hunter, F. Samuelson. *Associate Members:* I. S. Dalgleish, H. F. McLoughlin. *Associate Graduates:* P. D. Chawdhry, J. P. Feloy, K. Ito. *Students:* W. H. Allemande, C. Ambler, J. A. A. Best, H. J. S. Brocklehurst, H. Diggle, L. Fossett, F. B. Gibson, W. C. Gomersall, F. J. Heyes, T. E. Houghton, P. B. Kalé, P. Miley, T. R. Mills, E. Stracey-Cheel, G. G. Wardrop, F. J. H. Wilson.

Candidates transferred:—*Associate Member to Member:* C. G. Cadman, A. Moir, R. Rankin. *Graduate to Associate Member:* M. B. Baker, H. C. Turner. *Student to Associate Member:* E. J. Edgar, H. P. Guy, A. C. Sparks, H. K. Whitehorn. *Student to Graduate:* S. Burns, S. M. Hill, H. A. Rickwood.

The Faraday House Journal.—The current number of this journal contains, besides interesting information as to the doings of past and present students of Faraday House, an article by L. Romero on transforming from three-phase to two single phases for single-phase distribution, and some mathematical notes by Dr. A. Russell. Another interesting contribution is by Mr. F. T. Chapman, on Saturation Effects in Alternating Current Apparatus. A supplementary list, with some portraits, of Faadians now serving with the colours is published.

AN EDISWAN LAMP UNDER FIRE

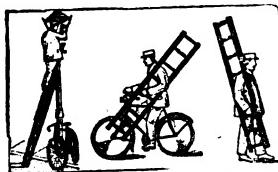

THE shrapnel-riddled motor-car headlamp illustrated here has been sent home by one of the under-foremen of the Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex), named Private H. Lacy, now serving at the

MOTOR-CAR HEADLIGHT AFTER SHELL-FIRE WITH UNDAMAGED EDISWAN LAMP.

front. The car in question arrived with many shrapnel holes, but with the Ediswan lamps uninjured. The assistant driver reports that half a dozen German shells burst near the car, and the driver was wounded in the back.

A LAMP TRIMMING LADDER

A STRONG but light form of ladder opening to 15 ft. and closing to 6 ft., which can easily be carried after a little practise on a bicycle, is illustrated here. J. H. Heathman & Co. (Parsons Green, Fulham, S.W.) have supplied a large number of these to electricity undertakings.

Sell's Telegraphic Address Directory.—The 1915 volume of this most useful directory consists of 2,600 pages, and contains 80,000 telegraphic addresses registered in the United Kingdom, whilst there is also a representative list of traders in the Colonies and abroad. The classified trade section contains over 100,000 names.

Arrangements for the Week.—*Friday, Feb. 19th.*—Royal Institution. "The Visit of the British Association to Australia," by Prof. H. E. Armstrong. 9 p.m.

Saturday, Feb. 20th.—Royal Institution. "Recent Researches on Atoms and Ions," by Prof. Sir J. J. Thomson, F.R.S. 3 p.m.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Belfast.—Twelve months' supply of cable and electrical accessories for the Tramways Department. General Manager. March 8th.

Bolton.—Twelve months' supply of motors, motor-starting switches, transformers, meters, joint-boxes, fuse-boxes, &c. Borough Electrical Engineer. March 4th. (See advertisement on another page.)

Cleckheaton.—Extensions at an estimated cost of £20,000 are contemplated. The Electricity Committee reports that it is not prepared to recommend the Council to accept an offer from the Yorkshire Electric Power Co. for a bulk supply.

Dover.—The Guardians contemplate putting down their own generating plant.

Grimsby.—The Electric Lighting Committee's recommendation that a loan of £11,000 be applied for in connection with the purchase of a battery, mains, and services has been referred back. Mr. W. A. Vignoles, the Borough Electrical Engineer, said that the battery was essential, as the station plant is now working up to its maximum capacity. The Chairman of the Committee said he would not remain on the Committee if the battery scheme was not proceeded with. Another Councillor suggested that it would be better to suffer some inconvenience next winter in regard to supply than pay the high interest which is now necessary.

Manchester.—Twelve months' supply of cable, lamps, carbons, &c. Stores Superintendent, Gorton. March 2nd.

Perth.—A 500-kw. turbo-generator is to be installed at an estimated cost of £3,900.

Salford.—Three 1,000-kw. motor converters or rotary converters and transformers, and one 500-kw. motor converter or rotary converter. Borough Electrical Engineer. March 6th. (See advertisement on another page.)

Urmston.—A Sub-Committee has been appointed to inquire into an electric lighting scheme in consequence of complaints of the gas supply.

Wrexham.—Twelve months' supply of meters. Borough Electrical Engineer. March 17th.

Wiring

Aberdeen.—Additions to Bradford Linen Works.

Ilford.—Central library.

Miscellaneous

Bolton.—Twelve months' supply of lamps, carbons, insulating materials, &c., for the Tramways Department. General Manager. Feb. 22nd.

Bradford.—The North Brierley Guardians require 800 incandescent lamps. Clerk, 4 Town Hall Street.

Edmonton.—Six months' supply of electric lamps for Guardians. Clerk, White Hart Lane, Tottenham.

London: Kensington.—Six months' supply of electric lamps and fittings for the Guardians. Clerk, Marloes Road.

Six months' supply of electric lamps, fittings, &c. Clerk, Princes Row, Buckingham Palace Road, S.W.

Newport (Mon.).—Electric lighting fittings. Clerk to Guardians, Queen's Hill. March 2nd.

Richmond (Surrey).—An inquiry is to be made into the cost of street electric lighting.

West Ham.—Three months' supply of electrical fittings. Clerk, Union Road, Leytonstone.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Heywood.—The following tenders have been accepted:—Converting plant, E.H.T. switchgear, and sub-station plant, British Westinghouse Co.; switchboard and cables, Bertram Thomas; battery booster, Phoenix Dynamo Manufacturing Co.; overhead mains, British Insulated & Helsby Cables, Ltd.

Newport (Mon.).—A contract has been placed with Messrs. J. H. Tucker & Co. for a twelve months' supply of electrical accessories.

Plymouth.—A tender by the Brush Electrical Engineering Co. for six car-bodies and trucks at £470 each, and that of

the British Westinghouse Co. for the electrical equipment, have been accepted, subject to the necessary loan being sanctioned.

APPOINTMENTS AND PERSONAL NOTES

A jointer is required for the Swindon electricity works. (See advertisement on another page.)

There are vacancies for a linesman, draughtsman, and an assistant works illuminating engineer.

A Tramways Manager is required at Southampton. Salary £400 per annum. Town Clerk, Feb. 25th.

An electrical foreman is required for Federated Malay States Government Railway. Salary £280, rising to £350 per annum. Preece, Cardew & Snell, 8 Queen Anne's Gate, S.W.

Switchboard attendants are required at Swindon and Blackburn.

LOCAL NOTES

Dartford: *Resignation of Vice-Chairman.*—Councillor Bennett, Vice-Chairman of the Electricity Committee, has resigned both from the Committee and the Council as a protest against what he considers the "sustained policy of opposition, wordy and frivolous to a degree, and which has proved most detrimental to the undertaking." Councillor Bennett's action has been accelerated by recent criticisms upon plans and estimates prepared by the Borough Electrical Engineer, which have been passed by the Local Government Board Inspector and received favourable recommendation from Sir John Snell.

Dublin: *Probable Increase in Charges.*—A special meeting of the Electricity Committee is to be held to consider the estimates for the coming year. It is intimated that an increased rate of charging for current will be necessary to meet the greatly increased expenditure.

Elland: *Current for Cinemas.*—The Council, after interviewing a deputation representing the owners of picture theatres in the town, have agreed to reduce the price for current for cinematograph lanterns to 2½d. per unit.

Epsom: *The "Solid" Mains.*—The Acting Borough Electrical Engineer reports that the old solid mains are in a very bad condition, and likely to break down at any point. His examination has shown that there are very few places where these mains have not been disturbed either by the Gas Company or the telephone authority, whilst in many cases the wood casing has entirely rotted away. Several sections call for immediate attention.

Shop Lighting.—It has been decided only to charge consumers who have contracts for outside shop lighting and maintenance the cost of maintenance and keeping the lamps in order whilst the present restricted lighting conditions are in force.

London: *Woolwich: Loan Periods.*—When Sir John Snell first recommended that the Plumstead works should be closed down, an arrangement was made with the L.C.C. to shorten the term of years over which the cost of the plant at the works was to be repaid. Having regard, however, to the fact that it is now proposed to retain the works as stand-by, the Finance Committee of the L.C.C. is to be asked to suspend the operation of this latter arrangement.

Stoke-on-Trent: *Overdraft.*—In connection with recent

applications for loans, the Local Government Board Inspector pointed out that the Corporation had an overdraft on revenue account of £6,890 on March 31st, 1914, and the Corporation has now been asked what steps it is proposed to take with regard to this. The Town Clerk has given an undertaking that this overdraft will be liquidated during the next three years.

Wednesbury: *Increased Charges.*—In consequence of the Mond Gas Co., which supplies the gas for driving the dynamos at the Council's electricity works, being compelled to revise its schedule of charges, the Electricity Committee has notified its consumers that as from January 1st, 1915, an addition of 15 per cent. will be made to the net amount of all electric supply accounts.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Yorkshire Electric Power Co.—The net profit for 1914 was £20,535 against £15,401 in the previous year. An interim dividend has been paid on the 6 per cent. preference shares, and also 2 per cent. on the ordinary shares. It is now proposed to complete the preference dividend for the year, to write off £2,250 the bonus on second mortgages, to transfer £7,500 to general reserve, and carry forward £5,049. The serious reduction in the current consumed during August and September owing to the war has prevented the directors from paying the dividend on the ordinary shares for the second half-year. During the last three months of the year, however, considerable improvement was made.

South Metropolitan Gas Co.—At the annual meeting last week Dr. Charles Carpenter, the Chairman, referred to the question of coal supplies, and mentioned that 90 per cent. of the Company's own coal vessels have been taken over by the Government. This, he said, he did not complain of, but he was a little surprised that the Government should charge the Company competitive prices, in the present highly inflated market, for the use of the interned steamers to take the place of the Company's own vessels. With regard to the London Electric Power Bills, he said that the gas companies were entitled to ask for a fair field and no favour, and that schemes like the L.C.C., involving the possibility of a call upon the rates, should not be sanctioned by Parliament. An example of the manner in which municipalities conducted electrical undertakings was to go to a large consumer of gas, ascertain by an examination of his account how much he paid per annum, and then offer to supply all the current required in substitution at a price per unit which was specially worked out to come lower than the cost of gas.

London Electric Supply Corporation.—The directors in their annual report direct attention, in view of the repeated statements that London is suffering from the want of a cheap supply of electric power, to the fact that the Company's average receipt per unit sold in 1914 (lighting and power) was 0·94d., compared with 1·04d. in the previous twelve months.

Westminster Electric Supply Corporation.—This Company, which, as we announced last week, is paying a 9 per cent. dividend on its ordinary shares for 1914 compared with 10 per cent. for 1913, reports that the darkening of the streets does not appear to have affected the Company directly, as the amount received from public lighting was practically the same for the two years. The diminution in dividend, however, is accounted for by the reduction in the revenue from shops and private lighting.

Notting Hill Electric Lighting Co.—The loss of revenue last year attributable to the Government war regulations, restricting the lighting in London, was £2,000. Nevertheless the dividend of 5s. per share less tax on the ordinary shares is the same as last year. Under the Company's co-partnership scheme, which came into operation in 1912, the staff received an amount equivalent to an addition of 8 per cent. to wages.

British Westinghouse Co.—Arrangements have been made whereby the French and Italian Westinghouse Companies will be managed by the British Co.

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £68 to £68 10s. (last week the same).

SUMMARY

AT a conference between delegates of the Electrical Contractors' Association and the B.E.M.A. on the question of municipal powers for hiring out and selling apparatus, there were indications that the E.C.A. will give way on the question of hire-purchase as they have already done on hiring, but they still firmly oppose sale of apparatus by municipal electricity departments. The general situation is also reviewed (p. 80).

AN interesting discussion on "Wiring" took place at Newcastle last week. It was largely devoted to praise and criticism of the cab-tyre sheath system, but other points were dealt with as well (p. 80).

A PAPER read before the American Institute of Electrical Engineers described the Beck searchlight, which has given remarkable results in tests against the standard projectors of the United States Navy (p. 81).

THE proper combination of artificial lighting arrangements with decorative schemes was the subject of a Paper by Mr. F. W. Thorpe read at the last meeting of the Illuminating Engineering Society (p. 82).

THE power Bill promoted by the London electric supply companies is not to be proceeded with this session (p. 82).

In Hull and Manchester, wiremen have asked for an increase of 1d. an hour in wages, and have been offered ½d. increase. In Newcastle 1d. has been offered. In London there is to be a demand for 1½d. increase, but this has not yet been formally made to the Masters' Association (p. 82).

THE cause of a motor frame becoming live in parti-

cular circumstances is discussed in our "Questions and Answers" columns (p. 83).

CONSIDERABLE progress is being made with the conversion of the suburban lines by the L. & S.W. Rly. to electric traction.—A rating appeal with regard to the L.C.C. trams in Islington has been decided in the House of Lords (p. 83).

DAMAGES amounting to £1,100 have been awarded against the Dublin United Tramways Co.—The enlargement of the City & South London Railway Company's tunnels has been suspended owing to the conditions of the money market.—Considerable progress has been made with the electrification of the London & South Western suburban lines (p. 83).

AMONG the subjects of the specifications published by the Patent Office last Thursday is the filling of the interstices of paper cables with oil, and an A.C. system of driverless train control. The Hemming conduit grip patent has been granted in spite of opposition. A patent in connection with lead presses for cable covering expires this week after a full life of 14 years (p. 84).

THE results of Messrs. Lundbergs' recent electric-light switching competition are announced this week; the quality of the Papers was above the average of previous competitions (p. 85).

AN electrical refrigerating plant and an adjustable fitting are described, and notes are given on half-watt lamp installations in our Trade Section (pp. 85-87).

MAINS, converting plant, meters, and switchgear are required at Battersea (£15,750); new plant at Stirling; cable, meters, lamps, &c., at Aberdare, Dover, Islington, and Pontypridd.—Street electric lighting is to be carried out at Leicester (p. 87).

THE Dublin Electricity Committee has decided to increase the lighting charges by ½d. per unit and power charges by ¼d. per unit. Electric cooking apparatus is to be installed in workmen's cottages at Barnes.—An endeavour is to be made to deal with small property at Aylesbury on the fixed charge system (p. 88).

ALTHOUGH the South Metropolitan Electric Light & Power Co. made £1,500 more profit in 1914 than in 1913 no dividend is declared on the ordinary shares.—The Chelsea and Charing Cross Companies maintain their dividends at 5 per cent., and the County of London Co. at 7 per cent. (p. 88).

(For Arrangements for the Week see p. 87.)

Pilot Lamps for Heating Circuits.—The use of pilot lamps on heating circuits is very general in England, but we note from the *Commonwealth Engineer* that in Sydney their use has been made compulsory. The Council has notified contractors that it will not connect up any installation in which provision is made for the use of non-luminous heating apparatus, unless a pilot lamp of small candle-power, with the glass tinted red, is connected in such a way that the lamp must be alight while the current is "on." A pilot lamp must be provided for each separate piece of apparatus.

THE ELECTRICAL CONTRACTOR AND HIS "RIGHTS"

THE Electrical Contractors' Association objects to Municipal Electricity Departments exercising or acquiring powers to sell electrical apparatus or to wire houses, and its members are apparently not too pleased either that Corporations should hire out motors or cookers, particularly if any inclination is shown to do the wiring to them without sub-letting it to a wiring contractor, and they object to hire-purchase by the Corporation. A case has recently arisen for the contractors to show what they can and will do to assist an electricity undertaking which has no wiring, hiring, or selling powers, and it is interesting to see to what extent the contractor is helping. At Oldham the Electricity Department were anxious to extend their power load, but had no powers to hire motors. They therefore, a number of years ago, arranged with a firm of manufacturers (the General Electric Co.) to supply consumers with motors on the hire and hire-purchase system. In all cases the wiring was left to the contractor to do. This worked well for some time, but then the local contractors raised objections through the "Electrical Section of the Oldham Chamber of Trade"—there is only one member of the Electrical Contractors' Association in Oldham. It was therefore agreed that the Electricity Department should in all cases give the local contractors the first option of supplying the motors by referring the consumer to them, but if he could not get his contractor to hire a motor the Corporation would then have it supplied under their arrangement with the General Electric Co. We have no definite record of the number of motors hired out by the contractors after this, but we believe that it was not very great, and, at any rate, the Corporation still found it necessary to continue to hire out a number of motors through the manufacturers so as not to miss new power consumers.

But the position with regard to electric cooking and heating appliances is even worse. Three years ago arrangements were concluded at Oldham with this same Electrical Section of the Chamber of Trade that the contractors should supply consumers with cooking and heating appliances on the hire-purchase system. Up to last July not a single appliance had been supplied on this system, and, in fact, the prices had not yet been formulated. The matter was raised again in January, and the Electricity Department then received a letter from the "Chamber," stating that its Electrical Section "has been in correspondence with a number of makers, and find that, by the rules of their Association, they are precluded from entering into any agreement for the hire of these appliances, but the members of the section have decided to take that business in hand individually." This after the matter had been settled three years ago—so presumably there is as little prospect of the scheme succeeding as in the case of motor-hiring and hire-purchase.

Is it to be wondered at, therefore, that the municipalities with electricity undertakings wish to have full powers to stimulate the demand for power, heating, and cooking by supplying the apparatus themselves?

We have referred to the fact that the Electrical Contractors' Association has but one member in Oldham. The reason is not far to seek. The Association's policy is essentially conservative and not progressive—we use the terms in the literal and not political sense. It takes practically no part in extending the electrical industry. The popularisation of electric light and the introduction and development of electric power, heating, and cooking are left to the supply undertakers and the manufacturers; the chief care of the Association is that its members should enjoy the middleman's profit on business they do not introduce as well as in business they introduce. The wiring contractor whose main business is wiring has little to gain by joining the Association, nor has the contractor established in a town such as Oldham in which the Corporation has no wiring or selling powers. In spite of the very active propaganda carried on by the Association during the past twelve months, in spite of the fixed determination of the municipal electrical engineers to get powers to enable them to concern themselves more with the consumers' installations and the sale and hire of apparatus, the membership of the Association has been increased only by four firms. Last March there were 378 firms belonging to the Association; since then 30 have joined and 26 ceased to be members. It is greatly to be regretted that an Association with clever men at its head should confine practically its whole attention to restricting trade instead of taking steps to increase it. Its main activities are directed to preventing electricity supply undertakings and manufacturers from selling apparatus direct to the users.

Last month the President of the Electrical Contractors' Association met the Acting President of the Incorporated Municipal Electrical Association with a view to arriving at a compromise with regard to the proposals for extending the powers of electricity undertakings to hire and sell fittings, &c. The I.M.E.A. had already given way on many points in order to enable their proposals to be adopted without opposition in Parliament, and their scheme is now practically as follows:—The Corporations are to have power to let out heating and cooking apparatus, motors, &c., on hire or hire-purchase. They will keep large showrooms to interest consumers in extending applications of electricity and put themselves in such a position as to sell the apparatus directly to the consumer if he desires it. To safeguard the contractor from competition with his legitimate business, they offer not to sell anything below the usual market rate; they undertake to do no wiring on the consumer's premises, and to show no undue preference in letting contracts for wiring for which they have been given an order by a consumer. They further offer the free use of their showrooms to contractors who may desire to show a customer any apparatus they have not themselves in stock, and if this results in sales direct from the showroom instead of through the contractor, to give the contractor the whole of the trade discount, and to refer any dispute to arbitration.

It is difficult to conceive a fairer offer, or one more advantageous to both parties; but the President of the E.C.A. will have none of it. The Corporation, he says, must not sell, and must not even let out on hire-purchase; it must not carry out the maintenance of apparatus and installations it lets out on hire; and the Corporation must not place its wiring orders with wiring contractors on the ordinary business basis, but must have a list of contractors (presumably all members of the E.C.A.) to whom the work is to be allotted in rotation.

Obviously the conference between the two parties led to no result.

Since then there has been another conference, this time between representatives of the Electrical Contractors' Association and the British Electrical and Allied Manufacturers' Association, for the B.E.A.M.A. are obviously affected if the sales of motors and other electrical apparatus are throttled by this dispute. At the conference the E.C.A. were inflexible as regards the sale of apparatus, which they contend should only be done by electrical contractors, but they now show signs of giving way with regard to hire-purchase, as apparently they have already done with regard to pure hiring out. But, of course, the imposition of terms and conditions are suggested to safeguard the contractor that hire-purchase is not simple purchase. There seems little reason to doubt that the sympathies of the B.E.A.M.A. will be chiefly with the I.M.E.A., for the members of the latter, if they get the full powers they seek, will be the larger customers for the electrical manufactures which they have to sell.

WIRING

A DISCUSSION on electric wiring occupied the attention of the Newcastle Section of the Institution of Electrical Engineers at their meeting last week.

The discussion was opened by Mr. J. H. C. Brooking, who gave an interesting account of how the Cab-Tyre Sheathed cable had been developed. It was originally evolved to get over the troubles of a prominent Northumbrian colliery company, few of whose trailing cables had hitherto lasted more than six months under the severe conditions of sea-water and rough usage at the coal face. The first Cab-Tyre Sheathed cable was made for this purpose over four years ago, and is still in use. Gradually, however, a demand came for similar cable for other purposes, first by colliery owners and then by others. Mr. Brooking was most emphatic on the durable qualities of this class of material, and offered to eat a piece of cab-tyre (already ten years old) in fifty years' time if it were not then in the same condition as now. After quoting some figures to show that wiring with C.T.S. cable had also low cost in its favour, he dealt next with the question of fittings. With this cable, he said, ordinary standard fittings could be used, but for jobs such as breweries, &c., he had found that the so-called "corrosion-proof" fittings on the market were useless for their purpose. In consequence, his firm had been reluctantly pushed into placing a series of simple non-corrodible fittings on the market, which Mr. J. C. White had designed in porcelain for use with their own cable. These were moisture-proof, corrosion-proof, inexpensive, and easily fitted.

Mr. O. L. Falconer referred to a paper read by him some twelve years ago, in which he had had faults to find with every

system then in use. He thought that, if he were re-writing that paper, it would not be necessary to make many alterations. He had then suggested that some type of armoured cable would eventually be employed, and for wiring purposes cab tyre sheath cable might be looked upon as being armoured. He suggested that manufacturers of new systems should guarantee them for, say, three years, and offer to indemnify the contractor against consequential damages.

Mr. C. Turnbull said many of the troubles of electrical installations were due to sheer carelessness, such as screwing on bends after the wires had been threaded through, and omitting to remove the oil which was used when threading the pipes. He doubted very much if slip joint tubing could be efficiently earthed. The weak point in metallic sheathed cables was leakage on the ends, and in his opinion the ultimate wiring system would be one in which there were no conductors except those for carrying the current. He had used C.T.S. for wiring work, to some extent, and had found it very satisfactory. A disadvantage was that a careless workman was apt to nick the smaller-sized wires when boring, but this could be got over with care. Another difficulty was in ensuring that the sheathing took the weight of the fitting. Finally he suggested that C.T.S. would be much more widely used if the price were more reasonable.

Mr. W. Cross said that he had not had much experience with C.T.S. wiring, on account of the cost, although he admitted that there was nothing better for trailing cables. He asked what guarantees the makers would give that it would withstand the action of wet plaster, over a period of years. He thought that for this work it would be much better to insert a length of tubing, and this also made repairs and extensions a simpler matter. He also asked for further information regarding the effect of continued heat on C.T.S., such as it would be subject to if run on the ceiling of a warm room, and he wanted further information as to its fireproof properties. He suggested that in many cases the cost of wiring work could be reduced quite safely by using cheaper material and workmanship, and said that his experience of C.M.A. cable was that it was not so good as the non-Association quality made by Association makers, and that Association makers were not always able to recognise their own productions; in one case 2,500 megohm grade cables had been submitted for report and had been returned as 300 megohm grade only. Many of the troubles with slip joint tubing, he continued, were due to tubing being placed in contact with gas and water pipes, and he considered that the system was perfectly satisfactory for houses and offices if properly installed, while casing was also satisfactory for thoroughly dry situations. He had had much trouble with screwed tubing and 2,500 megohm grade, due to condensation. The success of any wiring job depended largely upon the workmen, and he would prefer good workmen using bad material to bad workmen using good material.

Mr. W. F. T. Pinkney did not think it a recommendation to say that unskilled workmen could be employed on C.T.S. wiring, for unskilled workmen should not have any hand in wiring at all.

Mr. Gillett said that architects usually looked upon the wiring of a building as a purely secondary consideration, and suggested that examinations for wiremen should be made compulsory. Slip joint tubing was useless in damp situations, and for dry situations had no advantages over casing. He mentioned one 500-light job which was done in casing 18 years ago, and the first fault had developed only recently, whereas a slip-joint job of about the same size had developed faults in less than 15 months. The cost of wiring work, he said, had gone up about 50 per cent. during the last 15 years. With regard to the use of C.T.S. cable on electric irons, he said that the average annual cost per iron per annum for flexible cable was only 4d., and it did not pay to instal an expensive type of flexible. He considered lead-covered wire very unsuitable for the majority of wiring jobs.

Mr. White said that although the cost per job, using C.T.S., might be a little higher than in the case of slip-joint tubing, the fact remained that a staff of workmen could get through more jobs in a given time using the former, and that at the end of the week the balance was in favour of the C.T.S. system.

Mr. W. Baxter said that he had had a good deal of correspondence with Mr. Brooking regarding C.T.S. wiring, and while he agreed that standard fittings could be used in conjunction with C.T.S. wiring, he strongly recommended the issue of a new booklet showing the necessary details. He suggested that Mr. Brooking should approach the architects who did the specifying for large jobs, and who in the majority of cases were content to use the systems which their grandfathers had used before them. Finally, he said that he had conclusive proof, from tests, that rats would not attack C.T.S. wiring.

Mr. Brooking, in the course of his reply to the discussion, dealt first with the suggestion of a guarantee, and said that no one gave them this in connection with any other system. He showed some samples of C.T.S. and other types of cable which had been immersed in a solution of nitric acid at the commencement of the meeting, and it was clearly to be seen that the acid had attacked all the other types of cable, but that C.T.S. was in exactly the same condition as at the start. The

necessity for some method of gripping the sheathing, in connection with the suspension or flexible, was not peculiar to C.T.S. C.T.S. was not exactly fireproof, but if a length of cable was ignited it would not support combustion if held vertically. This had recently been tested by the electrical engineer to a large insurance company, and it had been proved that so-called fireproof wood casing burned quicker than C.T.S. when ignited under the same conditions.

SEARCHLIGHTS

A PAPER by Mr. C. S. McDowell, read on Feb. 18th at the Midwinter Convention of the American Institute of Electrical Engineers, gave some interesting particulars of a new type of searchlight, originating in Germany, which has been tested by the American Navy. In the preliminary part of the Paper the general requirements of a good searchlight projector were summarised and methods of testing the accuracy and absorption of mirrors were described. A searchlight arc should excel in the following particulars:—Small positive carbons with high current densities, and thus high crater temperature throughout the crater area, which gives high intrinsic brilliancy, small negative carbons, long arc length, uniform carbons to secure even burning.

In the new German Beck lamp (which has already been referred to briefly in ELECTRICAL ENGINEERING, Jan. 28th, p. 35) these requirements are met as follows:—Both carbons are rotated for the purpose of keeping their surfaces bathed in the inert gas and to keep the arc central and thus to promote evenness of burning. The positive holder is fixed, and the carbon is fed through it at such a rate that the crater is always maintained at the focus of the mirror. The rate of feed is controlled automatically, a small mirror being placed in the drum which, when the carbon feeds too slowly, reflects a small beam on a thermocouple, and closes a relay circuit which by means of a solenoid quickens the feed. When the carbon is back in focus the small beam of light is off the thermocouple and the feed is slowed down. In addition, the feed may be controlled by hand. The negative carbon feeds through the negative holder in a similar manner, except that the control is by hand. The negative holder is also fixed except when striking the arc, when it is moved up by a striking motor. The lamp is reported to have behaved extremely well on its tests, especially as regards constancy of focus.

In a searchlight the angle of dispersion is directly dependent on the diameter of the source of illumination, provided the focal length is constant, and if the diameter of the source can be decreased one-half while the candle-power remains constant, the intensity of light on the target would be quadrupled. Actually, in the Beck light the positive carbon is reduced one-half, and at the same time the candle-power is increased so that greater efficiencies are obtained. To decrease the angle of shadow it is necessary to increase the arc length or decrease the diameter of the negative carbon. The arc length is restricted to the stability point of burning. The arc length of the Beck lamp is maintained constant at about $\frac{1}{2}$ in. as compared to about $\frac{1}{4}$ in. obtained at 60 volts in the standard 96-in. projector lamp used in the American Navy.

In the Beck arc the ends of the positive and negative carbons are enveloped in the hydrocarbon vapours which prevents the consumption of the carbons at a lower temperature, by keeping oxygen from them; in addition, it cools the outer shell of the carbons, the gas being at a temperature of about $1,000^{\circ}$ C., and thus concentrates the current in the centre of the carbons; thus a current density greater than 0.75 amperes per sq. mm. is obtained, and the whole crater of the positive carbon reaches a very high temperature. The current is brought to both carbons near the ends by roller contacts, so the only part having this high current density is the part protected by the indifferent gas. The positive carbon is cored with a rare earth with a melting point at about $3,500^{\circ}$ C. The positive develops a deep crater, about 12 mm. deep, filled with incandescent gas. The area of the positive carbon is 201 sq. mm., the area of the ordinary 96-in. light positive carbon is 805 sq. mm. In addition to the black body radiation obtained from the crater, there is a large amount of light radiated from the incandescent gas in the crater of a selective nature. The temperature of the incandescent gas within the positive crater is estimated to be between $5,000^{\circ}$ and $5,500^{\circ}$ C.

The light given has a more bluish appearance than that of the ordinary searchlight, and it is claimed that this enables ships of a bluish-grey colour to be picked up more easily. From comparative tests it was seen that the maximum illumination of 44-in. Beck searchlights was $2\frac{1}{2}$ times and

the mean illumination about 5 times as great as a standard 60-in. light. In the Beck searchlight the beam shows a very high illumination at the centre, and falls off rapidly at the edge of the beam. The maximum candle-power obtained with the use of the present American Navy standard carbons is 45,000 candle-power, as against 88,000 candle-power obtained from the Beck lamp.

ELECTRIC LIGHTING AND DECORATION

AT the last meeting of the Illuminating Engineering Society, Mr. F. W. Thorpe read a Paper on the development and design of lighting fittings in relation to architecture and interior decoration. In the first part of the Paper he traced the development of modern fittings from the ancient lamps and later candle fittings, through the various styles of architecture and decoration. Dealing with the decorative side of illumination, he emphasised that "effect" should be considered as well as efficiency in determining the style of fitting to be adopted. There were some cases where the illuminated surroundings constituted the vital point of interest, and it was preferable not to have one's mind distracted by speculations as to the origin of the light illuminating them. In other cases the light source should be made an essential part of the scheme of decoration. Fittings were too often designed with a view to daylight effect, but the brightness of the lamp when alight made it impossible to see the metal-work. The use of modern illuminants in old-fashioned fittings was sometimes considered an incongruity, but, in the author's opinion, if the light source was so shaded as to conceal its nature, the objection disappeared. The lighting of public buildings must be a definite part of the architectural scheme, and the position of fittings must be decided at an early stage. The design of lamp-posts, brackets, &c., for external lighting was equally a matter of architecture, and with certain notable exceptions, such as those in the Mall, this had been sadly neglected. Of late years a great deal of attention had been devoted to the design of fittings with a view to the distribution of light in the most efficient manner, but in many cases the artistic standpoint had been lost sight of. On the other hand, it must be admitted that several types of fittings designed on traditional lines were not particularly efficient as distributors of light.

It was a question how far indirect and semi-indirect lighting could be combined with any of the traditional styles. Indirect fittings of certain periods (Tudor, for example) were sometimes made, and their effect might be pleasing. Yet an indirect fitting in a Tudor manor house, having, perhaps, half-timbered ceilings, however deftly adapted, would be an anachronism. On the other hand, in lighting halls with fine painted ceilings the method is effective provided other supplementary lighting is included to relieve any possibly depressing effect from dark surroundings. Indeed, the use of indirect and semi-indirect lighting should have a distinct influence on ceiling decoration, and it was inconceivable that such methods might give rise to an entirely new method of decorative art. In buildings used mainly by artificial light (theatres, for example) the design of the ceiling had often been expressly adapted to artificial light. Domes had been constructed acting as reflectors, in other cases ceilings and columns of diffusing glass or alabaster had been built in and lamps mounted behind them, and cornice-lighting had been applied in conjunction with decorative friezes.

In the discussion Mr. A. P. Trotter and others emphasised that interior lighting was largely a matter of individual taste, and some difference of opinion was expressed as to how closely the fittings should follow the decorative style. One speaker, Mr. E. P. Warren, said that we could not always be repeating the work of other people, or designing, as he put it, in "inverted commas," and protested against the idea that fittings should be in any kind of obeisance to the style of the building. Mr. P. J. Waldram also mentioned some simple but beautiful designs of fittings which were far from being copies of recognised styles. Mr. C. H. Burt, on the other hand, speaking as a fittings manufacturer, said it was no use designing new types, as he doubted whether they would be accepted by architects as forms which they could embody in their decorative schemes. The same speaker regretted that the voltages at present in use rendered lamps necessary of a size which was not the best from the point of view of fittings design, a point regarding which a particular instance had been mentioned by Mr. A. P. Trotter. Mr. P. Marks thought that the co-operation of lighting specialists with the architects was necessary to obtain the best results—a view that was endorsed by Mr. Penn.

LONDON POWER SUPPLY

The Bill Withdrawn

In referring to the London Electric Power Bills on page 67 of our last issue, we mentioned that there was a probability of the Bill promoted by the electric supply companies being postponed. The Chairman of Committees in the House of Commons subsequently undertook to ask the promoters of any Bill of a contentious character to withdraw it before the second reading stage is reached, the reason being that it is felt undesirable to spend public money in this direction at the present time. In these circumstances the Companies' Electric Supply Bill dealing with London, which was down to be read a second time on Monday, will not be proceeded with this session. The number of petitions against the Bill which we noted last week as 38 finally reached a total of 51.

At the meeting of the St. James's & Pall Mall Electric Light Co. last week, Mr. Walter Leaf, the Chairman, said that whilst not admitting that London even under existing conditions had any reason to be ashamed of the cost of its electricity supply, the directors were prepared to advise the shareholders to sell their property either to the L.C.C. or to an amalgamation at a fair price and on fair conditions. He nevertheless suggested that it was doubtful whether concentration of the whole of London's electricity supply in one or two large power stations would conduce to a sense of public security in present circumstances. He had, however, every confidence in the future of the Company, and the time between now and the end of the war could be well spent in negotiations of one sort or another.

WIREMEN AND WAGES

AFTER the wiremen's strike in London last spring and summer had terminated by the men accepting the code of Working Rules issued by the London Electrical Masters' Association in March at the commencement of the dispute, a joint board of the Masters' Association and the Electrical Trades Union was constituted to investigate complaints with regard to the operation of these rules. The complaints of breaches of the rules were not numerous; all came from the men's side, and, so far as it was possible, were satisfactorily settled. Only four meetings of the Board have been necessary. It is now proposed that the joint board shall continue holding meetings every two months, and that its powers be extended to enable it to suggest any alterations in the working rules that may appear desirable. At a meeting of the London section of the Electrical Trades Union on January 30th resolutions were passed to the effect that application should be made for an advance of wages from 10½d. to 1s. an hour and a 48-hour week, and that the delegates to the joint board should move for the deletion of the "disability clause" and all reference to pipe-fitters and improvers in the working rules—thus practically raising all the issues of last year's strike. On inquiry from the Secretary of the London Electrical Masters' Association, however, we are informed that no application to them has yet been made for the increase in wages and shortening of hours referred to.

In Hull and Manchester, however, the wiremen have asked for an increase of 1d. per hour, and been offered ½d. increase (from 8½d. to 9d. in Hull, and from 9½d. to 10d. in Manchester), and in Newcastle we hear that an increase of 1d. has been offered by the masters, bringing the standard minimum wages to 10½d. per hour.

The National Electric Light Association of America.—The Proceedings of the 37th Convention of this Association held in June last at Philadelphia are published in four large volumes. The first is devoted to reports general and executive sessions and concerning public policy and company matters. Another volume deals with the "commercial" sessions and contains among other things some interesting information on American methods of street lighting. A separate volume is also devoted to accounting. The remaining volume contains most of the technical matter. A special session was devoted to hydro-electric and transmission matters, and some of the latest developments in California and elsewhere are described in the papers and reports. Among other miscellaneous technical subjects treated are electric vehicles, an address on which was given by Dr. C. P. Steinmetz, and the effect of temperature on the power capacity of electrical apparatus. A Paper on the latter subject by Mr. F. D. Newbury describes interesting experiments on the effect of heating on the actual insulation of machines. A very large number of other subjects are treated in the Papers and reports of committees presented.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS. A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,431.

I am in a sub-station where 11,500 volts, 25 cycles is transformed down to 550 for tramway service; on the transformer panel there is a watt-hour meter, a power-factor meter, and an ammeter. The voltage is transformed down to 110 volts for those instruments through potential transformers. The watt-hour meter will work all right on full load, but when the load is light it starts to run backwards. Why is this? Please also state if a 50-cycle power-factor meter will work satisfactorily on a 25-cycle circuit.—W. M.

(Answers must be received not later than first post Thursday, March 4th.)

ANSWERS TO No. 1,429.

When the triple-pole switch of a 20-h.p., 3-phase, 40-cycle, 550-volt motor is put in, the motor frame is "alive" (flashing it to earth gives a very visible spark), but when the rotor starter is moved to the first step, and the motor starts up, the frame ceases to be "alive," and remains "dead" as long as the machine continues to run. When the stator windings are tested with a "megger" the insulation resistance to earth is 15 megohms. What is the cause of this? "Erth."

The first award (10s.) is given to "C. S. B." for the following reply:—

"Erth" states that the insulation resistance of the stator windings to earth is 15 megohms. This is a very satisfactory value for a 20-h.p. 550-volt motor, and the fact that the frame is "alive" when the triple-pole switch is closed is certainly not due to any leakage from the stator windings. The insulation resistance of the rotor is not stated. The fact that a spark is seen when flashing the frame to earth may be explained as follows:—The motor is on a fairly highly insulating bed, and there is possibly a leakage from the rotor windings or slip-rings to the shaft—some motors have one slip-ring uninsulated. When the stator switch is closed, the pressure induced in the rotor windings will be approximately 200 volts, and if there is any leakage to the frame the whole motor will be statically charged above earth potential, with the result that a spark will be obtained when flashed to earth. As soon as the rotor starts to revolve, the induced pressure drops rapidly and the effect is no longer noticeable. The motor frame should be connected to earth by a 7/16 S.W.G. copper cable, which will entirely prevent any static charging effects.

The second award (5s.) is made to L. FOXES, who writes as follows:—

If "Erth" tests the rotor insulation resistance of the motor in question, he will probably find that it is defective, and this accounts for the frame of the machine becoming alive when starting up. When an alternating-current motor with a slip-ring rotor is switched on to the line with its rotor at rest, the slip between the rotating field due to the stator and the rotor conductors is a maximum, and therefore the E.M.F. generated in the rotor is a maximum; but as the rotor

increases in speed, so the slip, and with it the rotor E.M.F., become less, until when full speed is reached the slip is only very slightly below that of the rotating field and the E.M.F. across the rotor windings is practically zero, and the ends may be connected together; this is usually done by a proper short-circuiting device which connects all the slip-rings together and earths them with the rotor windings to the shaft of the motor. It will be obvious that any defect in the rotor insulation will be only apparent at starting and at low speeds, but will vanish as the rotor reaches full speed. The frame of the motor should be permanently earthed, otherwise one may receive a severe shock from a machine with defective insulation. If this is a new machine, or if it has been idle for some time, the rotor may have got damp. If the insulation is not zero, the rotor should be thoroughly dried to see if it will improve, and this should be done at once if possible, and before the frame is permanently earthed, as this would probably cause a complete breakdown of the rotor insulation when starting up.

ANSWER TO CORRESPONDENT

"SPEED REDUCTION."—The reduction of load on the motor would roughly be proportional to the reduction in diameter of the driven pulley, assuming that the machines call for the same torque at the reduced speed. In like manner the speed of the lightly loaded shaft can be increased by altering the size of the pulley roughly in proportion to the increase of power allowable on its motor. The pull on the belt in pounds when a certain h.p. is being developed = $H.P. \times 33000 / \pi d^2$ where n is the speed in r.p.m. and d is the diameter of the motor pulley. With regard to the fusing current for different sizes of fuses, this depends chiefly on the diameter of the fuse wire, as the length of the break provided does not affect the fusing current except in so far as it influences the cooling of the wire by the terminal blocks.

ELECTRIC TRACTION NOTES

The directors of the London & South Western Railway Co. in their report for last year state that the electrification of suburban lines has, notwithstanding various difficulties, made steady progress. The main power-house at Wimbledon and sub-stations are practically completed so far as the buildings are concerned, and the machinery is being erected. Some of the rolling stock is also practically complete, and the permanent way of the first section from Waterloo to Kingston is well in hand.

The accounts of the Underground Electric Railways Company of London for the second half of 1914 show a balance of £98,441 after meeting interest on the various classes of debenture stocks and bonds. It is pointed out that the passenger earnings of some of the companies in which the Underground Company is largely interested have been adversely affected by the conditions in London since the war, whilst there has also been an increase in expenditure due to increased wages and cost of material. The enlargement of the tunnels of the City & South London Railway has been postponed owing to the present conditions of the money market.

For more than twelve months the L.C.C. and the Islington Assessment Committee have been at action with regard to the assessment of the tramways in Islington. In 1912 and 1913, owing to the competition of motor-omnibuses, the gross receipts from the L.C.C. tramways in Islington fell from about 11½d. to 9d., and the L.C.C. requested the Assessment Committee of Islington to prepare a valuation of the tramways for rating purposes on the basis of the reduced revenue. This application was refused, and the case has now gone right through to the House of Lords. The argument against the L.C.C. was that the reduction in the revenue referred to did not come within the Valuation (Metropolis) Act of 1869. The Divisional Court decided in favour of the L.C.C., but the Court of Appeal reversed this decision. The House of Lords has now decided in favour of the L.C.C. .

In an action against the Dublin United Tramways Co. last week, a Mrs. Fosbery, the wife of an official of the National Bank, Dublin, was awarded £1,100 damages. The original claim was for £4,000, and the accident in respect of which the action was taken was caused by the plaintiff falling over the shafts of a lorry belonging to the Tramways Company, which, it was alleged, had not been properly lighted, and severely injuring her face.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Feb. 18th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

28,421/13. Dimming Lampholder. R. Dor (Japan). Lampholders containing a dimming switch with a resistance in several steps mounted within the barrel of the switch. The rheostat is actuated by turning a knob on the projecting spindle of the barrel. (Five figures.)

29,756 and 29,757/13. Cables. J. F. WATSON and CALLENDER'S CABLE & CONSTRUCTION Co., LTD. The first of these specifications covers the filling of the interstices of impregnated paper-insulated cables with oil to increase the dielectric strength and to decrease the dielectric loss, and the second describes a method of carrying this out by exhausting the air from the cable at one end and forcing the oil in at the other. (One figure.)

29,759/13. Driverless Railways. K. E. STUART (*British and Colonial Pneumatic Tube & Transport Co.*). An alternating-current system of working trains for conveyance of mails, &c., with interlocked sectionalised conductor rails with different supply voltages on different sections to obtain speed variation and auxiliary D.C. conductor rails at certain points for control purposes. (Ten figures.)

1,877/14. Moving Coil Instruments. R. D. GIFFORD and NALDER BROTHERS & THOMSON, LTD. The moving coil in a meter or other instrument, instead of having the current conveyed to it by rubbing or flexible contacts, carries the secondary of a transformer on the moving system in which the current is induced by a suitable fixed primary.

2,740/14. Wireless Telegraphy. R. C. GALLETTI. A method of producing unidirectional impulsive discharges, consisting in coupling a primary circuit containing a discharger, the discharge from which has a tendency to become unidirectional, with a secondary circuit, by a very tight coupling, changing the constants of one of the circuits until the oscillating discharge is transformed into a unidirectional impulsive discharge, and changing the constants of the primary or secondary circuits or of the circuit supplying energy to the primary circuit with the ratio between the current in the secondary circuit, and the current in the primary circuit becoming a maximum within the range of unidirectional discharge.

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Arc Lamps: GIRARDEAU [Automatic regulation] 7,451/14; HUGHES [Interchangeable carbon holders] 20,999/14.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: LONGBOTTOM & FARRAR [Conduit tube joints] 4,525/14; B.T.-H. Co. (G.E. Co., U.S.A.) [Protective devices] 4,931/14.

DYNAMOS, MOTORS, and TRANSFORMERS: LEITNER [DYNAMOS] 2,327/14.

Heating and Cooking: BERRY [Heating apparatus] 2,604/14.

Ignition: LONGFORD, LONGFORD and CLARK [Sparkling plugs] 6,800/14.

Incandescent Lamps: GLADITZ [Diamond dies for wire-drawing] 26,353/13.

Storage Batteries: FORD, 10,100/14.

Switchgear, Fuses, and Fittings: SCHWEITZER & CONRAD [Fuses] 3,696/14; PARKINSON, RAILING and GARRARD [Multiple fuses] 20,695/14.

Telephony and Telegraphy: AUTOMATIC TELEPHONE MANUFACTURING CO. (AUTOMATIC ELECTRIC CO.) [Telephone systems] 2,543/14; DUDFIELD [Preventing interruptions on telephones] 5,131/14.

Traction: B.T.-H. CO. (G.E. CO., U.S.A.) [Car lighting] 4,813/14; GLYN [Trolley wires] 6,977/14; RENAULT [Headlights] 15,052/14; HENDERSON [Electrically controlled change-speed gear] 17,885/14; VANDERVELL [Switchboards for motor-cars] 22,176/14.

Miscellaneous: THORNTON [Electric bells] 2,808/14; MORRISON [Electric clutch] 3,455/14; SCHNEIDER [Remote control of guns] 5,966/14; B.T.-H. CO. and DAVID [Control of winding gear] 6,351/14; MAGINI [Roentgen-ray generators] 7,926/14; MELLERSON-JACKSON (INTERSTATE NOVELTY CO.) [Battery lamps] 11,942/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

DYNAMOS, TRANSFORMERS, &c.: VAN SWAAY [Transformers] 484/15.

DISTRIBUTION SYSTEMS, CABLES, &c.: HOCHSTADTER [Stranded cables] 1,234/15.

TELEPHONY AND TELEGRAPHY: WAGNER [Insulation of telephone cables] 1,346/15.

TRACTION: MASCHINENFABRIK OERLIKON [Electric engine-starters] 180/15.

MISCELLANEOUS: DEUTSCHE TELEPHONWERKE GES. [Detonator for electric waves] 15,881/14; WUILLOT [Combined mechanical and electrical devices] 190/15; CONRAD [Starting electrodes for vapour electric devices] 1,468/15.

Amendments Made

11,091/13. Manufacture of Nitrides. SOC. GENERALE DES NITRURES. This specification, which is for a process of manufacturing nitrides of alumina, &c., in a continuous electric furnace of special design, has been amended by way of disclaimer.

Opposition to Grant of Patents

11,177/13. Telephony. E. R. CORWIN. Opposition to a grant on this specification, which describes a semi-automatic telephone exchange system, has been withdrawn.

26,764/13. Conduit Grip. J. R. A. HEMMING. A grant has been allowed on this specification in spite of opposition. It describes a continuity grip in which a set screw through a lug in the socket has a portion of its thread cut away in boring out the socket, so that a quarter turn is sufficient to cause it to engage with the tube when inserted. This grip was described in ELECTRICAL ENGINEERING, June 18th, 1914, p. 351.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:-

3,972/01. Lead Covering of Cables. E. A. CLAREMONT and S. STRATTON. This specification describes improvements in the construction of the cores and dies of presses for making pipes and covering cables with lead.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: A. E. WOODHOUSE [Flexible metallic casing] 25,577/09.

DYNAMOS, MOTORS and TRANSFORMERS: B. G. LAMME [Single-phase commutator motor with preventive resistances] 23,057/03; B.T.-H. CO. [Rotary converters] 24,336/06; M. C. LATOUR [Variable-speed A.C. motors] 23,916/07; A.E.G. [Commutator motors] 24,135/07; W. P. DURTNALL [Control of A.C. motors supplied by variable frequency alternators].

Electrochemistry and Electrometallurgy: B. SCHMELZER [Metallurgical furnaces] 18,523/08.

Incandescent Lamps: WOLFRAM LAMPEN A.G. [Decarbonising metal filaments] 24,028/07; B. T.-H. CO. and H. H. NEEDHAM [Binder for tungsten filaments] 23,726/08; C. G. REDFERN (COMPAGNIE GENERALE D'ÉLECTRICITÉ) [Attaching filaments] 25,383/09.

Switchgear, Fuses and Fittings: O. KJELLBERG [Relay switches] 22,612/07.

Telephony and Telegraphy: S. P. WILLIAMS [Telephone call meter] 24,165/07; H. VON KRAMER [Telephone system] 25,407/09; H. G. MATTHEWS [Wireless telephony] 25,639/09.

Miscellaneous: J. R. BAKER [Vapour electric apparatus] 22,964/04; A. K. T. SMITH [Electromagnet producing reciprocating motion] 25,144/09.

"ELECTRICAL ENGINEERING" TRADE SECTION

CATALOGUES, PAMPHLETS, &c., RECEIVED

ELECTRIC VEHICLE CHARGING SIGNS.—A leaflet from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), gives prices and particulars of several sizes and varieties of the special illuminated sign for charging stations or garages where charging facilities are provided for electric battery vehicles which has been standardised by the Electric Vehicle Committee.

FITTINGS, &c.—A new list of electric light fittings has just been issued in the convenient octavo form volume of 276 pages, by Simplex Conduits, Ltd. (116 Charing Cross Road, W.C.). A very wide and varied collection of brackets, pendants, electroliers, ceiling fittings, table standards, and other fittings are illustrated, and as a preface there is an interesting note upon design as applied to electric light fittings. A number of pages are devoted to shop window and outdoor signs, and a considerable range of silk and other shades and glassware is listed. We are pleased to notice that a full range of plain conical opal shades is included, in view of the difficulty there has been lately in obtaining these. A section at the end of the volume deals with electric heating and cooking apparatus.

IRONCLAD CIRCUIT-BREAKER.—Several patterns of circuit-breakers in cast-iron cases are contained in a new leaflet from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.). Some of these are in flame-proof cases with wide machined flanges for use in fiery mines. Ammeters can be attached. The breaker is of the Company's well-known "Salford" pattern with loose handle feature, and it is interlocked with the lid of the case, which can only be opened when the breaker is out.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

METAL FILAMENT LAMPS.—The British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), has issued a new leaflet with prices of Mazda drawn-wire lamps, including the ordinary sizes for high and low voltages, high c.p. lamps, and special lamps such as candle, tubular, sign, and traction lamps.

ELECTRIC FIRES.—The Cressall Manufacturing Co. (40 and 41 Staniforth Street, Birmingham) have issued a list of "Best" electric fires. These include some very elegant designs indeed, and some specimens of the actual apparatus which we have seen reveal perfect finish and workmanship. The Cressall woven glowing resistance strip is used as the heating element.

FITTINGS.—Verity, Limited (31 King Street, Covent Garden, W.C.), have issued a new edition in octavo book form of their electric light fittings catalogue, and a very handsome and well-illustrated volume it is. The range included is so complete that it is impossible to particularise all the classes of fittings dealt with, and indeed even all the novelties. The company emphasises that all the fittings are of their own design and are British in origin in every way. A special feature is the series of hospital fittings, which is very complete, and among the artistic interior fittings we may call attention to a beautiful series of brackets for semi-indirect lighting with real Wedgwood willow pattern screens. Designs to harmonise with every style of decoration are included, and shades, glassware, and accessories are listed separately in profusion.

CALENDAR.—We have received an office calendar from Flowerdew & Co., technical translators, 14 Bell Yard, Temple Bar, W.C.

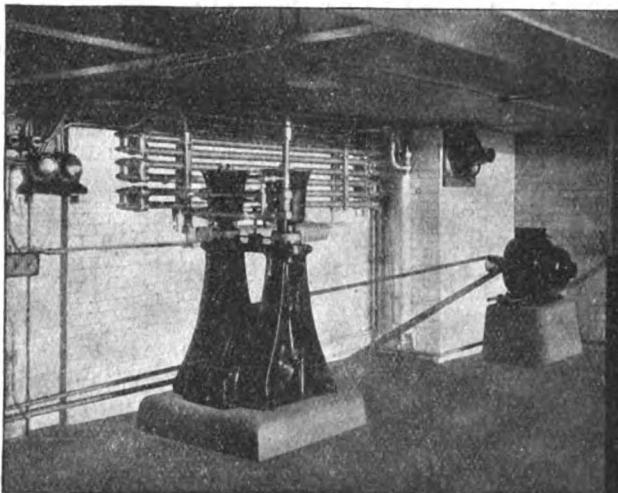

LUNDBERG'S ELECTRIC LIGHT SWITCHING COMPETITION

THE names of those competitors who were successful in passing the examinational tests published in our December issues are given in full on another page. Considering the war, and the large number of young engineers who have responded to the call for their services, the results may be described as entirely satisfactory. We are informed by Mr. W. Perren Maycock, who acted as Examiner on behalf of Messrs. A. P. Lundberg & Sons, that the quality of the Papers was above the average of previous competitions, and we congratulate the successful competitors.

Answer Papers from readers in distant countries may still be sent in, and will be eligible for certificates (but not prizes) if they reach us by June 1st next.

ELECTRICAL REFRIGERATION

THE use of electric motors for driving refrigerating plant is rapidly increasing, as much on the ground of reliability as of economy, and a case where electric motor drive has given satisfaction from this point of view is presented by an installation of the Path-head and Sinclair Town Co-opera-

8-h.p. "WITTON" MOTOR DRIVING AMMONIA REFRIGERATING PLANT AT KIRCALDY.

tive Society, Ltd., Kircaldy, where a 8-h.p. Witton motor is driven by a belt on to the flywheel of a "Hercules" ammonia compression machine. The Society has written the following letter on the subject:—

"The motor with the starting panel was supplied by the General Electric Co., Ltd., and has never given any trouble whatever since the plant was installed some six years ago. It is not an uncommon occurrence to have trouble with motors driving direct on to refrigerating compressors which are single-acting, as a maximum load takes place on the first two or three strokes, and it is often necessary to fit fast and loose pulleys on the compressors in order to allow the motor to get up to speed before putting on the load of the compressor. The motor, however, has never shown any hesitation in starting up at any time, nor has the starting rheostat given any trouble."

HALF-WATT LAMPS AND FITTINGS

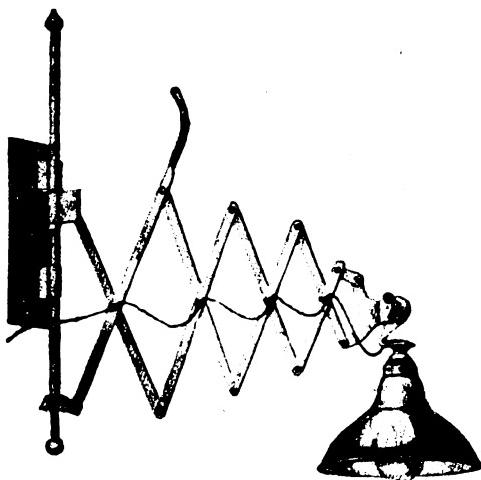

THE intrinsic brilliance of half-watt lamps is too great for them to be used for the older open, direct methods of lighting, and their employment, originally on the score of economy, has led to the wider adoption of indirect and semi-indirect methods of illumination, by which the quality as well as the efficiency of the lighting is improved. A fine example of indirect lighting by half-watt lamps is to be found in the new provision annexe of Selfridges, which is lighted by half-watt lamps in B.T.-H. "eye-rest" fittings, giving a fine effect. Now that half-watt lamps are available in considerable quantities for prompt deliveries, increasing attention is likely to be paid to this form of lighting, lamps and fittings for which are a speciality of the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.).

The Enemy's Trade.—The Commercial Intelligence Branch of the Board of Trade continues to receive numerous inquiries for the names of sellers or buyers of articles of which the sources of supply or markets have been interfered with by the war. This Branch is now issuing lists of such articles weekly. Those interested should apply to 73 Basinghall Street, E.C.

German Firms in France.—*La Lumière Electrique* publishes a list of 77 electrical and engineering firms owned wholly or partly by Germans or Austro-Hungarians, which have been put under Government receivership. Some very well-known names are included.

AN ADJUSTABLE FITTING

THE fitting illustrated here, which has recently been introduced by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), is particularly suitable for business offices, drawing offices, &c., where a wide range of adjustment of position is desired. By a "lazy tongs" action the

LAZY-TONGS ADJUSTABLE BRACKET.

projection is adjustable between 8 in. and 32 in., and there is a horizontal swivelling action within a semi-circle. The angle of the reflector is also adjustable, as shown by the wing nut provided. By means of the curved extension of one of the arms of the lazy tongs, which can be hooked on to the wall pillar, the light can be raised to a fixed point 27 in. above the normal position. The fitting, which is the subject of Patent No. 15,607/13, is made of polished brass.

EXPERIENCES WITH HALF-WATT LAMPS

WE have received the following letter from Mr. F. C. Morris regarding the life of half-watt lamps in actual use:

I beg to enclose a report relating to the life of four 1,000 c.p. 500 watt half-watt lamps.

At our steel works (John Booth & Sons, Hulton Steel Works, Bolton), we have had continually, during the past twelve months, a day and night shift, and these lamps have been fixed at a height of 35 ft. from the ground. The light is extremely satisfactory, the chief advantage being that the cranes are kept continually at work, there being no need to stop them, which was a common occurrence when trimming arc lamps.

Life of two Half-watt Wotan Lamps, 115 volts, 500 watts (in series).—Fixed April 6th, 1914 : April 6th, 1914, to Aug. 1st, 480 hours; Aug. 15th to Oct. 1st, 230; Oct. 1st to Dec. 30th, 560 hours. Total burning hours, 1,270. One burnt out Dec. 30th, 1914.

Two Half-watt Wotan Lamps, 115 volt, 500 watt. (Series fixed May 13th, 1914).—May 13th to June 8th, 108 hours; June 11th to Aug. 1st, 180 hours; Aug. 18th to Oct. 1st, 230 hours; Oct. 1st to Dec. 30th, 560 hours; Jan. 1st to Feb. 15th, 380 hours. Total burning hours, 1,458. These are still in use.

Arrangements for the Week.—(To-day) Thursday, Feb. 25th.—Institution of Electrical Engineers. "Electricity Applied to Mining," by C. P. Sparks. 8 p.m.

Friday, Feb. 26th.—Physical Society. At Imperial College of Science, South Kensington. "The Electrification of Surfaces as Affected by Heat," by Dr. P. E. Shaw. 5 p.m.

Saturday, Feb. 27th.—Association of Mining Electrical Engineers. South Wales Branch. Carlton Café, Queen Street, Cardiff. "Typical Breakdowns in Colliery Electrical Plant and their Prevention," by Ll. Foster. 6 p.m.

Monday, March 1st.—Institution of Electrical Engineers, Newcastle Section, Mining Institute. "Electricity Applied to Mining," by C. P. Sparks. 7.30 p.m.

Wednesday, March 3rd.—Institution of Electrical Engineers, Birmingham Section. At University. "Electricity Applied to Mining," by C. P. Sparks. 7.30 p.m.

Institution of Electrical Engineers. Students' Section, at Victoria Embankment. Discussion on "The Application of Electrical Engineering to Warfare." 7.45 p.m.

Thursday, March 4th.—Greenock Electrical Society. 21 West Stewart Street. "The Operation of a Large Electric Supply System," by G. Macdonald.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Aberdare.—Twelve months' supply of cable, meters, joint-boxes, lamps, &c. March 6th.

Dover.—Twelve months' supply of cable and electrical sundries for the Harbour Board. March 9th.

London: Battersea.—The Finance Committee of the L.C.C. recommends sanction to the borrowing of £15,750 for mains, converting plant, and switchgear. Tenders have been invited for twelve months' supply of meters, joint-boxes, metal and carbon filament lamps, troughing, &c. Borough Electrical Engineer. March 2nd.

Stirling.—Extensions are to be carried out at the generating station, and Mr. J. A. Robertson, Borough Electrical Engineer at Salford, is to be consultant.

Swindon.—Twelve months' supply of meters, fuse- and service-boxes, &c. Borough Electrical Engineer. March 13th.

Wistaston.—Mr. H. H. Denton, Borough Electrical Engineer at Crewe, is to report to the Nantwich Rural District Council with regard to an electric lighting scheme for this district.

Wiring

Edinburgh.—Labour exchange, Grassmarket. City Electrical Engineer. March 4th.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Derby.—Infirmary (£35,000).

London: Wandsworth.—Coroner's court (£2,500).

Manchester.—Four public wash-houses (£16,000).

Nottingham.—Children's homes, &c. Architects, Vallance & Westwick, Mansfield.

Miscellaneous

Dundee.—Twelve months' supply of armature coils, commutators, carbon brushes, lamps, and other stores for Tramways Department. General Manager. March 3rd.

Leicester.—Incandescent electric lighting by 600-c.p. half-watt lamps has been recommended by the Watch Committee for certain tramway routes.

London: Islington.—Twelve months' supply of electrical fittings. Clerk, St. John's Road, Upper Holloway, N. March 9th.

Mile End.—Twelve months' supply of electrical fittings for the Guardians. Clerk, Bancroft Road. March 2nd.

Pontypridd.—Twelve months' supply of joint-boxes, cut-outs, tramway equipment, insulating material, meters, &c. Borough Electrical Engineer. March 18th.

Richmond (Ireland).—Twelve months' supply of electric lamps and fittings for the Asylum. Clerk, Grangegorman Annexe, Dublin. March 10th.

TENDERS RECEIVED AND ACCEPTED · AND ORDERS PLACED

The General Electric Co. of China has secured the contract for all the Government requires for Osram lamps and electrical supplies for Hong Kong for 1915.

The Edison & Swan United Electric Light Co. has received a contract for Royal Ediswan metal and carbon filament lamps from the Booth Steamship Co.

APPOINTMENTS AND PERSONAL NOTES

Mr. H. W. Miller has been appointed Managing Director of the Kensington & Knightsbridge Electric Lighting Co. in succession to Mr. R. W. Wallace, K.C., who has resigned.

We regret to record the death on Sunday of Lance-Corporal J. A. Donald, late of the Blackpool Electricity Works, who with two other members of the staff had joined the Royal Naval Division through the I.E.E. He died suddenly of myocarditis while on leave. We hear that there are now

64 members of the Blackpool electricity and tramway undertaking serving in H.M. Forces.

An Assistant Electrical Engineer is required by the Redditch District Council. Commencing salary £170 per annum. Town Clerk. March 11th.

Mr. W. J. Appleby, of Birmingham, has been appointed Shift Engineer at Watford at a commencing salary of £90 per annum.

A meter-room assistant is required at Stepney, a switch-board attendant at Ipswich, and carshed fitter at Swindon.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £59 5s. to £59 15s. (last week, £68 to £68 10s.).

Agencies.—An agent in Archangel desires to represent British manufacturers of electric lamps and fittings.—An engineer in Ekaterinoslav (Russia) desires to represent British manufacturers of motors and electric light plant.—A Christchurch (N.Z.) firm wishes to represent British manufacturers of small motors, dynamos, metal filament lamps, &c. Further particulars in each case at 73 Basinghall Street, E.C.

Liquidations.—A meeting of the Ebro Light & Power Construction Co. will be held at 232 Strand, W.C., on March 22nd, at 2 p.m., to hear the liquidator's account of the winding-up.

LOCAL NOTES

Aylesbury: Progress of Electrical Undertaking.—Considerable headway is being made with the Council's electric supply scheme. The engine foundations are in place, and the generating plant has been delivered. The Electric Lighting Committee has been advised that, in view of recent legal decisions, the supply by the Council of wiring and fittings cannot be undertaken, and the Resident Engineer has been instructed to report upon methods of dealing with the supply to small houses at a fixed price.

Barnes: Electric Cooking.—It has been decided to instal electric cooking apparatus in a number of the Council's workmen's dwellings. The cooker is to consist of a small oven and boiling plant. Prepayment meters will be used, and the charge for current will include 3s. 6d. per annum for the hire and maintenance of the apparatus.

Dover: Electrical Extensions.—Our contemporary, the *Dover Express*, is complaining of the proposed expenditure of £6,000 for extensions to the electricity undertaking, on the ground that the Chancellor of the Exchequer intimated, at the beginning of the war, that expenditures which could be avoided at present should not be incurred. It is difficult to see, however, how the increased expenditure at Dover on necessary extensions to the electrical plant comes under this heading, but, in any case, at the L.G.B. inquiry all the details of the proposal will be investigated into.

Dublin: Increased Charges.—We referred in our last issue to the fact that the Electricity Committee was to hold a special meeting to consider the question of increased charges owing to the extra cost of coal, &c. This meeting was held on Thursday, when it was reported that the increased expenditure during the next twelve months is estimated to be £20,000, of which coal is responsible for £15,000. The Committee, however, was reluctant to increase the charges to bring in this extra revenue, as the City Electrical Engineer believes that by postponing certain work and effecting changes in certain directions he will be able to meet a portion of this

extra cost. Eventually it was decided to recommend the Corporation to increase the lighting charges by ½d. per unit and the power charges by ¼d. per unit.

Hornsey: Electricity Deficit.—A resolution was moved at the last meeting of the Council that £2,750 should be taken for relief of rates from the surplus of £6,915 standing to the credit of the electricity undertaking. The mover of the resolution argued that as the undertaking had received in the early years of its existence £6,736 from the rates, it was time that some portion of this sum was repaid. The Chairman of the Finance and Electricity Committees, whilst agreeing that the undertaking was in honour bound to repay the sum received from the rates, did not think that the present was the most opportune moment, and eventually it was left to the two Committees to confer and bring forward a scheme later.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Companies Struck Off Register.—The names of the following have been struck off the register of joint stock companies:—Electrical Power Users' Association, Ltd.; Electric Fire Prevention Appliances & General Manufacturing Co.; International Syndicate for Works Concessions, Ltd.; the Star Electric Light Co., Ltd.; British Wireless Telegraph Syndicate; Electrical Fittings Co.; and the National Electric & Motor Corporation, Ltd.

The names of the following will be struck off the register of joint stock companies at the end of three months unless cause is shown to the contrary:—Alkaline Accumulators Paul Gouin, Ltd.; County Electric Traction Co.; Electric Batteries and Carbons, Ltd.; Leeds Electric Co.; Southwold Electricity Works, Ltd.; and the Witney Electric Supply Co.

Bastian Meter Co.—A dividend of 2 per cent. on the ordinary shares is recommended for 1914.

Scarborough Electric Supply Co.—In their report for 1914 the directors express their regret at the loss sustained through the death of the Company's secretary in the bombardment of Scarborough by the German fleet at the end of the last year. A dividend of 2 per cent. is recommended on the ordinary shares.

South Metropolitan Electric Light & Power Co.—The net revenue for 1914 was nearly £1,500 more than in the previous year, notwithstanding the restricted lighting and general disturbance of business by the war. The directors indicate that they are not prepared to support the Power Bill promoted by the other London companies. The sum of £10,000 is added to reserve, and £5,591 carried forward. No dividend is declared on the ordinary shares.

Bruce Peebles.—There was a net profit for 1914 of £3,892 after meeting mortgage interest. No dividends are declared.

Tramways, Light & Power Co.—This Company, which took over the power companies working in Leicestershire, Warwickshire, Derbyshire, and Nottinghamshire, a short time ago, proposes to issue a further £100,000 in preference shares, bringing the nominal share capital to £700,000.

Chelsea Electricity Supply Co.—A dividend of 5 per cent. is recommended on the ordinary shares for 1914, the same as in 1913. A slightly larger allowance has been made for depreciation, and the sum of £3,196 is carried forward as against £2,765.

Bournemouth & Poole Electricity Supply Co.—The recent issue to shareholders of 2,500 cumulative 6 per cent. second preference shares was largely over-subscribed.

Charing Cross, West End & City Electricity Supply Co.—A 5 per cent. dividend on the ordinary shares for 1914, as in 1913, is recommended.

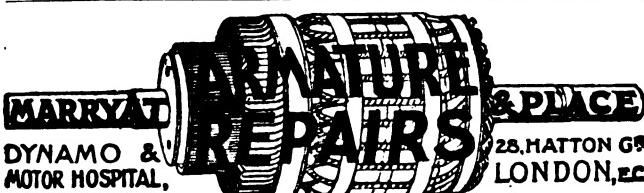

County of London Electric Supply Co.—A dividend of 7 per cent. is declared on the ordinary shares for 1914, the same as in 1913. £40,000 has been placed to depreciation and £10,000 carried forward.

NEW COMPANIES

DERBY LAMP WORKS, 9-10 Pancras Lane, E.C. Capital £85,000 (16,500 profit participating cumulative preference shares of £1 each, and 274,000 ordinary shares of 5s. each). Two directors are to be nominated by the liquidator of Metalite, Ltd.

ELECTRIC LAMP FACTORS.—Registered by Farrar, Porter & Co., 2 Wardrobe Place, Doctors' Commons, E.C.

SOCIETE ANGLO-BELGE D'EXPORTATION, 14 Great Smith Street, Westminster, S.W. Capital £5,000. Merchants and importers and exporters of electrical and other merchandise. The directors include R. W. Blackwell and Philip Dawson.

SUMMARY

AN interesting and important action is now being heard before Mr. Justice Warrington in the Chancery Division, in which the Robin Electric Lamp Co., Ltd., is seeking a compulsory licence under Section 24 of the Patents Act of 1907. The object is to manufacture drawn tungsten wire under certain patents owned by the British Thomson-Houston Co. and Messrs. Siemens Bros. Dynamo Works, as it is alleged that these companies have refused to supply the Robin Electric Lamp Co. with wire on reasonable terms (p. 90).

ATTENTION was called by Sir John Snell at the last meeting of the Institution of Electrical Engineers that Mr. C. P. Sparks has a brother and three sons serving at the Front. His youngest son has been mentioned in despatches and awarded the Military Cross (p. 91).

IN a paper read at last Thursday's meeting of the Institution of Electrical Engineers and also at several of the Local Section meetings, Mr. C. P. Sparks gave a detailed description of the electrical equipment of the Powell Duffryn Collieries, South Wales, commenting on a number of matters connected with electricity applied to mining, especially as regards earthing connections, and colliery bell signalling (p. 91).

AT a recent meeting of the Association of Mining Electrical Engineers, Mr. W. Maurice read a paper on colliery electric lamp rooms (p. 93).

IN a recent lecture, Mr. V. Stobie urged that a finer quality of steel could be produced by treating the product of a basic open-hearth furnace in an electric

furnace than direct by the acid open-hearth process at an increased cost of only 1s. 6d. per ton (p. 93).

A PAPER by Mr. J. Bowman, read recently in Scotland, deals with electricity at the coal face (p. 93).

AMONG the subjects of electrical patents of interest to mining electrical engineers published during the past month are electric miners' lamps, prevention of sparking from bells, and the control of winding plants, and two patents relating to electric furnaces (p. 93).

SOME typical examples of mining electric plant are illustrated on pp. 94 and 95.

THE third list of members of the Institution of Electrical Engineers on military service is published, bringing the total to 805. This list, as the second list already issued, includes many men from India and the Colonies (p. 95).

AMONG the specifications published by the Patent Office last Thursday was one for a water heater with interlocked switch and water-tap, and another for rendering the lighting of electric trains independent of fluctuations or interruptions of voltage. A decision has been given that the "Thermit" rail joint welding patents, which are enemy-owned, may be "avoided." Opposition has been entered to two patents for motor control and grid resistances. Patents for intercommunication switches and contacts for radiator lamps expire this week after a full life (p. 96).

THE starting of rotary converters is dealt with in our "Questions and Answers" columns (p. 97).

TWO articles in our Trade Section deal with the use of the Edison battery for electric vehicles (p. 98).

A NEW power station is contemplated at Blackburn; a 1,000 kw. turbo-alternator is required at Dover; a 5,000 kw. set at Hull; new plant at Newcastle-on-Tyne; and an extension scheme estimated to cost £200,000 is to be put in hand at Leeds. General supplies of cable, meters, carbons, etc., are required by a number of authorities (p. 99).

A FIRE at Rotherham last week resulted in the high tension power supply being shut down for a short time.—A large supply for an electro-chemical industry is to be given at Stoke-on-Trent at ½d. per unit.—A scheme for lighting small property on a fixed weekly charge has been devised at Coventry.—The Dublin Electricity Committee has been compelled to raise its charges for lighting by another ¼d. per unit and for power by another ½d. per unit (p. 100).

IT has been decided not to hold the usual Convention of the Incorporated Municipal Electrical Association this year. Two business meetings, however, will be held on June 17th and 18th in London (p. 100).

(For Arrangements for the Week see p. 99.)

Coal Supplies.—A deputation of managers of electricity and gas works in London was received by the President of the Board of Trade yesterday. The Press was not admitted.

DRAWN WIRE LAMP FILAMENTS Compulsory Licence Applied for

THE hearing of an interesting application for a compulsory licence to manufacture drawn-wire filament lamps was commenced before Mr. Justice Warrington in the Chancery Division on Tuesday.

This is the first application for a compulsory licence under Section 24 of the Patents Act of 1907 which has been remitted to the High Courts. The section in question provides for the granting of compulsory licences or in the alternative the revocation of a patent, where it can be proved that the reasonable requirements of the public have not been satisfied by the holders of the patent. This is deemed to have been the case if any existing trade or industry, or the establishment of any new one in the United Kingdom, is unfairly prejudiced owing to the patentee not having manufactured adequately or being unwilling to supply on reasonable terms and conditions.

The present action is at the instance of the Robin Electric Lamp Co., Ltd., against the British Thomson-Houston Co., Ltd., and Siemens Bros. Dynamo Works, Ltd. Counsel engaged in the case are Mr. Bousfield, K.C., Mr. Cave, K.C., and Mr. Frost for the Robin Electric Lamp Co.; the British Thomson-Houston Co. is represented by Mr. A. J. Walter, K.C., Mr. J. Hunter Gray, and Mr. Lunge; whilst Messrs. Siemens Bros. Dynamo Works are represented by Mr. A. H. Colefax, K.C., and Mr. Hume.

In opening the case Mr. Bousfield, K.C., explained that Mr. Robin, the owner of Patent No. 6,856 of 1911, which relates to a double filament incandescent lamp, seeks a compulsory licence under the following nine patents relating to drawn tungsten wire owned by the British Thomson-Houston Co. and Messrs. Siemens Bros. Dynamo Works:—20,277/04, 3,174/07, 19,932/08 (Siemens), 21,513/06, 16,530/07, 23,499/09, 2,759/10, 8,031/10, and 17,722/11 (B.T.-H.). These firms, he added, together with the Osram Lamp Works, Ltd., had pooled all their patents, which were generally admitted to be the fundamental patents, amounting to some 150 or 200, relating to the manufacture of drawn tungsten wire. In July, 1912, Mr. Robin communicated with Messrs. Siemens Bros. Dynamo Works with regard to the manufacture of lamps under his patent. This lamp contains two independent filaments, of the same size, connected to two pairs of contacts in the cap, and by an ingenious arrangement of a ring round the cap (which is of special shape) the lamp can be turned in the holder should one filament break, and is thus given a new life. Messrs. Siemens offered to make the lamps on the understanding that the retail price was one shilling more than the present list prices fixed by the Tungsten Lamp Association for ordinary single filament lamps, of which the three firms mentioned above, and all their licensees, are members. This offer was considered exorbitant, and Mr. Robin decided to undertake the manufacture of his lamp himself. Consequently in December, 1912, the Robin Electric Lamp Co. was formed, and Messrs. Siemens were then asked to quote for supplying 20,000 metres of drawn tungsten wire per month suitable for these lamps. Messrs. Siemens having refused to quote, however, a request was again made for a quotation on reasonable terms or that a licence should be granted, but neither suggestion was acceded to. A similar application was then made to the B.T.-H. Co. after the matter had been placed in the hands of the Robin Electric Lamp Co.'s solicitors. The B.T.-H. Co. offered to supply wire at 12s. per thousand feet for 25- to 100-watt 100-volt filaments, and 15s. per thousand feet for filaments for less than 25- and over 100-watt 100-volt. This was regarded as an extraordinary price, as the Robin Co. had received an offer from a Swiss firm to supply similar wire at 14s. per thousand feet, which was equivalent to ½d. per lamp, whereas the prices quoted by the B.T.-H. Co. would increase the cost of the Robin lamp by 5d. in the case of a single filament lamp or 10d. in the case of the double filament lamp under the Robin patent.

Mr. Bousfield then dealt with the effect on the price of tungsten filament lamps in this country due to the operations of the Tungsten Lamp Association. Lamps identical with those now being sold in this country at from 2s. 6d. to 2s. 9d., he said, were being sold abroad to the public at 10d., and it was clear from what had taken place in the present case and from the differences in the prices in this country and abroad that the sole object of the Tungsten Lamp Association was to force every lamp manufacturer into the ring in order to keep the prices up against the public. Obviously if the owners of the Robin patent obtained a supply of drawn tungsten wire upon reasonable terms, it could be placed upon the market at a price which would very seriously

compete with the lamps sold by the members of the Tungsten Lamp Association, and clearly it was for this reason, he said, that the Robin Co. had been refused either a supply of wire on reasonable terms or a licence to manufacture the wire itself. As to the difference between the price of a single and a double filament lamp, he suggested that 3d. was all that need be added to cover the extra cost of the filament and manufacture, whereas the effect of the terms offered by the B.T.-H. Co. would be to increase the price by 1s.

Passing to a consideration of Section 24 of the Patents Act, Mr. Bousfield contended that the Robin Co. was entitled to a supply of drawn tungsten wire *per se*, and that the owners of the drawn-wire patents had no right to inquire as to the use to which it was to be put. It was clear that the "reasonable requirements of the public" were not being met by the owners of the patents, as they refused to supply anybody outside the Tungsten Lamp Association, except upon prohibitive terms. The refusal to supply the Robin Co. with wire was that the trade of the Robin Co. was "unfairly prejudiced by the conditions attached by the patentee" in the words of Section 24.

Mr. Justice Warrington suggested that the wording of the Act might mean that the reasonable requirements of the public must be met, and not the requirements of any one individual.

Mr. Bousfield referred to Section 5, Sub-section (a), of Clause 24 of the Act, which referred to the establishment of any new trade. The Robin Co.'s business was a new trade, and it would be for the judge to decide what was a fair royalty to be paid.

Mr. Justice Warrington: How am I to do that?

Mr. Bousfield said it could only be arrived at by the consideration of the cost of manufacture of the wire by the patentee, and in the absence of precise information to this effect, which he did not suppose the patentees would give, the judge could only give such a decision as would be a guide in arriving at what would be a fair royalty.

Evidence for the Robin Lamp Co. occupied the whole of Tuesday and part of yesterday. Mr. C. D. Falcke, the secretary, and Mr. Robin, the patentee, said that they desired to obtain the wire or even to have the lamps made for them in this country if they possibly could, but they would manufacture both the filament and the lamp if they could not be obtained from other manufacturers at a reasonable price, or import the lamps and pay a royalty. Quotations had been obtained elsewhere for the supply of wire, all much lower than the B.T.-H. price. Duram, Ltd., had quoted 38s. 7d. per 1,000 ft., a Stockholm firm 29s. 9d., a French firm 43s. 2d., and two German firms 37s. 4d. and 12s. 9d. respectively, the last price being for very large quantities. The Robin Co. had also had sample double filament lamps with squirmed filaments made by Cryselco, Ltd., in 200 lots at 1s. 4d. each lamp for low voltage, and 1s. 6d. for high voltage, and Messrs. Siemens had made some 105-volt tantalum at 1s. 6d. The manufacturers of the Serena lamp had offered low-voltage double filament lamps at 6d., and high-voltage at 9d. up to 50 c.p. Mr. Robin said that his own personal opinion was that a reasonable retail price would be about 3d. above the prices fixed by the Tungsten Lamp Association for single filament lamps. The capital of the Robin Co. is £25,000; 10s. per share has been called up on 10,350 £1 shares, and the actual cash balance available at the moment is about £2,000.

Mr. Falcke referred to an estimate of £25,000 for a lamp factory for turning out 2,000,000 lamps per annum, whilst Mr. Robin said he had been offered a complete plant in Paris for the manufacture of drawn tungsten wire at £2,000, the capacity being 5,000,000 metres per annum. It was suggested in cross-examination that this plant was the property of a manufacturer who was being proceeded against for infringement, and that the estimate for the complete lamp factory was hopelessly low.

Evidence was also given by Mr. S. Biheller, an importer of lamps and component parts from abroad. He said he could buy wire for low-voltage lamps at 6s. per 100 metres, glass bulbs at 33s. per thousand, and glass supports at 4d. per lamp, the caps at 20s. per thousand, and adding the cost of the leading-in wires, &c., the total cost for labour and material came out to something under 4d. per lamp. He could buy lamps similar to those quoted at 2s. 2d. in the Association's list at 6d. for re-sale abroad, and those quoted at 2s. 8d. for 9d. or 10d. The standard retail price in Germany for the lamp listed here at 2s. 2d. was 1s. 1½d., and in Canada 1s. 8d., and Australia 1s.; and for that listed at 2s. 8d. it was 1s. 9d. in Germany. Mr. Walter, in cross-examination, reminded witness that his figure of 4d. as the cost of a lamp did not include overhead charges, selling charges, advertisements, management, rent, rates, interest on capital, &c., and that the wire which he spoke of as buying at 4s. 6d. included nothing for royalty either in the country of origin or in this country.

Mr. T. Rose, of Rose Bros., Electrical Engineers, said that in Holland a single filament low-voltage lamp could be bought at 6d. wholesale, and a high-voltage lamp at 8d., the retail prices being 1s. and 1s. 3d.

ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Published on the First Thursday of each month

ELECTRICITY APPLIED TO MINING

A LONG and comprehensive paper with this title, by Mr. C. P. Sparks, was read at last Thursday's London meeting of the Institution of Electrical Engineers. It also formed the subject of discussion on Tuesday and Wednesday at the Western and Manchester Local Sections, and will be discussed at Birmingham on Wednesday next.

At the London meeting the President (Sir John Snell) said that before calling on Mr. Sparks to read his Paper he wished to refer to a personal matter, because he was sure they would all wish to join in offering congratulations to Mr. and Mrs. Sparks. Not only had Mr. Sparks a brother who took such an honourable part in the London Scottish charge in Flanders, and who had come back wounded—but who, he was glad to say, was now convalescent, and was looking forward to returning—but three of his four sons were serving their King. One was in the Royal Engineers, another was in the Artillery, and the youngest, a youngster of only 18½, who had so done his duty at the front that he had not only been mentioned in despatches, but had been awarded the Military Cross by His Majesty. He (Sir John) had only one son, and he was serving his King to the best of his ability, and he would be indeed proud of him if he could mention such a record. He was sure it must be of the greatest legitimate pride to Mr. Sparks and his wife to feel that their sons were doing such splendid work, and showing such a splendid example to the young men of this country.

Mr. Sparks said it was very difficult to find words to express the gratitude of his wife and himself for what Sir John Snell had said, and the way the members had received it. He was indeed proud of his three sons, who with so many hundreds of Englishmen were doing their duty, and he was specially proud of the young fellow who had been awarded the Military Cross.

The paper dealt principally with the electrical installation at the Powell Duffryn Collieries, South Wales, a concern raising coal at the rate of 4 million tons per annum, working over an area of 16,000 acres, and comprising 9 collieries in the Aberdare Valley and six in the Rhymney Valley. The electrical plant for the whole group aggregates 24,000 kw., with an estimated output for the present year of 62 million units. One colliery, the Britannia, is worked entirely electrically. Transmission in the Aberdare Valley is three-phase at 3,000 volts, in the Rhymney Valley at 10,000 volts, and from Aberdare to Rhymney at 20,000 volts. The frequency of 50 cycles was chosen in preference to 25, for reasons among which were the more convenient speed of the generators and greater possibility of speed variation on the motors. Discussing the relative merits of power supply from a company or separate generation, the author pointed out that the introduction of exhaust steam turbines and the possibilities of utilisation of coke-oven gas for power purposes had increased the field for the latter. In some cases joint working was advantageous. In any case, some spare plant at the collieries was desirable, and the Powell Duffryn Co. had met this by erecting as stand-by plant certain reciprocating engines displaced by more modern plant.

The scheme includes the following four generating stations :—Middle Duffryn (in the Aberaman Valley), with one 5,000-kw. and three 2,000-kw. high-pressure turbo-alternators; Penallta, with two mixed-pressure 3,000-kw. turbo-alternators; Bargoed, with two 1,600-kw. and one 800-kw. gas engine-driven sets, and a 2,000-kw. mixed-pressure turbo-alternator; and Elliot Pit, with two 500-kw. exhaust steam turbo-alternators. The last three are in the Rhymney Valley. In all cases, except Penallta, river water is available, but here the only source of circulating water is the pit. Exhaust steam (derived from existing steam winding engines and air-compressor engines) is used at three stations. The Rateau heat accumulator system is employed at Elliot and Penallta, but the Samuelson system, which employs a steam accumulator of the gasometer type, is used at Bargoed. It is

found that whereas the Rateau plant gives a back pressure of $2\frac{1}{2}$ to $3\frac{1}{2}$ lb. per sq. in., with the Samuelson system it never exceeds 0·5 lb. The mixed-pressure plant at Bargoed works in parallel with the gas-driven plant with a success that speaks well for the speed regulation of the plant under the changing steam conditions. Some particulars of the gas-engine plant and other details of the Bargoed and Penallta stations have already been given in ELECTRICAL ENGINEERING, Nov. 2nd, 1911, Mining Supplement, p. lxvii. Taking the whole scheme, about 14 million units are generated by coke-oven gas, about 14·5 million by exhaust steam, and 21·5 million by live steam. The load factor of the gas plant is kept high by putting it into the electric pumping plant load at night, and the average figure is 72 per cent. against 47 per cent. for the live steam plant.

The transmission lines are all bare copper lines on wooden poles. The 3,000-volt system in the Aberdare Valley is arranged as a ring main with Merz-Price protection, the pilot wires being in the form of three-core lead-covered cables slung from galvanised steel catenary wires. The 10,000-volt lines in the Rhymney Valley, $3\frac{1}{2}$ miles long from Bargoed to Penallta, is arranged so that the Britannia Colliery near the centre of the line can be supplied from either of the two power houses by two sets of duplicate transmission lines. From Bargoed to the new Tredegar and Elliot pits the line is worked at 3,000 volts, but ultimately the pressure will be increased to 10,000 volts. A connecting link between the Aberdare and Rhymney systems is to be made by a 20,000-volt line from the Middle Duffryn power house and the Britannia Colliery (9 miles), but by changing the transformer from mesh-star to mesh-mesh and cutting out a part of the neutral ends of the star winding, the pressure will ultimately be raised to 30,000 volts. This line will be on steel poles with a copper earth wire. The distribution underground has always been by multicore armoured cables, with the armouring earthed. In the case of important pumping plant, duplicate cables are used either on opposite sides of the shaft or where possible in separate shafts.

The author discusses the question of earthing connections in some detail, recapitulating the Home Office regulations and recommendations, and gives the results of some experiments on the subject. In general, earth connections made strictly on the official lines gave resistances too high to be satisfactory except where the conditions are very favourable, and in one case an earth connection of this character was such that had it been called upon to carry 500 amperes for a short period to enable a circuit-breaker to open, a potential of at least 500 volts above earth would have been produced. The contact area of the coke bed should, in his opinion, be materially greater than is specified in the Regulations, but compared with this the use of the metal plate was unimportant. His tests also show the desirability of burying the earth plates at considerable depth to avoid too great a potential gradient on the surface. With regard to earthing the neutral point of a three-phase system, the author is strongly of opinion that this should be made compulsory.

The switchgear in the Company's generating stations is described in the Paper. It follows the best standard up-to-date practice with its sectionalised ring bus-bars. The generators are protected by time-limit overload and reverse current relays, the feeders by time-limit overload, and the transmission lines by time-limit overload relays and the Merz-Price system. Extensive use is made in the newer stations of switch pillars on the floor level, carrying the operating gear for the oil switches in the cells below and the necessary instruments. Tirrill regulators are used to maintain constancy of voltage. The power factor varies from 0·7 to 0·85. The generators are rated to give their full output at 0·75, and, owing to the moderate distance of transmission, there has been no difficulty in maintaining the normal pressure at the individual collieries, but to deal with further extensions some of the larger motors will probably be fitted with power factor correctors.

One of the most interesting features of the whole installation is the pair of electric winders supplied by Siemens

Brothers Dynamo Works, Ltd., at the Britannia pit, with flywheel power storage on the Ilgner system. Each of these is designed to handle 390 tons of coal per hour from a depth of 730 yards. Two 30-ton flywheels are used on the converter set, and each winder is direct driven by two motors working up to 4,300 h.p. A full illustrated description of this plant was given in ELECTRICAL ENGINEERING in the article already referred to. During sinking each winder was worked with one motor and a parallel drum, but a cylindro-conical drum will replace these. An electric winder driven by a direct-coupled induction motor is in use at the Abercwmboi Colliery. The motor, of a normal rating of 375 h.p., works up to a maximum of 700 B.H.P. This winder was described in detail in ELECTRICAL ENGINEERING, Sept. 1st, 1910 (Vol. VI.), Mining Supplement, p. xciii.

A large number of electrically-driven pumps are used in the various collieries, many of which displace older steam pumps. All the large pumps are of the direct-coupled multi-stage type. The largest pumping station, at the Elliot Pit, contains, besides two other pumps, a six-stage Sulzer pump driven by a 1,000-h.p. slip-ring motor built into a turbo-alternator frame and provided with forced ventilation by electrically-driven fans drawing air through special filters. Most of the principal main ventilating fans are driven by induction motors by a rope drive allowing of the speed to be altered to meet change of requirements by altering the pulley ratio. A stand-by motor is usually provided. The fan at the new Britannia Colliery, in which a gradual alteration of speed is required to keep pace with the development of the colliery, is driven by an 850-h.p. continuous-current motor supplied through a rotary converter. The same system of drive is also used in the case of one of the air compressors at the same colliery, which is required to run at varying speed, but most of the compressors on the system are driven by constant-speed induction motors. With regard to electrical haulages, the author remarks generally that owing to the intermittent nature of the load, the high torque necessary for starting and the tendency for all haulages to be used together at the end of a shift, this kind of load is one of the most costly to supply unless a large number of haulages are worked from the same power house. Typical single and double reduction haulages are described in the Paper. The original controllers were of the oil-immersed drum type with metallic resistances, which were not only costly but occupied considerable space. Where water is available all the larger controllers are now of the liquid type, which is preferred on account of its simplicity and the finer speed adjustment obtainable.

The underground fixed lighting is confined to the immediate pit bottoms and the haulage and pump rooms. It is carried out at 110 volts by carbon filament lamps. Extensive use is made of electric miners' safety lamps, of which the Company have already between seven and eight thousand in use. It is found that the miners welcome their use in spite of the extra weight ($5\frac{1}{2}$ lb. against $3\frac{1}{2}$ lb. for flame lamps) on account of the greater illumination. Experience with these lamps shows that the energy required for charging is of minor importance, and the cost of attendance for charging and cleaning the electric lamps is comparable with the cost of the daily attention necessary in the case of ordinary oil lamps. The cost in the case of the lead battery of lamp renewals about equals the cost of battery maintenance. Two types of battery are used. With the original lead type the positive plates lasted about nine months; new positive plates were then inserted to run a further nine months, before the negative plates required renewal. Improved positive plates are now on trial, and it is hoped that they will last eighteen months. The alkaline type of battery is also under trial. Although these are twice as expensive as the lead type, their life is very much longer. In addition to the miners' lamp, a second type is being tried for officials and hauliers, with the battery strapped to the man's back and the lamp fixed in his cap.

The concluding part of the Paper dealt with haulage signalling by electric bells, a system which has been in use for about twenty-five years, although its safety has only been questioned during the last two years. Indeed, when the last Regulations were drawn up, little was known as to the degree of danger from ignition of gas due to open sparking from this cause. The author gives particulars of the experiments made by Home Office officials after the Senghenydd accident, at which he represented the colliery owners, and the subsequent experiments of Dr. Wheeler. Subsequent experiments at Faraday House are also referred to, showing the effect of inductance on the actual voltage developed at the break, which reached 180 volts in one case with only

nine cells in circuit. These records show the necessity of considering the inductance of the circuit before specifying the safety limit in terms of volts and amperes. The author suggests the following system for ensuring safety over moderate distances:—Bare galvanised wires of No. 8 S.W.G. should be run high up on insulators on opposite sides of the roadway. Bells to have the contact-maker completely enclosed in a metal flame-tight cover, the contact being shunted by a resistance or a condenser, the shunt being inside the bell case. The number of dry cells to be limited to 10, the batteries being sub-divided into two groups, one half being placed at either end of the line. The batteries to be kept in locked boxes of only sufficient size to hold the standard number of cells, so that they must be replaced when run down instead of an indefinite number being added. Signals to be made by switches actuated by a "pull" wire, the switches being enclosed in rigid metal, the covers being flame-tight, and the switch contacts breaking contact through non-inductive resistances contained in the same metal case as the switch. For long-distance signalling a high-resistance relay with a shunted contact and enclosed in a flame-tight, rigid, metal case should be used, the shunt resistance being inside the relay case. Where this is done the line pressure can be kept down to six volts. Alternatively the alternating-current system could be adopted. This has the advantage of getting rid of battery maintenance. The transformer pressure should be 15 volts, and the bells should have their coils enclosed in rigid metal.

The discussion in London was opened by Mr. C. H. Merz. Speaking of exhaust steam turbines, he said that he looked upon them only as a temporary expedient. Future developments would be in the direction of greater thermo-dynamic efficiencies. At present in comparatively small units, the gas engine was much more efficient, but in the larger units, the steam turbine scored.

Mr. S. Evershed, dealing with the question of sparking from bell circuits, pointed out that the factor that made for safety or danger was not the voltage but the electromagnetic energy stored in the circuit to be broken. The temperature of the spark was governed by the rate at which the induction decreased. If the spark were blown out by a magnetic blow-out the spark was made all the worse from their point of view. If there was sufficient energy and the electrodes were capable of being volatilised, a flash was obtained in addition to the spark, and the vapourised metal shot off. He believed that it was comparatively easy to devise a condenser system which would suppress the spark in a bell, but nevertheless the problem should be taken up of producing a bell in which there was absolutely no spark. The sparking made when the bell circuit was closed in the roadways was a greater difficulty than the bell itself. In a bell, platinum was used, and if care were taken that no other metal was near, there was nothing to vapourise, but in the colliery wires they used the worst material possible. There would be far less sparking with copper wires or copper-coated steel wires. He was not himself convinced that the Senghenydd disaster was due to the bell circuit, but felt that it was necessary to make the application of electricity in mines so safe that colliery owners need not fear to put in a little bell.

Mr. W. J. Larke, referring to Mr. Spark's strong plea for the earthed neutral, expressed the hope that he would go further and use his influence to ensure that the Home Office will make the earthed neutral compulsory. The argument on the part of colliery people was that with an unearthing system it is possible to continue working with a fault on the system, but this he regarded as the very reason why the earthed neutral should be insisted upon. With regard to the larger motors, he was of the opinion that the power factor corrector had not yet been properly considered in relation to the enormous financial advantage obtainable by its use. He also referred to the Ralph gas detector, which he said showed remarkable accuracy over a range of from $\frac{1}{2}$ to 3 per cent. of moisture.

Mr. W. R. Cooper asked for some further information as to the earth plate test, and

Mr. J. W. Holliday, who carried out the earth-plate tests for Mr. Sparks, said experiments had been made upon the resistance of various soils, and that of damp brown London clay was less than any other. It was approximately 40 ohms per foot cube. London tap water had a resistance of approximately 100 ohms per foot cube, and distilled water 1,500 ohms, all at 50° F. The addition of 0.008 per cent. of common salt by weight to the distilled water caused the resistance to fall to 175. This was equivalent to half an ounce of salt to a barrel of water. The principal factor in the resistance of the various soils was not so much the presence of water, but the traces of soluble salt, which lowered the resistance enormously.

Mr. A. Rushton spoke of the possibilities of economy in electric winding if several collieries combined for purposes of power supply, when the magnitude of the system would make the expense of load equalising apparatus unnecessary.

Mr. Sparks replied briefly.

COLLIERY ELECTRIC LAMP ROOMS

A PAPER by Mr. W. Maurice, read recently before the North Staffordshire Branch of the Association of Mining Electrical Engineers, dealt with the design and equipment of colliery electric lamp rooms. When the number of lamps did not exceed 200 to 300, existing lamp rooms could usually be adapted. Up to 200 lamps he recommended the wall type, and for more than that, the floor type of rack, and he favoured the Continental pattern in which the lamps are suspended on hooks instead of resting on shelves, as was usual for British flame lamps. The charging stands for the cells should be arranged so that when placed on the insulated shelves the cell terminals come automatically in contact with current-carrying strips immediately above them. Every charging board must be provided with voltmeter, ammeter, reverse current, cut-out, switches, fuses, and regulating resistances. He recommended that the charging voltage should not exceed 110 watts, which would charge 40 lead cells or 26 groups of two Wolf alkaline cells. The work benches required are generally similar to those used for flame lamps. Troughs with an adequate supply of water are necessary for the washing out of cells, &c., and a simple conveyor system which serves to transport the cells from one end of the room to the other is desirable. The cells can be placed in wheeled trays holding 20 each for this purpose. Lamp unlocking machines can be mounted at the ends of the benches, and small motor-driven cleaning machines with revolving brushes are required. The unlocking machines should be of massive construction, and are preferably worked by foot switches to keep both hands free. Electric lamp rooms should be more spacious than those used for flame lamps, and since no warmth is derived from the lamps, require to be heated. A supply of distilled water is essential. This may be obtained from small electrically-heated distillers. Every lamp room should have as an annexe a mechanical repair shop and a store room with lock-up cupboards for bulbs and other spares. Space is also sometimes required for a motor-generator and switchgear. Several typical electric lamp rooms were described in the Paper.

ELECTRIC STEEL

A T a lecture given recently before the Cleveland Institution of Engineers at Middlesbrough, Mr. V. Stobie gave a lecture on the manufacture of steel in the electric furnace. Steel made in the electric furnace, he said, had the following advantages over other steels:—(1) Regularity of composition; (2) lowering of sulphur and phosphorus; (3) absence of gases; (4) higher yield of sound ingots; (5) positive control of furnace operations. He had found that the electric steel furnace of his own design in combination with a basic open-hearth furnace would produce steels higher in quality than acid open-hearth steel at a lower cost. Molten steel of a very ordinary quality from a basic open-hearth furnace, treated in an electric furnace, would be equal in composition to acid steel made from the finest Swedish material; would be sounder; would give a greater yield from the ingot; whilst the cost price would not be increased by more than 9s. 6d. per ton. If the extra yield represented a 10 per cent. improvement on some existing practice, the saving might be taken as equivalent to 8s. per ton. This deducted from the extra cost gave a net extra cost of 1s. 6d. per ton. It was for the higher grades of steel that the electric steel furnace was brought into existence.

ELECTRICITY AT THE COAL FACE

A PAPER by Mr. J. Bowman with the above title was read at a recent joint meeting of the Scottish Branches of the National Association of Colliery Managers and the Association of Mining Electrical Engineers. Dealing with electric coal-cutters, the author said that the principal difficulties were due to the limited dimensions under which motors and controllers had to be constructed, especially those for use in thin seams. Trouble was generally caused in A.C. machines by the smallness of the air-gap, the burning out or breaking of resistances, the burning of contacts when the cutting wheel becomes jammed, and by the development of faults which were difficult to locate. Excessive heating of the windings when the material was difficult to cut was also liable to give trouble, and another cause was the lack of knowledge by those who are responsible for keeping the machines in good order. A simple fault might occur that involved stripping part of the winding. This must be done on the surface, and in the event of no spares being at hand that section of the mine

may be idle. Another source of trouble was the trailing cable. There was difficulty in providing an efficient earth connection from the machine to the main cable and keeping it in that condition. More than once the author had seen the earth core broken without the fault being visible, and although this could be got over by using an equivalent sectional area of copper as an outer spiral armouring to the cable, in addition to the earth core in the interior, the method added considerably to first cost. In electrical heading and boring machines the motors were often not constructed of sufficient size to be efficient. The use of such a machine was to a certain extent limited, but a light portable electric machine capable of boring shot-holes in coal would be a valuable asset in many collieries.

Electricity might be applied to all types of conveyors at present on the market, but with especial ease to all those conveyors which continuously move in one direction. The advantages of electric self-contained haulage gears were also touched upon, and with regard to dock-face pumping the ideal equipment would be a compact, direct-driven turbopump on a bogie; the solid matter found in the water sometimes precluded its use. In many cases where there were difficulties in ventilating the face a small electrically-driven fan would give excellent results. There were sometimes cases where compressed-air apparatus might be preferred, and this could be worked most advantageously by local electrically-driven air compressors.

MINING AND METALLURGICAL PATENTS OF FEBRUARY

Mining.

IMPROVEMENTS of detail in the construction of electric miners' lamps are described in Specification No. 2,063 of 1914 by J. F. Turquand. These relate chiefly to the construction of a gas-tight switch, and the arrangement of packing to render the joint of the outer glass gas-tight. An interesting patent, in view of the investigations recently made on the danger of ignition from colliery bells, is No. 2,808 of 1914, in which Dr. W. M. Thornton protects the application of a non-inductive resistance in parallel with the magnet coils of a bell to diminish sparking at the trembler contact to such an extent that ignition of gas cannot take place. Another specification relating to electrical engineering in mines is No. 6,351 of 1914 of the B.T.-H. Co. and E. I. David for mechanical arrangements in the control of electric winding gears. The depth indicator and operating lever are interlocked by means of a drum carrying guides, so that the movement of the liner is limited at starting, and it is automatically brought back to the "off" position at the end of the wind.

Metallurgical.

A specification (No. 15,456 of 1914) by F. J. Machalske describes furnace electrodes of the block type, consisting of a carbon rod or rods enveloped by a refractory magnesium basic slag, producing material of relatively low resistance when heated. Another patent relating to electric furnaces is one by J. L. Dixon (No. 4,742 of 1914), which covers a number of arrangements of connection of arc furnaces in which the current flowing through an electrode in the body of the furnace is adjustable relatively to the current in the main carbon electrodes. One such arrangement is the connection of the lower electrode to the star point of a three-phase system, with the carbons connected to the three phases. Eight different arrangements, some for two-phase and some for three-phase supply, are described.

An Unusual Accident.—An electric blasting accident of a peculiar nature which occurred recently on one of the Rand mines is reported in the *Iron and Coal Trades' Review*. A round of holes which had just been connected up for firing exploded suddenly, causing four deaths and several injuries. The explosion is attributed to lightning striking the ropes of the skip or the guide ropes, and that these acted as a conductor, connecting with the cable or the wires at the bottom of the shaft.

West of Scotland Branch of the Association of Mining Electrical Engineers.—At a recent meeting of this Branch at Glasgow, Mr. A. Smellie read a Paper on "Experiences in the Handling of Electricity," in which he described the electrical equipment of the New Cummock Collieries in Ayrshire. He urged the necessity of machinery of the best quality obtainable to ensure reliability and reduce maintenance costs to a minimum, and showed how the change from steam to electric driving in a colliery could be made gradually, and the men trained to the new conditions and the conversion proceeded.

ELECTRICAL MINING PLANT

MINING electrical engineers will welcome one of the most recent and, we may say, one of the best-prepared pieces of technical literature that has been produced by the General Electric Co., Ltd. (67 Queen Victoria Street,

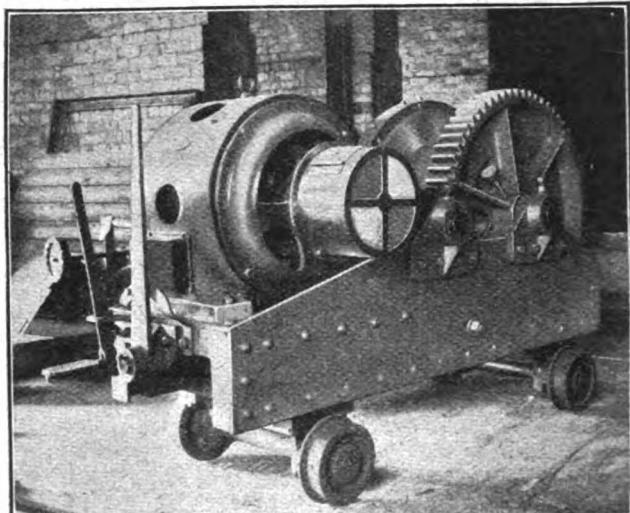

FIG. 1.—50-H.P. PORTABLE HAULAGE GEAR.

E.C.), in the shape of Part I. of the G.E.C. Bulletin on colliery and mining machinery. This is a work of over 180 pages full of engineering information regarding electrical mining plant, incidentally illustrating a large number of

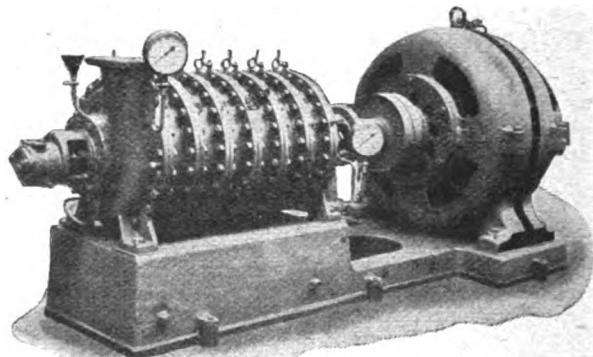

FIG. 2.—80-H.P. WITTON MOTOR DRIVING SIX-STAGE CENTRIFUGAL PUMP.

examples of machinery and apparatus supplied by the Company, and putting forth data of considerable utility to those engaged in the selection of colliery equipment. The title of the first section, "General Considerations concerning the

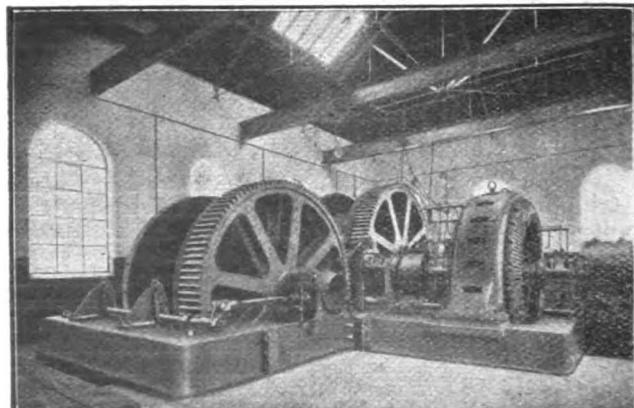

FIG. 3.—400-H.P. HAULAGE GEAR AT BRANCEPETH COLLIERY.

"Selection, Installation, Connecting-up, and Arrangement of Generating and Transforming Plant for Collieries," aptly describes its range, but particular attention should be called to the useful series of diagrams of transformer connections.

The general lay-out of power houses and sub-stations is then considered, and views and plans of typical generating stations equipped with "Witton" plant are reproduced. The following section treats of motor-driven fans, air compressors, and other appliances. The whole subject of motors for mining work is dealt with, and the special explosion-proof motors made by the Company are illustrated and the many good points in their design explained. Particular attention has been paid not only to the flame-proof nature of the motor, but to the way in which the cables are taken to the motors

of the products in this direction have been illustrated in ELECTRICAL ENGINEERING. The most important points of their designs on this class of work are detailed in a section on colliery switchgear and relays, which is very comprehensive. In this are included special instruments, such as a new gas detector, and protective apparatus of a variety of types, including the Moscicki condenser and Giles valve systems. Much practical information on colliery cables occupies another section, with a few details as to transmission lines. Other subjects treated are mining telephones

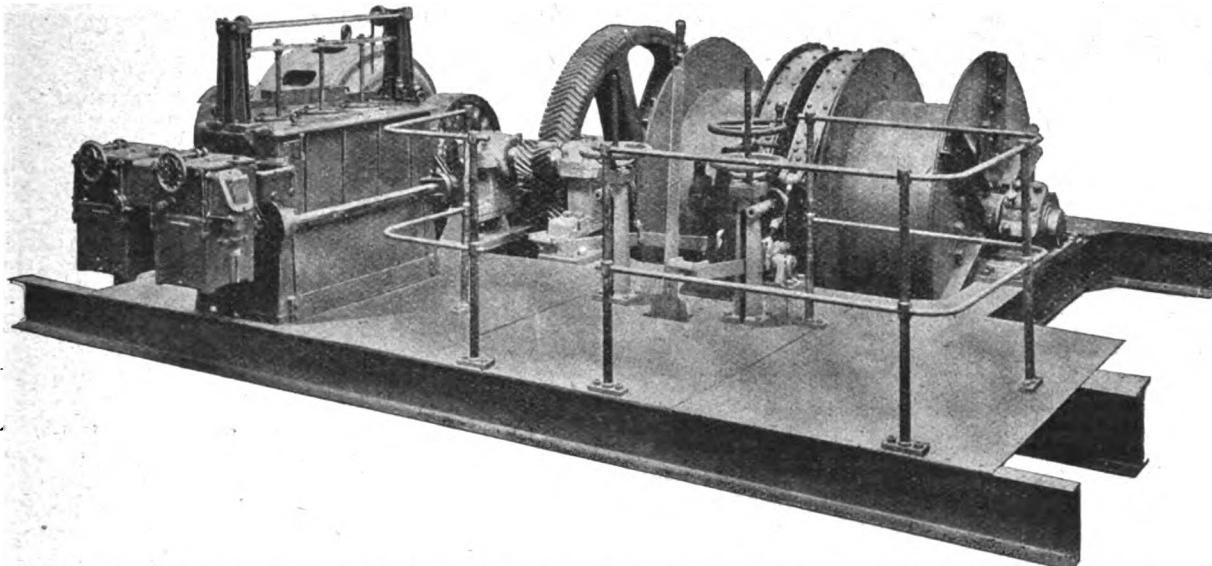

FIG. 4.—140-H.P. MAIN AND TAIL HAULAGE GEAR WITH OIL-IMMERSED CONTROLLER AT WALESWOOD COLLIERY.

and the bringing out of the stator connections. A convenient portable haulage gear driven by a Witton induction motor is shown in Fig. 1, and another Witton motor is seen driving a centrifugal pump in Fig. 2. The section devoted to winding plants is particularly interesting, and contains a description of the Ilgner system of flywheel storage and other methods of control. An example of a main-and-tail haulage gear, showing the control apparatus, is shown in Fig. 4. The Company have for long paid special attention to mining switchgear, and from time to time a number of examples

and colliery lighting. The whole work reflects great credit on its compilers, and is an evidence of the thoroughness with which the General Electric Co. have gone into the many special problems arising out of the applications of electricity to mining work. It will be remembered that Part II. of the G.E.C. Colliery Bulletin, which partakes more of the nature of a catalogue of the Company's electrical mining plant and appliances and dealt in greater detail with mine signalling apparatus, has already made its appearance, and was reviewed in ELECTRICAL ENGINEERING, Jan. 7th, p. 5.

ELECTRICAL MEN ON MILITARY SERVICE

THE third list of members of the Institution of Electrical Engineers on military service has just been issued, and includes 72 names, bringing the total to 805. The first list was published in our issue of Jan. 21st, and the second list on Feb. 18th. We give the third list in full below:—

MEMBERS.

W. Bridges (Major, R.F.A.), W. F. Long (Capt., Cape Fortress Engineers, R.E.), J. C. M. Matthews (Corpl., Malay States Volunteer Rifles), H. L. Percy (Lieut., Ceylon Engineer Volunteers), F. Pickering (Major, Cape Fortress Engineers, R.E.), R. E. P. Pigott, C.I.E. (Major, 12th Essex Regt.), C. T. Williams (Capt., Northern Signal Service, R.E.)

ASSOCIATE MEMBERS.

W. Baker (Sergt., Cape Garrison Artillery), L. C. F. Bellamy, C. Bollam (Lieut.), J. M. M. Booth (2nd Corpl.), J. M. Brewis (Lieut.), I. C. Brown (Southern Provinces Mounted Rifles), E. A. Corbin (Malay States Volunteer Rifles), V. K. Cornish (Chief Electrician, Lines of Communication, Suez), J. Cunningham (Staff Sergt., Bombay Volunteer Artillery), I. S. Dagleish, C. H. W. Edmonds (Lieut.), S. G. L. Eustace (Calcutta Light Horse), T. I. M. Gordon (Penang Volunteers), N. Harrison (Major, Union of South Africa Defence Force), H. W. Henderson (Calcutta Port Defence Volunteers), A. I. Hodgson (2nd Lieut., Hyderabad Volunteer Rifles), W. J. Horne (Capt., Union of South Africa Defence Force), J. W. Houghton (Canadian Engineers), J. A. W. Kerr (Capt., Transvaal Scottish), D. Kerridge (Bengal Nagpur Volunteer Rifles), D. S. Laurie (2nd Lieut.), W. R. Macdonald (Lieut., Canadian Naval Service), W. D. MacGregor (Capt., Bangalore Rifle Volunteers), H. C. Osborne (Bombay Volunteer Artillery), A. M. Peddie (Imperial Light Horse), J. A. Rutherford (2nd Lieut.), R. Sawers, Junr. (2nd Lieut.), J. H. Shannon (Sub-Lieut.), W. S. Sholl (Algoa Rifle Corps), A. F. H. S. Simpson (Capt., Caucasian Cavalry Division, Russian Army), H. R. Speyer (Lieut., Cossi-

pore Artillery), G. Sykes (Warrant Officer, Admiralty Inspector of Aeroplanes and Seaplanes), H. C. Symmes (Capt., Witwatersrand Rifles), W. I. Tarleton (Sergt.-Major, Cape Fortress Engineers, R.E.), Capt. A. C. Trench (R.E.), Capt. C. E. Vines (R.A.), T. H. Vitty (Capt.), W. G. Ward (Capt.), D. B. Webbe (B. B. & C. I. Rly. Volunteers), S. Webster (Rangoon Port Defence Volunteers), J. W. Wyles (Corpl., Bombay Harbour Defence, R.E.).

ASSOCIATES.

A. L. Annison (2nd Corpl.), W. Bell (Lieut., Mussoorie Volunteer Rifles), H. H. J. W. Drummond (Col., 2nd South-Western Reserve Mounted Brigade), A. R. Walmsley (2nd Lieut.).

GRADUATES.

J. R. Danson (Sergt.), E. F. Hollands (Motor Cyclist, Union of South Africa Defence Force), W. R. Lewis (2nd Lieut., South African Ambulance), J. A. Lloyd (Sub-Lieut.), J. Morgan, H. Morris (Cullinan's Horse), N. B. B. Patel (Poona Volunteer Rifle Corps), C. W. Pearce, G. H. N. Reay (Lieut.).

STUDENTS.

S. J. W. Baldwin (Petty Officer, Royal Naval Air Service), C. H. Brazel (2nd Lieut.), A. S. Bruce, T. S. Brunton (Bombay Volunteer Artillery), D. Mathieson (Singapore R.E. Volunteers), H. P. Organ (2nd Lieut.), J. J. Page (2nd Lieut.), E. J. Symons, H. R. Tuppen (Lieut.), B. P. K. Walsh (Cape Fortress Engineers, R.E.), C. Young (Air Mechanic, Royal Flying Corps).

The Finsbury Magazine.—The magazine of the Old Students Association of Finsbury Technical College contains an excellent portrait of Mr. J. E. Raworth, President of the Association. In addition to a quantity of information as to the doings of past and present students, the last issue contains a contribution by Mr. J. K. Catterson-Smith on Phase-advancers, a description of the Humphry gas pump, and a most interesting account of the mobilisation of the London Electrical Engineers just before war was declared.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published Feb. 25th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

2,327/14. Train Lighting. H. LEITNER. Improvements in variable-speed dynamos for train and car lighting, consisting in the provision of a series field winding adapted to superimpose upon the normal regulation for speed purposes an additional regulation compensating for load and limiting the output with rise of voltage. (Four figures.)

2,605/14. Water Heating. A. F. BERRY. An electric water heater of the type in which the water is heated as it issues from a tap. The switch controlling the heating elements is arranged so that it pushes the tap open when the current is put on, and progressively cuts in more powerful elements as it opens the tap wider. The tap can, however, at all times be opened to a greater extent than that corresponding to the position of the switch, and when fully open the switch can be turned in the opposite direction to cut in a specially powerful element. (Three figures.)

3,696/14. Fuses. E. O. SCHWEITZER, N. J. CONRAD and SCHWEIZER & CONRAD INC. (*Chicago*). A high-tension fuse with a short fusible wire enclosed in a tube full of liquid arranged with a spring pulling the terminals apart when the wire fuses to increase the length of break, and at the same time, by the movement of a funnel-shaped plunger, to direct the liquid against the arc. (Seven figures.) This fuse was described in ELECTRICAL ENGINEERING, Vol. X., p. 565, Oct. 29th, 1914.

4,813/14. Electric Train Lighting. B.T.-H. Co. (*G.E. Co., U.S.A.*). A system of lighting electric trains in which variation of the lights due to variation of voltage and extinction due to temporary interruption of the supply is prevented by the use of a machine coupled to a flywheel which normally runs as a motor, storing energy, but on a drop of voltage acts as a generator to supply the lights. (One figure.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: DOULTON and MORRIS [Cable troughs] 2,871/14.

Dynamos, Motors, and Transformers: CUMONT [Motor control] 515/14; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Control system for motors supplied with pulsating current] 2,959/14; B.T.-H. Co. and WHITAKER [Current collectors for dynamos] 3,596/14.

Electrometallurgy and Electrochemistry: LEVIN [Electrolytic apparatus] 3,654/14; Soc. GÉNÉRALE DES NITRURES [Fixation of nitrogen] 22,586/14.

Heating and Cooking: HIRST and ARCHER [Electric heating apparatus] 4,432/14; FOSTER, ARUNDALE and DAVIS [Stove] 9,794/14.

Ignition: TEAGUE [Magneton] 25,855/13 and 21,590/14.

Switchgear, Fuses, and Fittings: B.T.-H. Co., YOUNG and GARTON [Motor starters] 3,385/14; SCRUBB [Thermal switches] 18,418/14.

Telephony and Telegraphy: AUTOMATIC TELEPHONE MANUFACTURING Co. and RAY [Telephone system] 2,270/14; AUTOMATIC TELEPHONE MANUFACTURING Co. and SAVIN [Telephone systems] 3,195/14; MARKS (*Electrical Experiment Co.*) [Telephone receivers] 9,638/14.

Traction: DEAN [Switches for automobiles] 3,706/14; ROYDHOUSE and CHEESEMAN [Power transmission, starting and lighting system] 3,925/14; CLARKE [Audible signal repeaters] 9,504/14.

Miscellaneous: TURNER [Control of lighting by selenium cells] 7,440/14; ROBERTSON and BOWMAN [Mine signalling] 9,201/14; HARLÉ ET CIE. [Distant control] 17,567/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Distributing Systems, &c.: PETERS [Limiting reactance coils] 23,359/14.

Dynamos, Motors, &c.: NOLAN [Cooling motors] 24,496/14.

Heating: MAJESTIC ELECTRIC DEVELOPMENT Co. [Radiator] 1,740/15.

Telegraphy: SIGNAL GES. [Sending device for subaqueous telegraphy] 1,857/15.

Miscellaneous: "VULKAN" MASCHINENFABRIKS A.G. [Electrically controlled feed mechanism] 1,284/15; FARNSWORTH & ANR., 1,869/15; STILLE [Electro-optical cells] 1,973/15.

Applications for Suspension of Patents

10,859/01 and 24,439/02. **Alumino-thermic Welding.** H. GOLDSCHMID (Essen, Germany). The Board of Trade has decided, upon the application of W. L. Turner and H. A. Blackwell, that these patents, which cover the well-known process of "Thermit" welding more particularly as applied to tramway railjoint welding, be "avoided."

Amendments Made

3,919/14. **Engine-starting and Car-lighting Apparatus.** WILLOCQ, REGNAULT & Co. This specification, which is for an arrangement of a combined starting motor and lighting dynamo on a transverse shaft in front of the bonnet, is to be amended by the insertion of a statutory reference to Patent No. 12,960/14 of H. J. O'Neill (New York).

Opposition to Grant of Patents

28,527/13. **Motor Control.** R. AMBERTON (Electrical Apparatus Co.). Opposition has been entered to a grant on this specification, which is for a rheostat interlocked with a circuit breaker so as to give a no-voltage release.

7,677/14. **Resistances.** J. COLLINSON. Opposition has been entered to a grant on this specification, which is for a method of construction of grid-type resistances.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

4,215/01. **Telephone Switches.** H. H. LAKE (*Telephonfabrik A.G. vorm J. Berliner*). Switchboard system for inter-communication telephones, in which the switches are mechanically interlocked, so that putting one on restores all others that may have been "on" to the "off" position.

4,330/01. **Radiator Lamp Contacts.** H. J. DOWSING. A system of lamp holders and caps for radiator lamps in which split contact pins in the holder engage in holes in the contact blocks of the lamp cap.

The following are the more important Patents that have become void through non-payment of renewal fees.

Dynamos, Motors and Transformers: A. G., BROWN, BOVERI & CIE. [*A.G. Commutator machines*] 20,899/09.

Electrochemistry and Electrometallurgy: J. HÄRDEN [Electric furnaces] 26,251/09.

Switchgear, Fuses and Fittings: F. D. HALLOCK [Motor starter] 23,602/08.

Telephony and Telegraphy: A. T. M. JOHNSON and G. GUYOTT [Telegraphy] 22,924/01; AMERICAN AUTOMATIC TELEPHONE Co. and C. L. GOODMAN [Telephone selector switches] 25,896/09.

Traktion: B.T.-H. Co. (*F. E. Case*) [Multiple unit traction control] 22,543/01; B.T.-H. Co. (*A. S. Garfield and C. E. d'Ornellas*) [Train control] 22,546/01; J. SHAW [Collecting shoes] 24,630/03; W. R. SYKES [Signalling] 24,030/08; H. P. SAUNDERSON [Transmission gear for electric automobiles] 26,372/09.

Miscellaneous: WAYGOOD & OTIS [Electric lift control] 24,455/02; KELVIN & WHITE, F. W. CLARKE and L. W. P. CHETWYND [Ship's compasses] 25,718/09; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Electric propulsion of ships] 26,346/09.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS. A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,432.

How can one calculate the "whirling" or critical speed of a 5-ft. mild steel transmission shaft $1\frac{1}{2}$ in. diameter without any revolving masses on it (a) when running in plain bearing at each end, and (b) when running in freely swivelling bearings?—"UNIT POLE."

(Replies must be received not later than first post, Thursday, March 11th.)

ANSWERS TO No. 1,430.

Three rotary converters are run from a six-phase alternator, and are started up through low-voltage tappings. Resistances are inserted in these tappings, and have been burnt out in one rotary. Can this rotary be started up across high-voltage tappings, and if possible, what precautions are necessary in running up? The rotaries have A.C. voltmeters and ammeters on each panel. The alternator is excited by a shunt-wound exciter on the end of the shaft, and the voltage in the alternator is regulated by resistance in the exciter field, and may be further reduced by resistance inserted between the exciter and the rotor of the alternator. The other two rotaries can be shut down whilst running up.—"ROTARY."

The first award (10s.) is given to "ALPHA" for the following reply:

Only a small low-voltage rotary converter could be started up by throwing direct on to full line voltage; an ordinary machine would spark and damage the commutator surface, even if it did not actually arc over. In addition to this, a very heavy starting current would be drawn from the alternator, probably about four times normal full-load current. Resistances are not usually installed in the low-voltage tappings of tap-started rotaries, and it is probable that those mentioned by "Rotary" as having burnt out were inserted only to reduce the starting current, and that the rotary would start safely on the low-voltage tappings with the resistances cut out. No particulars are given in the inquiry from which one could judge whether this is the case, but if the rotaries start with the resistances without bad sparking or spitting, and the voltage drop across the resistance is not more than 10 or 15 per cent. of the (diametrical) slip-ring voltage, it would be safe to start without the resistances, at any rate temporarily, while they are being repaired. This, of course, would not interfere with the operation of the other machines.

An alternative, which would necessitate shutting down one of the other rotaries while starting up the faulty one, would be to run temporary connections from the starting switch of the faulty machine to the starting resistances of one of the other rotaries. The faulty machine could then be started by using the low-voltage tappings and resistance of the other machine and switched over on to its own full voltage (running) taps, leaving the starting tappings free for the other machine. If, as is almost certain to be the case, each rotary is normally supplied from separate windings, either on the alternator or a transformer secondary, it would

be necessary to use another triple-pole switch in addition to the usual starting switch, and to throw over both switches together, since all six phases of the rotary would have to be thrown over from the winding which was being used for starting to the normal running connections. It would be necessary to carefully check the phases of the temporary connections to ensure that the slip-ring which is connected to (say) phase A of the alternator in the running position is connected to the corresponding phase of the starting winding, and similarly with the other rings, otherwise there would be a danger of the rotary not being correctly in phase, and flashing over when the switch was thrown from the starting to the running position.

If neither of the above methods can be used, there is a third scheme, which would, however, necessitate shutting down both the other machines while starting up the faulty one. First note the voltage between two blades of the triple-pole starting switch at the moment of starting up one of the rotaries in the ordinary manner. The figure required is that to which the voltage drops when starting; it is not sufficient to measure the voltage before the switch is closed or after the machine has run up, as this would not allow for the drop in the resistances. To get this reading it may be necessary to temporarily reconnect one of the A.C. voltmeters. Next shut down this rotary and connect the voltmeter between the corresponding full voltage (running) contacts of the switch of the faulty machine. Reduce the alternator voltage until this reading is the same as that shown when starting the other rotary. The switch may then be closed and the rotary will start up and pull into synchronism in the usual way, when the alternator voltage can be brought back to normal. If it is necessary to slip a pole to reverse the D.C. voltage, this must be done while the set is running on reduced volts. If the rheostat capacity available will not reduce the alternator voltage sufficiently at full speed, the alternator speed must be reduced to give the correct voltage during starting, and must not be brought up until the rotary is running in synchronism and with correct polarity.

The second award (5s.) is given to "Electron," who writes as follows:—

It is impossible to give a direct answer to the problems which "Rotary" raises, because he does not afford sufficient particulars to enable this to be done. He speaks of low-voltage tappings, but does not explain whether these are taken from a transformer or not, as they may be, as it is a very unusual thing to have low-voltage tappings on a generator; but if there is a transformer, it is not clear why the generator should be wound six-phase; a three-phase generator would meet the case. Nor does he explain the function of the resistances.

In examining the situation, the first point to be considered is how the three rotary converters are run from the six-phase alternator. As the writer has explained in answer to Question No. 1,408, ELECTRICAL ENGINEERING, September 24th, 1914, there are only two ways of running rotaries direct from the generator without the intervention of a transformer: one is to have a separate winding for each rotary, while the second is to use the patented method with balancing coils described in the answer mentioned. In neither of these cases are resistances used, and why a resistance should be required to start up a rotary converter when low-voltage tappings—whether they be from the generator or transformer does not matter—are available, it is difficult to understand. Resistances are used for starting up and synchronising rotary converters by a patented method, the rotary converter being switched on to full voltage with the resistance interposed between itself and the transformer or generator. The resistance is then cut out and the rotary runs up to speed and falls into synchronism. But no low-voltage tappings are required by this method.

Fortunately, however, while it is not possible to diagnose the case, it is not difficult to prescribe a remedy. "Rotary's" problem, as he sets it out, is to start up one of the rotaries on which the starting device has suffered some damage. What that damage is the question does not make clear. But he tells us that the two other rotaries can be shut down whilst the one mentioned is being run up. A perfect remedy for his trouble is therefore available. All he has to do is to switch the rotary with the disabled starting gear direct on to the generator before the latter is started up, or alternatively while the generator is running on zero voltage. In the former case the rotary will come up with the generator, and in the latter it will be brought up to speed by raising the voltage. The precautions which have to be taken in starting up a rotary by this method are those

which obtain with a rotary converter started from low-voltage tappings or with a self-synchronising motor. If the rotary has a field-splitting switch, as it probably will have, in starting up from the A.C. side this should be opened during starting. After this rotary has been run up to speed, the other two machines can be then started by the existing method, whatever that may be.

A further alternative would be to run the converter up to speed from the high-voltage tappings at full pressure, inserting a temporary starting resistance in three of the phase leads. The three-phase main switch is first closed, the resistance gradually cut out until the rotary falls into synchronism, and the liquid starter short-circuited.

QUESTION No. 1,429.

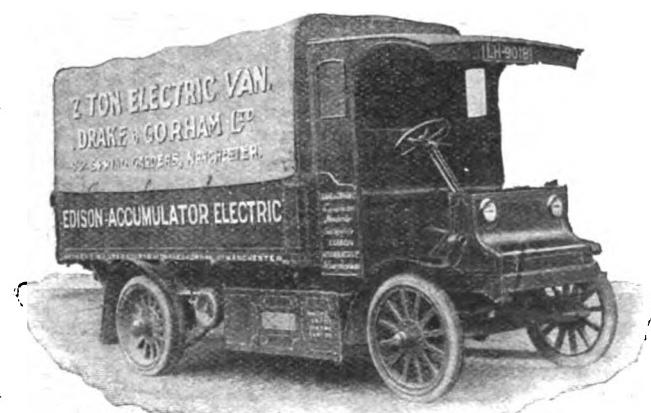

Prof. D. Robertson (Bristol) has written calling attention to the answers to above question given in our last issue. He says that although both are correct in referring the trouble to the

rotor voltage, they are incomplete for the following reasons : (1) A connection between one point of the rotor winding and the frame could not by itself produce any appreciable P.D. between the frame and earth. (2) The rotor voltage dies away gradually as the machine gets up speed, and does not disappear immediately the starter is put on the first step. To produce a live frame by connecting it to the rotor winding there must, in addition, be a connection to earth at some point of the rotor circuit outside the machine—say on the starting rheostat—and for the symptoms to disappear as soon as the rotor circuit is completed, the two points must be so placed that under the normal rotor currents they take the same potential. The true solution to the riddle is that the neutral point of the rotor winding is connected to the frame, probably intentionally in order to limit the voltage of the slip-rings to the frame to that of one rotor phase. The free end (that is, the end which the starting switch touches on the first step, and which then becomes the neutral point of the starting rheostat) of one leg of the resistance has also gone to earth.

"ELECTRICAL ENGINEERING" TRADE SECTION

AN ELECTRIC DEMONSTRATION VAN

IN view of the increasing interest that is being evinced in the great possibilities of electric battery vehicles, Messrs. Drake & Gorham, Ltd. (47 Spring Gardens, Manchester), are conducting an energetic campaign towards popularising the use of electric vans in Lancashire and Cheshire, and to this end have acquired a demonstration van having a loaded capacity of two tons. This van, which is illustrated here, has a body of special design, and can

EDISON BATTERY DEMONSTRATION VAN.

be arranged to be used as a covered van and open waggon or a flat lorry. The motive power is derived from a battery of Edison accumulators carried in a cradle below the van body. The side doors of the cradle—which is fitted with steel compartments—are under-hinged, and, when open, the accumulators can be withdrawn laterally for inspection. The compartments are dust-proof and water-proof, though well ventilated. The motor is of the totally enclosed traction type, and drives through a differential gear to a lay shaft and thence by roller chains to the rear wheels.

The Ediswan Works.—The Edison & Swan United Electric Light Co.'s Ponders End Works, Middlesex, were visited on Wednesday of last week by the members of the Chemical Society, Royal College of Science, South Kensington, Mr. E. W. Swann, their Excursion Secretary, being responsible for the arrangements. An interesting visit was made to all the lamp manufacturing departments, including carbon and drawn wire sections.

Roll of Honour.—The British Aluminium Co., Ltd., have issued a Roll of Honour of artistic design containing the names of over 350 men from their various factories, office staffs, &c., who are serving in the forces of the Allies. In addition to these some 85 men left at the beginning of the war to join their regiments, but their exact position cannot be traced.

CATALOGUES, PAMPHLETS, &c., RECEIVED

BATTERY LAMPS.—A catalogue from the Essex Accumulator Co. (697/9 Grove Green Road, Leytonstone, N.E.), gives particulars of a large number of patterns of self-contained battery lamps, both with accumulators and with dry cells, including the ordinary types of torch and pocket lamp, as well as many well-made portable lamps for special purposes, among which we notice in particular several in leather cases with straps for military work with batteries of considerable capacity and spare lamp bulbs all ready in holders within the case.

SWITCHBOARDS.—A leaflet from J. H. Holmes & Co. (Newcastle-on-Tyne) illustrates a variety of typical switchboards built by them, including both high- and low-tension gear, and the special ironclad draw-out gear for substation work, &c., which they have recently developed.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

TIDE TABLES.—We have received from Alfred Graham & Co. (St. Andrew's Works, Crofton Park, S.E.), who specialise in telephone equipment for marine purposes, a copy of the useful little pocket-book which they issue annually containing speed and tide tables for the principal seaports in the United Kingdom, and a quantity of special port information, &c. A glossary of electrical terms and other selected engineering data are also included. The company have also been kind enough to send us one of their conveniently arranged blotters with diary attached.

AIR FILTERS.—Catalogues from the Premier Cooler & Engineering Co., Ltd. (Broadway Court, Westminster), contain particulars of their wet- and dry-air filtering equipments for dealing with the ventilating air for large turbo-generators and similar purposes.

TRACTION BATTERIES

WE have received a long letter from Mr. R. J. Mitchell (Commercial Engineer, Edison Accumulators, Ltd.) commenting on some statements which have appeared in our contemporary, the *Commercial Motor*, in an article on "The Choice of a Battery." Mr. Mitchell refutes the statement that the lead battery is more popular than any other in this country for electric vehicles by remarking that about 90 per cent. of all commercial electric cars in Great Britain are equipped with the Edison accumulator. One firm alone will shortly have nearly 50 Edison battery vehicles. There should be no difficulty in deciding what type of battery to employ if it is required to run a vehicle at the least possible expense. His Company, he intimates, are prepared to back this opinion with actual guarantees. There is only one lead battery, he says, sold for traction purposes in this country with a guarantee, and this is on the basis of 80 per cent. of the rated capacity after two years' service. The majority of lead batteries, he says, have to be exceedingly well looked after

to give 8,000 to 10,000 miles' service under commercial conditions. Now the Edison battery (which, according to the *Commercial Motor*, "must of necessity be replaced at the end of four years, whether used or not") is founded on a chemical principle preserving it from all but the slightest traces of deterioration on open circuit, and is guaranteed to give its full capacity after four years' service with no plate renewals. Cases are mentioned of batteries which, after running 50,000 miles in five years, have been found to have a capacity of 10 per cent. above their original rating. It is quite true, continues Mr. Mitchell, that most lead accumulators maintain their voltage better on very high rate discharges, but against that must be set the fact that it is very detrimental to the cell to take heavy currents therefrom, whereas he claims that the Edison cell may be completely short-circuited and left out of commission if necessary for an indefinite period without harm. He points out the further advantages of the Edison cell in that it can stand charging at a rate that would mean destruction to a lead cell, and its immunity from damage due to long-continued vibration. Moreover, the Edison cell uses a steel preserving electrolyte in place of acid, which in itself eliminates a number of minor disadvantages. Again, while the general upkeep of the Edison cell involves merely charging as and when required, and the simple precaution of not allowing the exterior of the cells to become dirty and wet, the procedure in the case of the lead battery is relatively complex, and involves a number of "douts" which may be ignored with a steel battery. It is also much easier to judge of the state of charge of an Edison cell by means of an ampere-hour meter, because the ampere-hour capacity is nearly constant for all rates of discharge. Finally, an Edison cell is quite unharmed by being discharged to complete exhaustion and left in that state for long periods.

Mr. Mitchell encloses the following table of comparative weights of Edison cells and two well-known makes of lead cell :—

| Make of Battery. | Rated Output in kw.-hours. | Gross weight in lbs. | Weight in lbs. per rated kw.-hours. |
|------------------------|-------------------------------|-------------------------|---|
| Ironclad | 10·6 | 1,350 | 127 |
| El.S.B. Co. Thin Plate | 12·8 | 1,350 | 105 |
| Edison A-4 | 10·8 | 900 | 84 |
| Ironclad | 13·2 | 1,620 | 123 |
| El.S.B. Co. Thin Plate | 17·1 | 1,720 | 100 |
| Edison A-5 | 13·5 | 1,100 | 82 |
| Ironclad | 18·5 | 2,200 | 119 |
| El.S.B. Co. Thin Plate | 21·4 | 2,100 | 98 |
| Edison A-6 | 16·2 | 1,260 | 78 |
| Ironclad | 23·8 | 2,750 | 115 |
| El.S.B. Co. Thin Plate | 27·8 | 2,650 | 96 |
| Edison A-8 | 21·6 | 1,820 | 84 |
| Ironclad | 26·4 | 3,080 | 117 |
| El.S.B. Co. Thin Plate | 32·1 | 3,080 | 96 |
| Edison A-10 | 27·0 | 2,250 | 84 |
| Edison A-12 | 32·4 | 2,700 | 84 |

Arrangements for the Week.—(To-day) Thursday, March 4th.—Greenock Electrical Society, 21 West Stuart Street. "The Operation of a Large Electric Supply System," by G. Macdonald. 7.30 p.m.

Tuesday, March 9th.—Institution of Electrical Engineers, Manchester Section, at Engineers' Club. "Electricity Applied to Mining," by C. P. Sparks. 7.30 p.m.

Institution of Electrical Engineers, Scottish Section, at Princes Street Station Hotel, Edinburgh. "Automatic Protective Switchgear for Alternating Current Systems," by E. B. Wedmore. 8.10 p.m.

Wireless Society of London, at I.E.E., Victoria Embankment. "Waves," by Dr. J. Erskine-Murray. 8 p.m.

Wednesday, March 10th.—Institution of Electrical Engineers, at Philosophical Hall, Leeds. "Electric Cooking Mainly from a Consumer's Point of View," by W. R. Cooper. 7 p.m.

Royal Society of Arts. "Patent Law Reform and the War," by J. W. Gordon, K.C.

Thursday, March 11th.—Institution of Electrical Engineers. "Electric Cooking Mainly from a Consumer's Point of View," by W. R. Cooper.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Blackburn.—The Borough Electrical Engineer is working out details of a new power house. The estimated cost is £100,000.

Dover.—The Borough Electrical Engineer has recommended the installation of a 1,000-kw. turbo-alternator set with accessories at an estimated cost of some £6,000. He estimates a saving in running costs of £400 per annum with coal at 16s. 6d. per ton, the average normal price, or £485 with coal at £1 per ton.

Hull.—Extensions to the generating plant at an estimated cost of £41,500 have been approved. A 5,000-kw. turbo-alternator is recommended, with two water-tube boilers, coal-handling gear, cooling pond, &c.

Knaresborough.—The Council has agreed with the Harrogate Corporation as to the area within which the latter shall give a supply.

Leeds.—The Council has sanctioned the application for a loan of £200,000 for mains extensions, transformer substations, a new turbo-alternator and condensing plant, &c.

London: Stepney.—The Finance Committee of the L.C.C. recommends sanction to a loan of £15,000 for mains, feeders, and general extensions.

Londonderry.—Twelve months' supply of cable, meters, carbons, house fuse-boxes, &c. Borough Electrical Engineer. March 13th.

Manchester.—Three three-wire balancers. City Electrical Engineer. March 10th.

Newcastle-on-Tyne.—In order to provide additional machinery, the directors of the Newcastle & District Electric Lighting Co. will shortly be asking its shareholders to sanction an increase in borrowing powers.

Norway.—The Christiania Municipality requires 148,000 metres of high- and low-tension cable. Kristiania Elektricitetsverkets Expeditionskontor, Christiania. March 25th.

Plymouth.—An expenditure of £280 upon repairing cable on two sections of the network has been sanctioned.

Wiring

Burnley.—Electric light work. Clerk to Guardians. March 22nd.

Leeds.—Electric lighting at the workhouse.

Manchester.—Lighting of new ward pavilions and isolation block at Monsall Hospital. Town Clerk.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Bradford.—Business premises. Architect, James Young, 62 Market Street.

London: Deptford.—Baths, washhouses, and branch library. Evelyn Street. Town Clerk.

Swindon.—Factory for Imperial Tobacco Co.

Miscellaneous

Belfast.—Three, six, or twelve months' supply of electric lamps for the Municipal Sanatorium. Town Clerk.

Dublin.—Twelve months' supply of electrical fittings for South Dublin Guardians. Clerk, James's Street. March 10th.

Ilford.—Electric coal waggon for Electricity Department. Borough Electrical Engineer. March 9th.

Liverpool.—Twelve months' supply of electrical fittings for Poor Law Institution, Brownlow Hill. Clerk. March 12th.

Warrington.—Twelve months' supply of electrical goods for Guardians. Clerk, Bewsley Chambers.

The Institution of Civil Engineers.—H.M. the King of the Belgians and also Admiral Lord Fisher, First Sea Lord of the Admiralty, have accepted election as Honorary Members of the Institution of Civil Engineers.

Siemens' Dance.—A most successful dance was held at Mozart House, Albion Road, N.E., on Friday last, by members of the Siemens Dalston staff, and the company of about 70 who assembled much enjoyed the evening, which was made all the more interesting by some special features such as a "Mysterious Waltz" and a "Twilight Waltz," by the subdued light of multi-coloured lanterns. Great credit reflects upon the efforts of the committee, which consisted of Miss Maloney, Miss Topper, Mr. Dennison, and Mr. Pryor.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Blackpool.—The Electricity Committee has accepted the tender of the Davenport Engineering Co. for a cooling tower.

Bolton.—The tender of the British Thomson-Houston Co. has been accepted for the supply of switchgear.

Croydon.—A contract has been placed with Messrs. Babcock & Wilcox for a boiler, superheater, and economiser at £4,295; two chain-grate stokers at £920; and a motor-driven induced draught plant at £795.

Ipswich.—Ten tenders were received for coal-handling plant, and that of Messrs. Fraser & Chalmers has been accepted at £2,320 10s.

Tunbridge Wells.—The following tenders have been accepted:—Two water-tube boilers, the Stirling Boiler Co.; water-cooling towers, Messrs. Witting & Partners.

APPOINTMENTS AND PERSONAL NOTES

Mr. A. A. Campbell Swinton has been recommended for election as a Fellow of the Royal Society.

Switchboard attendants are required by the Blackpool Tower Co. and the Heywood, Bermondsey, and Portsmouth Electricity Departments.

The Accrington Electricity Committee recommends that Capt. Gray, the Chief Electrical Engineer, now on active service, shall have his army pay supplemented by a sum to make it equal to the salary he has received hitherto.

Mr. J. R. Lilleker has been appointed Assistant Electrical Engineer at Rotherham in succession to Mr. J. Williams, now Engineer and Tramways Manager at Erith.

LOCAL NOTES

Belfast: *Extensions Postponed Again.*—At the last monthly meeting of the Corporation it was announced that the proposed electric supply extension scheme at an estimated cost of £28,000 is not to be proceeded with for the present.

Coventry: *Lighting Small Property.*—A scheme has been prepared for giving a supply of electricity to workmen's dwellings on the following basis:—During May, June, and July the charge will be 6d. per week for houses with three lights and 7d. four lights; during April, August, and September, 7d. and 8d.; February, March, and October, 8d. and 10d.; November, December, and January, 9d. and 11d. Alternatively, a flat rate throughout of 7½d. per week for houses with three lights and 9d. per week for four lights is suggested. The charges include the provision and maintenance of lamps.

Darwen: *Coal Supply.*—The coal contractors to the Electricity Committee have notified that, owing to the reduction of output through workmen enlisting, they are compelled to reduce the supply by 25 per cent., or to charge 1s. 6d. per ton over the contract price for any coal delivered over 75 per cent. of the contract quantity.

Dublin: *Further Increased Charges.*—The Electricity Committee has created considerable concern among its consumers by announcing that it is compelled to increase the charges by a further ½d. per unit to that reported in our last issue, as far as lighting is concerned, and a further ¼d. per unit for power supply, making a 1d. and a ½d. increase respectively.

Llandudno: *New Plant.*—An additional 300-kw. generating set with induced draught plant has been ordered.

Rotherham: *Fire at Electricity Works.*—On Friday an accident to a rotary converter resulted in the dry air filter in connection with the turbo-alternator catching fire. Some damage was done. Mr. E. Cross, the Borough Electrical Engineer, and his staff were able to maintain the lighting supply, but the high-tension supply for power purposes had to be shut down until next morning.

Stoke-on-Trent: *Large Power Supply.*—A recommendation by the Electricity Committee that current should be supplied to Messrs. Keeeling & Walker, who propose to work a new electro-chemical process in the town, at a flat rate of ½d.

per unit, was the subject of considerable discussion at the last meeting of the Corporation. The supply, however, will commence at 3,000 units per week taken continuously over 132 hours weekly at E.H.T. three-phase. There is every prospect, according to the negotiations which have taken place, of the supply reaching 6,000 units per week, and it was explained on behalf of the Committee that the revenue from this will be a distinct income, as the current will be taken during the day-time principally. The recommendation has been sanctioned.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Harrods' Stores.—In the course of the meeting on Friday last, the chairman (Sir Alfred J. Newton) referred to the fact that the whole of the electricity for lighting and power is generated on the company's own premises at a cost comparing very advantageously with what they would have to pay to an outside company. The amount used would be sufficient to supply a provincial town of some 80,000 inhabitants.

Westminster Electric Supply Corporation.—The question of coal supply was dealt with by the Chairman and also by Sir Alexander Kennedy, F.R.S., the company's chief engineer, at the annual meeting on Wednesday last week. During the last half of 1914 coal cost the company 8d. per ton more than in the last half of 1913, but during the past six weeks there has been an increase of about 3s. The company has considerable reserves, and the Government has now put some ships at the service of electric lighting and gas companies, but as we have already pointed out, however, the freights on these are much higher than upon the boats taken from the companies compulsorily by the Government. As to the position of electric power supply in London, the Chairman merely remarked that the companies have withdrawn their Bill in deference to the wishes of the Government owing to present conditions.

The I.M.E.A.—In view of present circumstances, the Council of the I.M.E.A. has decided not to hold a Convention this year. As already mentioned in our columns, the President, Major H. Richardson, is on active service, and it is the intention to hold business meetings in London on Thursday and Friday, June 17th and 18th, for the transaction of routine business necessitated by the Articles of Association, and for the discussion of matters of general interest to the members. These meetings will be held at the Institution of Electrical Engineers, Victoria Embankment, and on Thursday, June 17th, a report prepared by Mr. A. S. Blackman (Chief Electrical Engineer, Sunderland) and Mr. T. Roles (Chief Electrical Engineer, Bradford), on behalf of the "Point-Five" Association, on "The Practical Result of the 'Point-Five' Tariff," will be read and discussed. In the afternoon a report by Mr. F. Ayton (Chief Electrical Engineer, Ipswich), on "The Use of Electric Vehicles in Municipal Services," will be presented, and there will afterwards be a parade and demonstration of electric vehicles. On Friday, June 18th, the Annual General Meeting will be held.

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £69 5s. to £69 15s. This is the same price as last week. By an unfortunate clerical error, the price last week was given erroneously as £59 5s. to £59 15s.

London Power Supply.—The L.C.C. has officially notified the London borough councils that, although its power Bill has been withdrawn this session, consideration is still being given to the question of what further action, if any, shall be taken with regard to the supply of electricity in and near London. Local authorities wishing to make observations on the subject are requested to submit them as soon as possible.

Wiremen's Wages.—The General Purposes Committee of the L.C.C. has recommended that 10½d. per hour and the hours of labour and rate of pay for overtime in accordance with the rules agreed between the London Electrical Masters' Association and the Electrical Trades' Union in August, 1914, be adopted.

Inquiries yesterday showed that the Electrical Trades' Union have not yet made their application to the London Electrical Masters' Association for the increased rate to 1s. per hour referred to in our last issue.

SUMMARY

WE publish a translation of an article from the *Berliner Tageblatt* on the efforts of Great Britain and America to make a permanent capture of Germany's electrical export trade. The article suggests that the "Kultur" should no longer be measured by the use of soap, but the consumption of electrical energy per head of population. On this basis Germany possibly comes out higher than England—the results of the soap test are not given in the article (p. 102).

No further loans to local authorities for extensions of electricity works, cable networks, &c., will now be sanctioned unless they are for the purpose of enabling Government contracts to be fulfilled. The situation, which will have a far-reaching effect on electricity supply undertakings, is reviewed in a special article on pp. 102 and 103.

WE are able this week to publish some further particulars with regard to the deputation to the Board of Trade on the question of coal supplies, and we also explain the true reason for the enormous increase in prices and the difficulties in obtaining deliveries of coal under contracts (p. 103).

IN a paper read before the Manchester Local Section of the Institution of Electrical Engineers, Mr. A. P. M. Fleming dealt with the training of youths for the industrial side of engineering (p. 104).

A FULL list of members of the I.M.E.A. Development Committee is given on p. 104.

OUR report of the petition for compulsory licences under the drawn-wire metal filament lamp patents

gives a résumé of the further evidence on behalf of the petitioner. Evidence for the respondents has not been called for at present, and the judge is considering the case (p. 105).

THE Oldham Chamber of Trade write objecting to some of the statements made in our article on "The Electrical Contractor and his 'Rights,'" in our issue of February 25th (p. 105).

THE chairman's address of Mr. W. H. Everett to the Calcutta Local Section of the Institution of Electrical Engineers contained a general review of electrical engineering in India ((p. 105).

A METER problem is discussed in our "Questions and Answers" columns (p. 106).

THE corrosion of iron pipes by tramway return currents was dealt with by Mr. H. E. Yerbury in a Paper read recently before the Institution of Civil Engineers. A paper by Mr. A. F. Bound urges the adoption of track circuit signalling on railways (p. 107).

AMONG the subjects of Specifications published last Thursday by the Patent Office are control of traction motors led by mercury-vapour rectifiers, the control of lighting circuits automatically by selenium cells, and the fixation of nitrogen. An application has been made for the suspension of an enemy-owned patent for sparking-plugs. Patents dealing with maximum demand indicators, instruments, and telegraphs are expiring after a full life of fourteen years (p. 108).

A DISCUSSION on communications in warfare has been held by the Students' Section of the Institution of Electrical Engineers (p. 109).

THE prospects of an increased electrical trade with Canada are extremely good. It will have to be sought, however; it will not come automatically. An interview with Mr. Hamilton Wickes, H.M. Trade Commissioner in Canada (who is now in London) appears on p. 109.

OUR Trade Section describes a new design of exciter field regulator and a charging apparatus for small cells (p. 110).

MAINS, services, and transformers are required at Darlington; a 500 kw. mixed pressure turbo-alternator at Hove; and mains, services, and meters at Kingston-on-Thames. Extensions are also contemplated at Hackney, Batley, Heywood, Wednesbury, and Barking. Hackney has borrowed £10,000 from the bank for extensions (p. 111).

THE award in the Kingstown arbitration is £3,068.—An inclusive tariff for hired cooking and heating apparatus has been discussed at Marylebone (p. 112).

AN increased dividend is paid by the British Insulated & Helsby Cables, Ltd., for 1914. The Metropolitan Electric Supply Co.'s dividend is one per cent. down (p. 112).

(For Arrangements for the Week see p. 112.)

THE UNIT OF "KULTUR": SOAP OR ELECTRICITY?

IT is estimated that the production of one of our greatest concerns, for instance, the Allgemeine Elektricitäts-Gesellschaft, would be sufficient to cover the whole requirements of England, for, in the year 1912, the consumption of electrical goods in England was only 3s. 2d. per head of population, as against 16s. in Germany. This throws an accidental light on the glorified 'Kultur' of the English people, for to-day, not merely the use of soap, but also the distribution of electrical energy can be designated as the measure of outward 'Kultur.'

This remarkable passage occurs in an article in a recent issue of the *Berliner Tageblatt*, which has been cut out and sent to us by one of our Swiss correspondents. The article, obviously intended for German and not British readers, is a clumsy endeavour to belittle the importance of our electrical industry, for in the attempt to prove its case, the Berlin paper quotes figures which show in themselves that this industry has afforded an enormous market for Germany, having bought, in fact, £1,721,000 worth of electrical goods from that country in 1913; this represents about 10 per cent. of Germany's total export of electrical goods.

The article, in the true unwashed spirit of German "Kultur," makes no bones about attacking the English industry from which Germany has derived so much profit in the past, and as it gives other interesting figures—and even expresses some home truths—we think it will interest our readers to have a translation of the remainder of it practically in full:—

"In 1912 the estimated value of electrical apparatus exported by Germany was £13,600,000, or 22½ per cent. of its whole production. In 1913 the value rose to £16,500,000. It can thus be assumed that the percentage of export by our bigger concerns is still greater, while, on the other hand, it is to be noted that, contrary to America, electrical firms of moderate and small size take their part to a larger extent, thanks to the excellent organisation of the German export trade." [The logic of this argument appears somewhat faulty.] "A considerable part of our export, well over half, crosses the ocean, while 35 per cent. went to the European countries at war with us, and 7 per cent. to Austria-Hungary. The value of the German exports to the hostile European states during 1913 was as follows: Belgium, £1,087,000 (being 6·58 per cent. of the total electrical exports from Germany), France, £915,000 (5·56 per cent.); England, £1,721,000 (10·41 per cent.), Russia, £1,980,000 (11·98 per cent.), Serbia, £14,600 (0·09 per cent.).

"England is trying to supplant German competition in electrical, as in all other industries, from the markets of the world, during the war, although she had to give way to this competition in times of peace, owing to the superiority of German goods and business methods. . . . England must import one-fifth of her own requirements, and in this fifth part Germany had a constantly increasing share.

"The electrical factories in England wish to replace German imports as much as possible by their own products, but it is admitted from the English side that they are not quite in a position to do so. The English works are short of skilled workmen, but the chief reason is that they are dependent on raw materials and component parts, which they have hitherto exclusively obtained from Germany, Austria, Belgium, and Sweden. For instance, only two incandescent lamp works made their bulbs themselves in England, while all others obtained theirs from the continent. There is only one arc lamp carbon factory in England, so that nearly all arc lamp electrodes must be imported. England has also hitherto been dependent on other countries for certain qualities of iron and steel, porcelain and glass parts, which, it is true, could be made in the country, but it is clear that such auxiliary industries cannot be suddenly evolved, and that years must elapse before a change can be made. With such obstacles it is easy to see that England's efforts to usurp our electrotechnical export, especially to oversea countries, will not have much success.

"During 1913 England exported something over £500,000 worth of electrical goods to South Africa, while the exports of Germany and Austria to those countries was valued at £425,000. Electrical machines constituted the major part of this export from Germany, this part being double as great as that delivered from England. It is characteristic that, according to the English Board of Trade, the foreign, and thus primarily the German merchants, achieve their success by holding large stocks, so that the mines can be supplied quickly. On the other hand, it is not mentioned in the English report, that the successes in the supply of machines depended on the excellent quality of the machines and on the technical thoroughness of the installations." [The Board of Trade reports state facts only.] "We need merely recall the large deliveries of steam turbines, turbo-compressors, and haulage installations which have in recent years been made from Germany to the Rand mines.

"The American electrical industry is naturally giving particular attention to the present circumstances. The American electrical export is relatively small, and last year amounted only to about £5,000,000. In addition it showed a tendency to diminish. The Americans hope to increase these figures during the war, but time alone can show to what extent the trade which they have perhaps now won will be retained. Their greatest hopes are placed in the Far East and in South America. According to the Japanese Consul in Chicago the electrical imports into Japan during 1913 amounted to about £1,375,000, of which only 20 per cent. was from the United States, 30 per cent. from England, and 50 per cent. from Germany. In Central and South America, the position is better for America. From July 1st, 1912, to June 30th, 1913, the imports for the most important countries are estimated as follows:—

Mexico: From Germany, £100,000; from England, £10,500; from America, £420,000.

Argentina: From Germany, £812,500; from England, £600,000; from America, £125,000.

Brazil: From Germany, £350,000; from England, £362,500; from America, £628,000.

Chili: From Germany, £250,000; from England, £135,000; from America, £250,000.

Total for the above four countries: From Germany, £1,512,500; from England, £1,108,000; from America, £1,423,000.

"Germany was certainly ahead here, and although it is maintained on the American side that it is now possible to gain the exports hitherto derived from England and Germany, yet this should hardly be possible. Above all, the receptive capacity of the Central and South American States is momentarily very small, as they have all been visited by severe commercial and financial crises. Exports to Mexico should be absolutely impossible under present political conditions. In addition there are the financial and transport difficulties. The Argentine Ambassador to the United States calls American merchants' attention to the fact that a payment 90 to 120 days after delivery is regarded in the Argentine as a cash payment, although this would be regarded as credit by American manufacturers. On all sides it is acknowledged that it is not only the German goods, but also the cleverness of the German business methods which have won their successes in export trade. The Secretary of the Department for Commerce of the United States explains that, particularly with regard to the South American market, a scheme which has a German financial backing, and is carried out under the direction of German engineers, will definitely call for German material. He urges the business and banking world of the United States to enter territory which is foreign to them by investment of capital in the South American States, as they then will obtain not only interest for their money, but also an increased sale of American goods. It is questionable, however, whether this appeal will have any effect, in view of the financial position in the South American republics already referred to. We have good reason to hope that our exports to these countries, which has not absolutely ceased during the war, will not only attain its former extent after the war, but will develop to an increasing extent."

Another leading German newspaper, the *Frankfurter Zeitung*, gives some significant information with regard to the probable future position in Russia, information which would appear to be accurate:

At a meeting of the Electrical Section of the Royal Russian Technical Society, attended by a representative gathering, the subject discussed was the means to make the Russian electrical industry independent of Germany in the future. One speaker stated that hitherto the Russian electrical industry had been almost completely under the control of Germany, and that actually the tungsten mines in the Ural district were owned by Krupp's.

EXTENSIONS OF ALL ELECTRICITY WORKS TO BE RESTRICTED

THE Government has decided that no loans for the purpose of expenditure on extensions to electricity works are to be authorised unless these extensions are required to enable firms engaged on Government contracts to continue their operations. This important announcement has been made in three places during the past week: by Mr. H. Ross Hooper at a Local Government Board inquiry at Heywood (Lancs.), in the Private Bill Committee Rooms in the House of Commons, and in a report by the Finance Committee of the L.C.C.

At the Local Government Board inquiry at Heywood last Friday, with regard to an application for sanction to borrow £12,480 for the electricity undertaking, Mr. H. Ross Hooper, chief inspector of the Local Government Board, stated that, acting in conjunction with the Treasury, the L.G.B. would sanction no loans for electricity works extensions except in

extraordinary circumstances involving facilities for the execution of Government contracts. Loans for expenditure on ordinary developments would not be sanctioned, but such work might be paid for out of revenue. The Chairman of the Electricity and Tramways Committee asked the definite question: "Are we not to supply fresh consumers who are making demands upon us?" and received the point-blank reply from Mr. Hooper: "Not if you cannot do it with your present works. You will have to tell them they must do without what they are asking for until the war is over."

The Treasury has been in communication with the Parliamentary authorities regarding restrictions to be placed upon the expenditure of money under Private Bills or Provisional Orders. As a consequence, there will be inserted in all Private Bills this session a clause to the following effect:—"During the continuance of the war, and twelve months thereafter, the consent of the Treasury shall be required to the raising or borrowing of any money under the powers conferred by this Act (or Order)."

At the meeting of the London County Council on Tuesday, the Finance Committee reported with regard to applications from Borough Councils for certain loans, including £5,000 for electricity mains at Battersea and £10,000 for the Hammersmith electricity undertaking. A communication had been received from the Treasury stating that Treasury approval is now required for all fresh borrowings by Local Authorities, and that approval would not be forthcoming in the absence of special considerations, and requesting that the applications for the loans in question should be reconsidered accordingly.

The position is summed up in the following official instruction:—"The approval of the Treasury should be obtained for all fresh issues of capital of whatever nature, whether made on behalf of a Government, municipality, or other public body, or any company, whether public or private."

The Hammersmith Borough Council will be placed in a peculiar position if the loan is refused, as the bulk of the money is required for mains and transformers, which have already been purchased; about a quarter of it was in order to keep a sum in hand for future extensions, so that in future there might be no expenditure in advance of their borrowing powers. Fortunately, the Council have a reserve fund which can be drawn upon in the event of the loan being refused. In Battersea, on the other hand, we believe that at any rate part of the expenditure contemplated is for the purpose of supplying power for the execution of Government contracts.

It is clear that the position will be a very difficult one for electricity undertakings. Fortunately, the "linking-up" scheme in London (see ELECTRICAL ENGINEERING, February 11th, p. 56), which is absolutely essential at the present time, will cost very little, and it will be immaterial whether this is paid for out of revenue or reserve fund if sanction for loans for capital expenditure is refused. The problem of dealing with applications for supply from new consumers, and for extensions by existing consumers is more complicated, however. To a certain extent these can be supplied by existing plant, and mains, &c., and can also to a limited degree be paid for out of revenue, but as the period during which no loans are to be sanctioned is indefinite, electricity undertakers will have to go cautiously. It has been suggested that application might be made to permit the suspension of contributions to sinking fund, but we hardly think that this would be permitted, as it would simply be prolonging the period of past loans, and would therefore have all the same objections from the Treasury point of view as sanction to a new loan. It is, however, an occasion upon which reserve funds should certainly be drawn upon for capital purposes, and also a firm stand should be taken against allocating any profits that may be made to relief of rates.

It will be interesting to see whether, in cases such as at Hammersmith, where the money applied for has been already partly spent on extensions to networks, &c., the loan will be allowed when the full circumstances are reported, or whether the money will have to come out of revenue or reserve fund. Another problem that will arise is whether it will not be necessary for some electricity works to reduce the number of their cable hands and canvassing staffs if practically all extension work has to be stopped.

We have already mentioned, but it will bear repetition, that no difficulties are likely to be placed in the

way of extensions for the genuine purpose of supplying power to firms engaged on Government contracts, whether for munitions of war, clothing, or other War Office necessities. If the extensions are required for such purposes, the details should be made clear and definite with the application for the loan, so that there may be no delay.

One point more must be mentioned. It is evident that some definite instances will arise in which electricity authorities, both company and municipal, will be unable to comply with requests for supply from new consumers, and will also have to refuse to consider extensions to existing ones. In these circumstances they might become liable to an action for not fulfilling their statutory obligations under the Electric Lighting Acts,* and a short Act of Parliament will be necessary to relieve them of this possible difficulty.

COAL SUPPLIES: DEPUTATION TO THE BOARD OF TRADE

A S announced briefly in our issue of last week, a deputation of electricity and gas works managers was received by the President of the Board of Trade on Wednesday last week, to lay before him the serious position with regard to coal supplies:

The deputation had been arranged primarily by the gas interests, and there were present representatives of the Institution of Gas Engineers, the Gas Companies' Protection Association, and the Conference of Gas Authorities in Scotland; Messrs. Bowden (Poplar), Calvert (Finchley), and Tapper (Stepney) attended as representatives of the Association of Municipal Electrical Engineers (Greater London), and Mr. Barge (Chairman of the Poplar Electricity Committee) for the Conference of Metropolitan Authorities owning Electric Supply Undertakings. Neither the Institution of Electrical Engineers nor the Incorporated Municipal Electrical Association, we believe, were invited to send official representatives, but Mr. Frank Bailey (City of London Electric Light Co.) was summoned by the gas companies at the last moment to speak on behalf of the electric lighting companies.

Sir Fortescue Flannery, Bart., M.P., introduced the deputation, and briefly mentioned that the electric light and gas undertakings were both affected by the present position. Sir Corbett Woodall (Gas Light & Coke Company) spoke first on the question generally, and was then followed by Dr. Carpenter (South Metropolitan Gas Company), who said that the South Metropolitan used a million tons of coal a year. He mentioned the importance of instructing the public as to the utilisation of coke, and said that in Germany no fuel was allowed to be burned in open grates unless it consisted of two-thirds coke. Another point which he raised was that a large amount of the bye-products of the gas works was required by the Government for the manufacture of explosives.

All the speakers explained the difficulties under which they were working owing to the shortage of coal supply, and although the high price of coal was incidentally alluded to, the main object of the deputation was to impress upon the Government the necessity of some steps being taken to facilitate and accelerate the transit of coal from the mines to the gas and electric light works. Mention was also made of the distress which the shortage was causing among the poorer classes. Mr. H. E. Jones (Commercial Gas Company) said that the Commercial Gas Company had 114,000 consumers, chiefly of the poorer class, 90 per cent. of whom were supplied through slot meters.

Mr. Frank Bailey said that until the present emergency the electric lighting companies had always had ample stocks of coal, but these were now getting seriously depleted. He mentioned that his Company supplied power to a large number of the newspapers in Fleet Street, who would be unable to print if the Company were prevented from supplying, due to coal shortage, and Mr. Runciman, in the course of his reply, caused some amusement by saying that perhaps the Censor's department would not mind this.

Mr. E. Allan (Past-President of the Institution of Gas Engineers) asked the Board of Trade to do all in its power to get as many as possible of the coal trucks which were being used exclusively for Government purposes released, as the holding up of these trucks had been one of the most serious causes of the trouble.

Bailie Irwin (Glasgow) said that in his city there are 290,000 consumers, 80,000 of whom were supplied through slot meters, and that the gas works used a million tons of coal a year. At one time their stock of coal had been nearly down to a fortnight's supply.

The President of the Board of Trade (Mr. Runciman) replied

* Electric Lighting (Clauses) Act, Sections 27 and 30.

only very briefly to the deputation, as he had another deputation waiting to see him upon a different subject. He referred to the difficulty of obtaining railway trucks, promised to give his best consideration to the facts placed before him, and said that he would be pleased to receive any further suggestions that might be put forward.

Before Mr. Runciman retired, Mr. Barge reminded him that several of the electricity works required coal to enable them to supply electrical energy to works which were engaged in executing Government contracts.

The arguments put forward by the deputation and the speeches made, unfortunately did not suggest any definite practical remedies which can be applied immediately. Energetic Government intervention is needed in two directions. In the first place, the carrying out of contracts made since the outbreak of the war should be insisted upon, and, in the second place, change in the destination of the coal before it reaches the original purchaser must be prevented. A step in the latter direction has already been taken by the Railway Executive Committee, who will now not accept transfers of coal, and have insisted since March 1st that all wagons must be labelled direct from the colliery to the consumer.

At a certain time last November, the supply of coal produced from the pits exceeded the demand, prices were exceptionally low, many users took advantage of the opportunity for ordering, and, in consequence, stocks accumulated at the railway sidings and yards. Then came the shortage, due to the diminished railway facilities, and wagon hire rose from the usual 9d. a ton to 2s. and even 8s. per ton. The coal factors, faced with the shortage, could not resist the temptation of raising prices and transferring coal on order under contracts to other customers who were ready to pay these higher prices. We know of one case in which a contract was entered into for coal last November at 10s. 9d. per ton; deliveries under this contract are already over 2,000 tons in arrear, and the works which had ordered it has actually been obliged to purchase coal—perhaps even its own coal—at 20s. per ton. The collieries and merchants claim that they are covered in such cases by the "restricted output" clause in the contracts!

The only bright spot of the whole business is the healthy increase in the demand for electric radiators.

INDUSTRIAL ENGINEERING TRAINING

A PAPER on "Training for the Industrial Side of Engineering," by Mr. A. P. M. Fleming, was read at a meeting of the Manchester Local Section of the Institution of Electrical Engineers recently. The author remarked that in this country, while a great deal of attention has been paid to the training of the technically-educated man, comparatively little has been done, other than by individual employers, to provide the best possible training for youths who are to become skilled workmen. After suggesting that more could be done by elementary teachers in observing which boys were likely to be suited to skilled handicrafts, he emphasised the need for some form of pre-apprenticeship training, and outlined some of the general requirements of practical training. In most engineering works, he said, no special facilities were provided for practical training, and an apprentice had to pick up experience in a haphazard fashion, although there were notable exceptions. In some works instructors were employed to see to the progress of apprentices. In others a separate training shop was provided.

It was interesting to see what was being done in other countries. In Germany youth are permitted to leave school at the age of 14, but must continue with their education for about eight hours per week throughout the period of apprenticeship. In Munich separate classes are arranged for each trade, in which, apart from the continuation of general education, both practical and theoretical instruction is given in the trade by skilled workmen and special instructors. In the larger industries in Northern Germany it is more usual for an apprentice school to be provided in each works, or collectively for several works. Apprenticeship in engineering trades extends over a period of four years, and at the end of this time an apprentice is required to present himself before a committee of experts who examine his knowledge of the trade, and if he is competent, award him a master certificate. In France there is no national scheme for the training of artisans, but in Paris and other centres evening and Sunday-morning classes afford opportunity for trade instruction, and there are certain day schools for the combined practical and trade instruction of young men who intend to become expert workmen or foremen. In Switzerland, continuation education embodying trade instruction is carried out on a plan similar to that in Germany. In the United States there is as yet no national scheme, although much has been done by individual employers in various industries. In companies such

as the Westinghouse and General Electric, most of the practical experience is gained in a special training shop.

In the British Westinghouse Co.'s training system, instruction averaging five hours per week is given during working hours to all "bound" apprentices, numbering altogether about 300, in a school situated in the works. The regular rate of wages is paid during the time spent in study, and the cost of books, &c., is borne by the firm. The teaching is done by members of the firm's staff. Each year about 10 apprentices are selected and sent for one whole day each week to the course for engineering apprentices at the Manchester Municipal School of Technology. The cost of tuition is borne by the firm. In addition to the arrangements for training "trades" apprentices, the Company has for the past 12 years trained "engineering" apprentices according to certain well-defined courses.

Having secured suitable material for trades apprenticeship, the function of the subsequent training is two-fold. One is to select those who possess ability to profit by technical instruction, and to provide facilities for their advancement to positions where their capabilities may be fully utilised. The other is to train youths lacking in such ability so as best to fulfil their function as workmen. In the efficient training of the latter two requirements must be provided—manual experience and trade instruction. In regard to manual instruction a separate training shop in a works offers many advantages; and, failing this, a special apprentice instructor. These means are, however, not universally applicable, and in their absence it is necessary for each employer to take steps to ensure that the staff give personal attention to the training of the apprentices under their charge. In most engineering works such attention is almost entirely lacking.

With regard to trade instruction, the author considered that the evening technical classes available in most industrial centres were quite unsuitable. Such education should be made directly applicable to the trades of the district, and apprentices should be compelled by their employers to attend classes for suitable instruction, which should preferably be arranged during the daytime. He thought that the apprenticeschool method of training offered many advantages, and should not be impracticable even in small works. In this connection, a series of handbooks dealing with instruction for apprentices in each of the engineering trades would be of value and would serve to keep instruction throughout the industry of the same character. As regard "engineering" apprentices, it is not so important that the training be arranged on such uniform lines on account of the widely differing range of experience that different firms have to offer. Attention was also directed in the Paper to the value of scientifically-trained men in works organisation, and to the fact that except in isolated cases the technical colleges have neglected to give attention to this field of employment.

THE I.M.E.A. DEVELOPMENT COMMITTEE

THE following is a complete list of the members of this Committee, including those co-opted at recent meetings:—

Representing the I.M.E.A.: S. E. Fedden (Sheffield) [Chairman], S. T. Allen (Wolverhampton), F. Ayton (Ipswich), A. S. Blackman (Sunderland), R. A. Chattock (Birmingham), A. C. Cramb (Croydon), Coun. Crowther (Sheffield), J. E. Edgecome (Kingston), Ald. Ellaway (Birmingham), F. M. Long (Norwich), H. Richardson (Dundee), Ald. Pearson (Bristol), H. F. Proctor (Bristol), T. Roles (Bradford), A. H. Seabrook (Marylebone), Ald. J. Smith (Barrow), W. A. Vignoles (Grimsby), G. Wilkinson (Harrogate), J. W. Beauchamp (West Ham) [Acting Hon. Sec.].

Representing the A.M.E.B. (Greater London): W. C. P. Tapper (Stepney).

Representing the B.E.A.M.A.: R. J. Ireland (British Thomson-Houston Co.), G. Maurice (General Electric Co.), H. C. Siddeley (Lancashire Dynamo Co.), D. N. Dunlop (Sec., B.E.A.M.A.).

Representing Electrical Contractors' Association: L. G. Tate (Sec.).

Representing Cable Makers' Association: L. B. Atkinson (W. T. Glover & Co., Ltd.).

Representing Association of Electrical Power Cos.: W. A. Chamien, A. de Turckheim (Sec.).

Representing British Electrical Federation: W. L. Madgen.

Representing Society for Electrical Development, U.S.A.: F. W. Wilcox.

Sub-committees have been appointed to deal with the following matters: *Publicity*, to be worked from London district; Sec., A. C. Cramb (Croydon); *Electrical Installations*, to be worked from the Bradford district; Sec., T. Roles (Bradford); and *Domestic Appliances*, to be worked from the Birmingham district; Sec., S. T. Allen (Wolverhampton).

Copper Difficulties in Switzerland.—Owing to the difficulty of obtaining copper, the Swiss electricity works have formed an association for the common purchase of copper.

DRAWN WIRE LAMP FILAMENTS

Compulsory Licence Applied for

THE hearing of the application by the Robin Electric Lamp Co., Ltd., for the grant of compulsory licences under several patents for drawing metal filaments, owned by the B.T.-H. and Siemens companies, terminated on Wednesday, last week, in a somewhat unexpected manner. At the conclusion of the evidence for the petitioner, counsel on both sides were asked to address the Court, without evidence being called for the respondents, and on the conclusion of their speeches (after we had gone to press), Mr. Justice Warrington intimated that he would consider the case.

After the evidence for the plaintiffs, published in our last issue, the following witnesses were called:—

Mr. L. J. Simon, a consulting engineer concerned with theatrical installations, said that he had to deal with something like 30,000 lamps per annum, none of which, however, were Association lamps. He admitted that he had difficulty in getting customers to buy non-Association lamps even at 6d. per lamp less, on account of the reputation of the Association lamps, due, he said, to the advertisement schemes of the Association firms. So far as the Robin double-filament lamp was concerned, he would not be prepared to pay more than an extra 1½d. per lamp over the prices for single filament lamps, as he believed that by the time one filament went through age, the bulbs would be comparatively black, and the efficiency of the second filament would not be anything like that of the first.

Mr. T. A. Rose (recalled) said that the American General Electric Co. sold drawn tungsten wire at 5 dollars per 1,000 ft. to licensed companies.

Mr. M. A. Adam was examined at some length with regard to the patents in question in order to explain his opinion that the difference in manufacture between a carbon and a drawn wire metal filament lamp should not necessitate the prices being so different as 6d. and 2s. 8d. He said that he did not know of any country outside the United Kingdom where the price of drawn-wire lamps was so high as in this country, and thought that this higher price was largely due to the advertising power of the people who have the lamp in hand.

A copy of the licence granted to the Ediswan Company under 19 patents (including the drawn-wire patents) by the B.T.-H., Siemens, and Osram Companies was produced, and it was pointed out that the agreed royalty was 10 per cent. of the net selling price for lamps to be used in the United Kingdom and 5 per cent. on lamps for export. Allowing 30 per cent. as trade discount, off the list price of 2s. 8d., and taking 10 per cent. of the net price, gave a royalty of 2½d., which in witness's opinion would be in conformity with the general principles as regards scale of royalties.

In cross-examination the witness admitted that he was not in the lamp trade, and that he had never seen a tungsten lamp made, although he was familiar with all the processes "on paper."

Mr. George Cave, K.C., M.P., at the Judge's suggestion, then summed up the case on behalf of the petitioners, and Mr. A. J. Walter, K.C., Mr. J. Hunter Gray, and Mr. H. A. Colefax, K.C., addressed his lordship on behalf of the respondents, after which Mr. W. R. Bousfield, K.C., replied for the petitioners, and the Judge intimated that he would consider the case as stated above.

THE ELECTRICAL CONTRACTOR AND HIS "RIGHTS"

M R. T. S. BUCKLEY, Secretary of the Oldham Chamber of Trade, has written us stating that the article under this heading in our issue of Feb. 25th does not correctly represent the relationship between the Oldham Corporation and the local contractors who are members of the Oldham Chamber of Trade. This relationship, he says, is of a most amicable character. The contractors now keep a stock of all sizes of motors from ¼ h.p. to 10 h.p., and when customers apply to the Corporation, the officials point out to them that they can obtain motors from the contractors, and direct their attention to the list of them which hangs near the counter. Since this arrangement came into operation, the motors supplied through the Corporation have steadily diminished until last year less than a dozen were so supplied by them, and the Corporation only supply them in cases where the contractor cannot agree with the would-be customer. There are some people, he adds, who are so particular that they think only a Corporation can supply such apparatus. With regard to the hiring of cookers, heaters, &c., he continues, when the original arrangements were made to do this the price of current was 2d. per unit, and no business could be done. Within the last few months, however, the Corporation has reduced the price to 1d. per unit, and have asked the contractors if they would undertake the hiring of this apparatus, which they willingly promised to try and arrange for, but find that the Manufacturers' Associa-

tion have altered their rules and now prohibit their members from entering into any agreement for hiring. This being so, and with a view to helping on the matter, the contractors undertook to do this individually. At the last meeting of the contractors and the electricity committee the latter expressed themselves satisfied with the arrangement for hiring of motors, and said that the trade had not suffered, but on the contrary had increased. The relationship between the Corporation and the contractors is most cordial, and the committee and officials easy to approach. In further proof of this I may state that the Corporation, having no show-room, asked the contractors to help them, and on two separate occasions displays of various appliances were arranged which were a distinct success. The Corporation further assisted by giving a concession in the price of current for these displays, and assisted by largely advertising them in the local papers.

We are glad to learn from Mr. Buckley that the relations between the electricity department and the contractors are amicable, but his figures do not necessarily show that the motor-hiring arrangement is successful, or that it promises well for the development of the heating and cooking load. He gives the number of motors supplied by the Corporation last year to consumers who could not come to terms with any of the contractors, but no inference can be drawn from this, as he does not give the number supplied by the contractors during the same period, to enable a comparison to be made.

ELECTRICAL ENGINEERING IN INDIA

THE chairman's address of Mr. W. H. Everett, read recently at a meeting of the Calcutta Local Section of the Institution of Electrical Engineers, gave some interesting details of the magnitude of the electrical industry in India. The electrical manufacturing industry, he said, was practically non-existent. As regards electrical imports, the total for electrical machinery, apparatus, etc., for 1913–14 was £1,062,000, as against £792,000 for the previous year. A very large percentage of this came from the United Kingdom. For example, of cables 91 per cent. was British against 4 per cent. from Germany and Austria. The lowest percentage in any class was in the case of lamps, of which 68 per cent. were British and 25 per cent. German and Austrian. Telegraph apparatus for the last year amounted to £6,900 (97 per cent. British) and telephone apparatus £23,400 (92 per cent. British). It was seen that the bulk of the electrical trade with India was from the United Kingdom, except in the case of lamps, as already mentioned, and fans, of which 28 per cent. came from America. Extensive developments are taking place in lighting and power schemes, and he drew particular attention to the large water-power schemes, for which India is famous. The Cauvery Falls scheme has a 92-mile, 35,000-volt line, a 58-mile, 32,500-volt line, and a 40-mile, 21,000-volt line. The Jhehum River scheme has a 65-mile, 30,000-volt line, and another using 60,000 volts. The highest pressure is 100,000 volts, used on a 43-mile transmission of the Tata Power Co. There is also a 15,000-volt line at Simla. Important developments are to be expected in electric traction in India. A very favourable report has been prepared on the question of converting of the more congested portion of the Eastern Bengal Railway, near Calcutta, to electric traction, and if this scheme is taken up it may lead to the utilisation of electric traction on other lines. Electric driving is extensively adopted in Government concerns, railway workshops, and elsewhere, but has not made the headway that might be expected in jute mills. In Calcutta, however, motors aggregating 2,136 are used for jute milling, and 1,853 h.p. for jute pressing. The h.p. of motors in the district for other purposes is as follows: flour milling, 2,475 h.p.; printing, 1,236 h.p.; machine shops, 1,296 h.p.; pumping, 603 h.p.; and lifts, 603 h.p. Electric street lighting is now becoming a familiar feature in Calcutta and Howrah, as well as in the hill stations and elsewhere.

The Physical Society.—At the annual meeting on Feb. 12th, the following officers were elected for the ensuing year:—
President: Sir J. J. Thomson. *Vice-Presidents who have filled the office of President*: Prof. G. C. Foster, Prof. W. G. Adams, Prof. R. B. Clifton, Prof. A. W. Reinold, Sir Arthur W. Rucker, Sir W. de W. Abney, Sir Oliver J. Lodge, Prof. S. P. Thompson, Dr. R. T. Glazebrook, Prof. J. Perry, Dr. C. Chree, Prof. H. L. Callendar, Prof. A. Schuster. *Vice-Presidents*: Mr. W. R. Cooper, Dr. A. Russell, F. E. Smith, Mr. R. S. Whipple, Dr. S. W. J. Smith and Dr. W. Eccles. *Foreign Secretary*: Dr. R. T. Glazebrook. *Treasurer*: Mr. W. Duddell. *Librarian*: Dr. S. W. J. Smith. *Other Members of Council*: Mr. S. D. Chalmers, Prof. G. W. O. Howe, Prof. J. W. Nicholson, Major W. A. J. O'Meara, Mr. C. C. Paterson, Mr. C. E. S. Phillips, Prof. A. W. Porter, Prof. O. W. Richardson, Prof. the Hon. R. J. Strutt, and Dr. W. E. Sumpner.

only very briefly to the deputation, as he had another deputation waiting to see him upon a different subject. He referred to the difficulty of obtaining railway trucks, promised to give his best consideration to the facts placed before him, and said that he would be pleased to receive any further suggestions that might be put forward.

Before Mr. Runciman retired, Mr. Barge reminded him that several of the electricity works required coal to enable them to supply electrical energy to works which were engaged in executing Government contracts.

The arguments put forward by the deputation and the speeches made, unfortunately did not suggest any definite practical remedies which can be applied immediately. Energetic Government intervention is needed in two directions. In the first place, the carrying out of contracts made since the outbreak of the war should be insisted upon, and, in the second place, change in the destination of the coal before it reaches the original purchaser must be prevented. A step in the latter direction has already been taken by the Railway Executive Committee, who will now not accept transfers of coal, and have insisted since March 1st that all wagons must be labelled direct from the colliery to the consumer.

At a certain time last November, the supply of coal produced from the pits exceeded the demand, prices were exceptionally low, many users took advantage of the opportunity for ordering, and, in consequence, stocks accumulated at the railway sidings and yards. Then came the shortage, due to the diminished railway facilities, and wagon hire rose from the usual 9d. a ton to 2s. and even 3s. per ton. The coal factors, faced with the shortage, could not resist the temptation of raising prices and transferring coal on order under contracts to other customers who were ready to pay these higher prices. We know of one case in which a contract was entered into for coal last November at 10s. 9d. per ton; deliveries under this contract are already over 2,000 tons in arrear, and the works which had ordered it has actually been obliged to purchase coal—perhaps even its own coal—at 20s. per ton. The collieries and merchants claim that they are covered in such cases by the "restricted output" clause in the contracts!

The only bright spot of the whole business is the healthy increase in the demand for electric radiators.

INDUSTRIAL ENGINEERING TRAINING

A PAPER on "Training for the Industrial Side of Engineering," by Mr. A. P. M. Fleming, was read at a meeting of the Manchester Local Section of the Institution of Electrical Engineers recently. The author remarked that in this country, while a great deal of attention has been paid to the training of the technically-educated man, comparatively little has been done, other than by individual employers, to provide the best possible training for youths who are to become skilled workmen. After suggesting that more could be done by elementary teachers in observing which boys were likely to be suited to skilled handicrafts, he emphasised the need for some form of pre-apprenticeship training, and outlined some of the general requirements of practical training. In most engineering works, he said, no special facilities were provided for practical training, and an apprentice had to pick up experience in a haphazard fashion, although there were notable exceptions. In some works instructors were employed to see to the progress of apprentices. In others a separate training shop was provided.

It was interesting to see what was being done in other countries. In Germany youth are permitted to leave school at the age of 14, but must continue with their education for about eight hours per week throughout the period of apprenticeship. In Munich separate classes are arranged for each trade, in which, apart from the continuation of general education, both practical and theoretical instruction is given in the trade by skilled workmen and special instructors. In the larger industries in Northern Germany it is more usual for an apprentice school to be provided in each works, or collectively for several works. Apprenticeship in engineering trades extends over a period of four years, and at the end of this time an apprentice is required to present himself before a committee of experts who examine his knowledge of the trade, and if he is competent, award him a master certificate. In France there is no national scheme for the training of artisans, but in Paris and other centres evening and Sunday-morning classes afford opportunity for trade instruction, and there are certain day schools for the combined practical and trade instruction of young men who intend to become expert workmen or foremen. In Switzerland, continuation education embodying trade instruction is carried out on a plan similar to that in Germany. In the United States there is as yet no national scheme, although much has been done by individual employers in various industries. In companies such

as the Westinghouse and General Electric, most of the practical experience is gained in a special training shop.

In the British Westinghouse Co.'s training system, instruction averaging five hours per week is given during working hours to all "bound" apprentices, numbering altogether about 300, in a school situated in the works. The regular rate of wages is paid during the time spent in study, and the cost of books, &c., is borne by the firm. The teaching is done by members of the firm's staff. Each year about 10 apprentices are selected and sent for one whole day each week to the course for engineering apprentices at the Manchester Municipal School of Technology. The cost of tuition is borne by the firm. In addition to the arrangements for training "trades" apprentices, the Company has for the past 12 years trained "engineering" apprentices according to certain well-defined courses.

Having secured suitable material for trades apprenticeship, the function of the subsequent training is two-fold. One is to select those who possess ability to profit by technical instruction, and to provide facilities for their advancement to positions where their capabilities may be fully utilised. The other is to train youths lacking in such ability so as best to fulfil their function as workmen. In the efficient training of the latter two requirements must be provided—manual experience and trade instruction. In regard to manual instruction a separate training shop in a works offers many advantages; and, failing this, a special apprentice instructor. These means are, however, not universally applicable, and in their absence it is necessary for each employer to take steps to ensure that the staff give personal attention to the training of the apprentices under their charge. In most engineering works such attention is almost entirely lacking.

With regard to trade instruction, the author considered that the evening technical classes available in most industrial centres were quite unsuitable. Such education should be made directly applicable to the trades of the district, and apprentices should be compelled by their employers to attend classes for suitable instruction, which should preferably be arranged during the daytime. He thought that the apprentices-school method of training offered many advantages, and should not be impracticable even in small works. In this connection, a series of handbooks dealing with instruction for apprentices in each of the engineering trades would be of value and would serve to keep instruction throughout the industry of the same character. As regard "engineering" apprentices, it is not so important that the training be arranged on such uniform lines on account of the widely differing range of experience that different firms have to offer. Attention was also directed in the Paper to the value of scientifically-trained men in works organisation, and to the fact that except in isolated cases the technical colleges have neglected to give attention to this field of employment.

THE I.M.E.A. DEVELOPMENT COMMITTEE

THE following is a complete list of the members of this Committee, including those co-opted at recent meetings:—

Representing the I.M.E.A.: S. E. Fedden (Sheffield) [Chairman], S. T. Allen (Wolverhampton), F. Ayton (Ipswich), A. S. Blackman (Sunderland), R. A. Chattock (Birmingham), A. C. Cramb (Croydon), Coun. Crowther (Sheffield), J. E. Edgcome (Kingston), Ald. Ellaway (Birmingham), F. M. Long (Norwich), H. Richardson (Dundee), Ald. Pearson (Bristol), H. F. Proctor (Bristol), T. Roles (Bradford), A. H. Seabrook (Marylebone), Ald. J. Smith (Barrow), W. A. Vignoles (Grimsby), G. Wilkinson (Harrogate), J. W. Beauchamp (West Ham) [Acting Hon. Sec.].

Representing the A.M.E. (Greater London): W. C. P. Tapper (Stepney).

Representing the B.E.A.M.A.: R. J. Ireland (British Thomson-Houston Co.), G. Maurice (General Electric Co.), H. C. Siddeley (Lancashire Dynamo Co.), D. N. Dunlop (Sec., B.E.A.M.A.).

Representing Electrical Contractors' Association: L. G. Tate (Sec.).

Representing Cable Makers' Association: L. B. Atkinson (W. T. Glover & Co., Ltd.).

Representing Association of Electrical Power Cos.: W. A. Chamen, A. de Turckheim (Sec.).

Representing British Electrical Federation: W. L. Madgen.

Representing Society for Electrical Development, U.S.A.: F. W. Wilcox.

Sub-committees have been appointed to deal with the following matters: *Publicity*, to be worked from London district; Sec., A. C. Cramb (Croydon); *Electrical Installations*, to be worked from the Bradford district; Sec., T. Roles (Bradford); and *Domestic Appliances*, to be worked from the Birmingham district; Sec., S. T. Allen (Wolverhampton).

Copper Difficulties in Switzerland.—Owing to the difficulty of obtaining copper, the Swiss electricity works have formed an association for the common purchase of copper.

DRAWN WIRE LAMP FILAMENTS Compulsory Licence Applied for

THE hearing of the application by the Robin Electric Lamp Co., Ltd., for the grant of compulsory licences under several patents for drawing metal filaments, owned by the B.T.-H. and Siemens companies, terminated on Wednesday, last week, in a somewhat unexpected manner. At the conclusion of the evidence for the petitioner, counsel on both sides were asked to address the Court, without evidence being called for the respondents, and on the conclusion of their speeches (after we had gone to press), Mr. Justice Warrington intimated that he would consider the case.

After the evidence for the plaintiffs, published in our last issue, the following witnesses were called:—

Mr. L. J. Simon, a consulting engineer concerned with theatrical installations, said that he had to deal with something like 30,000 lamps per annum, none of which, however, were Association lamps. He admitted that he had difficulty in getting customers to buy non-Association lamps even at 6d. per lamp less, on account of the reputation of the Association lamps, due, he said, to the advertisement schemes of the Association firms. So far as the Robin double-filament lamp was concerned, he would not be prepared to pay more than an extra 1½d. per lamp over the prices for single filament lamps, as he believed that by the time one filament went through age, the bulbs would be comparatively black, and the efficiency of the second filament would not be anything like that of the first.

Mr. T. A. Rose (recalled) said that the American General Electric Co. sold drawn tungsten wire at 5 dollars per 1,000 ft. to licensed companies.

Mr. M. A. Adam was examined at some length with regard to the patents in question in order to explain his opinion that the difference in manufacture between a carbon and a drawn wire metal filament lamp should not necessitate the prices being so different as 6d. and 2s. 8d. He said that he did not know of any country outside the United Kingdom where the price of drawn-wire lamps was so high as in this country, and thought that this higher price was largely due to the advertising power of the people who have the lamp in hand.

A copy of the licence granted to the Ediswan Company under 19 patents (including the drawn-wire patents) by the B.T.-H., Siemens, and Osram Companies was produced, and it was pointed out that the agreed royalty was 10 per cent. of the net selling price for lamps to be used in the United Kingdom and 5 per cent. on lamps for export. Allowing 30 per cent. as trade discount, off the list price of 2s. 8d., and taking 10 per cent. of the net price, gave a royalty of 2½d., which in witness's opinion would be in conformity with the general principles as regards scale of royalties.

In cross-examination the witness admitted that he was not in the lamp trade, and that he had never seen a tungsten lamp made, although he was familiar with all the processes "on paper."

Mr. George Cave, K.C., M.P., at the Judge's suggestion, then summed up the case on behalf of the petitioners, and Mr. A. J. Walter, K.C., Mr. J. Hunter Gray, and Mr. H. A. Colefax, K.C., addressed his lordship on behalf of the respondents, after which Mr. W. R. Bousfield, K.C., replied for the petitioners, and the Judge intimated that he would consider the case as stated above.

THE ELECTRICAL CONTRACTOR AND HIS "RIGHTS"

M. R. T. S. BUCKLEY, Secretary of the Oldham Chamber of Trade, has written us stating that the article under this heading in our issue of Feb. 25th does not correctly represent the relationship between the Oldham Corporation and the local contractors who are members of the Oldham Chamber of Trade. This relationship, he says, is of a most amicable character. The contractors now keep a stock of all sizes of motors from ¼ h.p. to 10 h.p., and when customers apply to the Corporation, the officials point out to them that they can obtain motors from the contractors, and direct their attention to the list of them which hangs near the counter. Since this arrangement came into operation, the motors supplied through the Corporation have steadily diminished until last year less than a dozen were so supplied by them, and the Corporation only supply them in cases where the contractor cannot agree with the would-be customer. There are some people, he adds, who are so particular that they think only a Corporation can supply such apparatus. With regard to the hiring of cookers, heaters, &c., he continues, when the original arrangements were made to do this the price of current was 2d. per unit, and no business could be done. Within the last few months, however, the Corporation has reduced the price to 1d. per unit, and have asked the contractors if they would undertake the hiring of this apparatus, which they willingly promised to try and arrange for, but find that the Manufacturers' Associa-

tion have altered their rules and now prohibit their members from entering into any agreement for hiring. This being so, and with a view to helping on the matter, the contractors undertook to do this individually. At the last meeting of the contractors and the electricity committee the latter expressed themselves satisfied with the arrangement for hiring of motors, and said that the trade had not suffered, but on the contrary had increased. The relationship between the Corporation and the contractors is most cordial, and the committee and officials easy to approach. In further proof of this I may state that the Corporation, having no show-room, asked the contractors to help them, and on two separate occasions displays of various appliances were arranged which were a distinct success. The Corporation further assisted by giving a concession in the price of current for these displays, and assisted by largely advertising them in the local papers.

We are glad to learn from Mr. Buckley that the relations between the electricity department and the contractors are amicable, but his figures do not necessarily show that the motor-hiring arrangement is successful, or that it promises well for the development of the heating and cooking load. He gives the number of motors supplied by the Corporation last year to consumers who could not come to terms with any of the contractors, but no inference can be drawn from this, as he does not give the number supplied by the contractors during the same period, to enable a comparison to be made.

ELECTRICAL ENGINEERING IN INDIA

THE chairman's address of Mr. W. H. Everett, read recently at a meeting of the Calcutta Local Section of the Institution of Electrical Engineers, gave some interesting details of the magnitude of the electrical industry in India. The electrical manufacturing industry, he said, was practically non-existent. As regards electrical imports, the total for electrical machinery, apparatus, etc., for 1913-14 was £1,062,000, as against £792,000 for the previous year. A very large percentage of this came from the United Kingdom. For example, of cables 91 per cent. was British against 4 per cent. from Germany and Austria. The lowest percentage in any class was in the case of lamps, of which 68 per cent. were British and 25 per cent. German and Austrian. Telegraph apparatus for the last year amounted to £6,900 (97 per cent. British) and telephone apparatus £23,400 (92 per cent. British). It was seen that the bulk of the electrical trade with India was from the United Kingdom, except in the case of lamps, as already mentioned, and fans, of which 28 per cent. came from America. Extensive developments are taking place in lighting and power schemes, and he drew particular attention to the large water-power schemes, for which India is famous. The Cauvery Falls scheme has a 92-mile, 35,000-volt line, a 58-mile, 32,500-volt line, and a 40-mile, 21,000-volt line. The Jhehum River scheme has a 65-mile, 30,000-volt line, and another using 60,000 volts. The highest pressure is 100,000 volts, used on a 43-mile transmission of the Tata Power Co. There is also a 15,000-volt line at Simla. Important developments are to be expected in electric traction in India. A very favourable report has been prepared on the question of converting of the more congested portion of the Eastern Bengal Railway, near Calcutta, to electric traction, and if this scheme is taken up it may lead to the utilisation of electric traction on other lines. Electric driving is extensively adopted in Government concerns, railway workshops, and elsewhere, but has not made the headway that might be expected in jute mills. In Calcutta, however, motors aggregating 2,136 are used for jute milling, and 1,853 h.p. for jute pressing. The h.p. of motors in the district for other purposes is as follows: flour milling, 2,475 h.p.; printing, 1,236 h.p.; machine shops, 1,296 h.p.; pumping, 603 h.p.; and lifts, 603 h.p. Electric street lighting is now becoming a familiar feature in Calcutta and Howrah, as well as in the hill stations and elsewhere.

The Physical Society.—At the annual meeting on Feb. 12th, the following officers were elected for the ensuing year:—
President: Sir J. J. Thomson. *Vice-Presidents who have filled the office of President*: Prof. G. C. Foster, Prof. W. G. Adams, Prof. R. B. Clifton, Prof. A. W. Reinold, Sir Arthur W. Rucker, Sir W. de W. Abney, Sir Oliver J. Lodge, Prof. S. P. Thompson, Dr. R. T. Glazebrook, Prof. J. Perry, Dr. C. Chree, Prof. H. L. Callendar, Prof. A. Schuster. *Vice-Presidents*: Mr. W. R. Cooper, Dr. A. Russell, F. E. Smith, Mr. R. S. Whipple, Dr. S. W. J. Smith and Dr. W. Eccles. *Foreign Secretary*: Dr. R. T. Glazebrook. *Treasurer*: Mr. W. Duddell. *Librarian*: Dr. S. W. J. Smith. *Other Members of Council*: Mr. S. D. Chalmers, Prof. G. W. O. Howe, Prof. J. W. Nicholson, Major W. A. J. O'Meara, Mr. C. C. Paterson, Mr. C. E. S. Phillips, Prof. A. W. Porter, Prof. O. W. Richardson, Prof. the Hon. R. J. Strutt, and Dr. W. E. Sumpner.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive reply in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,433.

I am in charge of an accumulator battery. One cell gives me plenty of trouble. Its peculiarity is that the specific gravity falls during charging, and recovers during the discharge. The plates are in good condition, and have a clearance of 6 in. between lower edges of plates and bottom of cell, which is a teak lead lined tank. There are no shorts in the cell, and the sediment was taken out to be sure that there was no fouling due to it. The battery is not yet three years old. The sulphuric acid was 1.840° S.G. before mixing with the distilled water, and when mixed the electrolyte was 1.180 S.G. There is also no temperature variation in the battery room during the charge. What is the probable cause of the trouble?—"H. C. P." (Hong Kong).

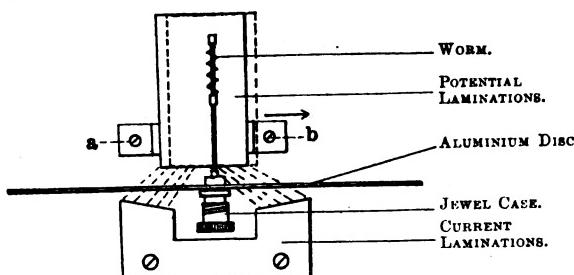

(Answers must be received not later than first post Thursday, March 18th.)

ANSWERS TO No. 1,431.

I am in a sub-station where 11,500 volts, 25 cycles is transformed down to 550 for tramway service; on the transformer panel there is a watt-hour meter, a power-factor meter, and an ammeter. The voltage is transformed down to 110 volts for those instruments through potential transformers. The watt-hour meter will work all right on full load, but when the load is light it starts to run backwards. Why is this? Please also state if a 50-cycle power-factor meter will work satisfactorily on a 25-cycle circuit.—"W. M."

The first award (10s.) is given to "J. W. D." for the following reply :

As "W. M." states that the meter works all right on full load, it must be concluded that the connections are correct. The question does not state whether the discs rotate on shunt

DIAGRAMMATIC SKETCH WITH COILS OMITTED.

or not—that is, when only the potential coils are connected up. However, I will take it for granted that there is no shunt running, although this can be tested by disconnecting the current coils, leaving the potential coils connected. Then, if the discs rotate, which will be very slight, if at all, the position of the pole pieces will have to be re-set, thus altering the speed, and hence the calibration. After the shunt-running test has been carried out, disconnect the potential coils and apply approximately full load to the current coils, when it will probably be found that the discs will rotate in the wrong direction, this being called current-running, which will have the effect of causing the magnet discs to rotate backward at light load. The effect of the magnet

flux on a disc in such a case is shown by the accompanying sketch. As it is seen, the position of the current and potential poles are not in a straight line, consequently the flux is of greater density on one side than on the other, thus causing unequal eddy-currents in the disc, and hence rotation commences. To remedy this effect, slacken the screws (a) (b) which are supporting the potential pole-piece by means of brackets, and then move the laminations in the direction of the arrow to the position marked by dotted lines. It must be moved a little at a time, until there is no tendency of the disc to run. I assume the meter to be polyphase, consequently this test will be better carried out by having only one set of coils connected at a time, and making the necessary adjustments separately. Of course, if the laminations are short-circuiting, shunt-running or current-running may occur even when the potential and current coils are in a line. The movement of the poles alters the calibration of the meter, and will therefore require to be checked up, this adjustment being effected by the braking magnets.

A power-factor meter will not work correctly if connected to a supply of frequency to which the coils have not been wound, for although devices may be fitted to compensate for frequency changes, it would not have sufficient effect in such extreme cases. The reason is this : The action of the power-factor meter works on the principle of the rotating magnetic field system (not the pole-pieces). The pressure coils are pivoted, and rotate within the current coils. The magnetic flux produced by the potential coils is 90° behind the applied pressure. At unity power-factor the current is in phase with the pressure, and consequently the magnetic fields of the current coils rotate or coincide with those of the pressure coils. If an inductive load comes on, thus causing a lagging current, it follows that the magnetic field of the current coils will rotate at an angle slightly behind those produced by the pressure coils, the magnitude of this angle depending on the amount of phase displacement caused by the inductive load. Now as the pressure coils are wound for 50 cycles instead of for 25 cycles, there is a less number of turns in the former than on the latter, consequently the transformer E.M.F. will not be produced with the proper phase angle; hence an error occurs, due to the rotating magnetic fields not making the correct phase-displacement corresponding to different natures of loads.

The second award (5s.) is made to "OHM," who writes as follows :—

Full particulars of the system are not given in the question, but it is evident that the high-tension supply is three-phase three-wire, and therefore the meter complained of is an ordinary two-element induction meter, suitable for this class of service, operated from current and potential transformers. With an arrangement of this kind the current coil of element No. 1 is connected, for example, in Phase 1, with the potential winding between Phases 1 and 2, and element No. 2 in Phase 3, with the potential winding between Phases 3 and 2. If, therefore, the phase rotation is of the order 1, 2, 3, and the phase currents are lagging, then we get :—

Torque of element No. 1 is proportional to $C_1 V \cos(30 + \theta)$, and torque of element No. 2 is proportional to $C_2 V \cos(30 - \theta)$, where C_1 = current in Phase 1, C_2 = current in Phase 3, V = voltage between phases, and $\cos \theta$ = power factor.

It should be noted that as the power factor diminishes—corresponding to an increase in θ —the torque of element No. 2 will gradually increase to a maximum and then decrease, providing the current load does not alter. In the case of element No. 1, however, a reversal of the torque will occur when $\theta = 60^\circ$. In other words, when the power factor is 0.5, the torque due to element No. 1 will be zero, and furthermore for lower power factors the torque will reverse and the meter discs would therefore change their direction of rotation. This, of course, would only occur if element No. 2 was inoperative. As "W. M." has observed this effect when the load is light—that is, when the power factor is low—the evidence is fairly conclusive that element No. 2 is defective, due most probably to a break in the potential circuit. Regarding the last portion of the question, it can be assumed, as a general rule, that a power-factor indicator will give quite reliable indication on any frequency within the limits met with in practice. The reason is that the potential circuits of such an instrument are non-inductive—as in a wattmeter—so that the currents flowing through them are independent of the frequency.

QUESTION No. 1,429.

M. J. L. writes us as follows :—

"I would be very pleased if I may be allowed to ask 'C. S. B.' a question through your paper with regard to his reply to Question 1,429. In the first place I do not say that he is wrong, but there is one item which has interested me, and that is as follows : He says that when the stator switch is closed, the pressure induced in the rotor windings will be approx. 200 volts. I would be very pleased indeed if he could say how he came at the above figure, as I myself have always been under the impression that with the rotor standing still the currents and E.M.F.'s in the rotor would be considerable, as the cutting of the lines of force would now be at the greatest rate. Also in order that the rotor should generate full-load current with all the resistances in circuit, it is necessary that considerable E.M.F. should be generated in the rotor windings."

ANSWERS TO CORRESPONDENTS

T.C.C.—You will be able to obtain the information that you desire from the Secretary of the Institution of Electrical Engineers, Victoria Embankment, W., and the Secretary of the Association of Supervising Electricians, 14 Pulborough Road, Southfields, S.W.

C. VOGELEZANG.—The address that you ask for is Messrs. Chamberlain & Hookham, Ltd., 4 New Bartholomew Street, Birmingham.

ELECTRIC TRACTION NOTES

The corrosion of water and gas mains by tramway return currents, and means for providing against other electrical disturbances, were dealt with by Mr. H. E. Yerbury in a Paper read on Feb. 23rd before the Institution of Civil Engineers. The author discussed various theories of corrosion, and said that white cast-iron was less susceptible to corrosion than pig-iron, as it contained less graphitic carbon and silicon. Concrete conducted electrolytically and electrolysis was attributed in certain cases to impurities, such as calcium sulphate, added to retard setting. The measures used to limit the potential difference between the track and the pipes were discussed and the negative booster system explained. The ideal system was for the boosted and unboosted return conductors to be kept at the same potential, but if the potential of the rails, at some point where a negative boosted conductor is bonded, is lowered to an abnormal degree, it follows that pipes carrying a leakage current are invited to give up their charge, as the difference of potential is thereby increased. This fact is appreciated by the Board of Trade, as one regulation stipulates that the direction of the current should be reversed by interposing one Leclanché cell (1·48 volt) if the current is from the pipe to the return, whereas up to 4·4 volts are allowed where the direction of the current is from the uninsulated return to any pipe in the vicinity. As current-density and duration of current are the most important factors in connection with electrolytic action on pipes, potential readings are somewhat misleading, as it is now well known that where a comparatively high difference of potential exists there is, as a rule, less injurious current passing. This is largely attributable to the counter electromotive force of polarisation. The Board of Trade regulations in respect to leakage currents can easily be complied with, and are absolutely effective in safeguarding the property of other authorities. As 650 volts are allowed as a generating or transforming pressure, in the author's opinion up to 600 volts could be allowed between overhead conductors and earth, as 10 per cent. is often the maximum drop on a tramway system. This increase of voltage would reduce the cost of feeders and also the heavy currents now dealt with. It was important that metallic connections to the rails, such as bonds from tramway-poles and feeder-pillars, should be as few as possible, and all pipes should be kept at least 2 ft. from the track. All rail-joints should be tested periodically. Where joints are welded, a copper bond is recommended as a precautionary measure in case of a high resistance being set up by a badly welded joint, which resistance in course of time would be intensified by additional oxidation. The latter part of the Paper dealt briefly with some aspects of the question of interference of single-phase traction currents with telephone and telegraph circuits.

In a paper read recently before the Institution of Railway Signal Engineers by Mr. A. F. Bound, the author reviewed some of the changes occurring in railway conditions, and contended that the time had come when the ordinary block system was not sufficient protection, and that, in view of the fact that we were now passing through a period in which accidents were due not to failure of the machine but of the human element, we must use something more in the direction of automatic signalling. He outlined a system of track-circuit signalling, and showed how he would propose to introduce this gradually in several styles until a complete system of automatic protection was reached.

It is anticipated that the electrification of the North-Eastern line between Shildon and Newport will be completed this summer.

Notwithstanding an increase in expenditure last year of £7,000 and a decrease in revenue, the Hull Corporation Tramways Committee has decided to grant £10,000 for relief of rates. This is £3,000 more than in the previous twelve months.

At the annual meeting of the London Brighton & South Coast Railway Co. last week, only a brief reference was made to the electric traction scheme, and this took the form of pointing out that the electrical services running in the districts between Victoria and London Bridge, Victoria and Crystal Palace, and London Bridge and Crystal Palace in particular have shown marked expansion. No reference was made to the position of the Company in regard to the electrical extensions now in hand, owing to the war and to the fact that the main contracts were placed in German hands.

The controversy with regard to the advisability of the Bristol Corporation purchasing the Bristol Tramways & Carriage Co.'s undertaking, as it has powers to do in an Act obtained last session, still continues to excite much interest in Bristol. The Corporation experts have estimated that the undertaking is worth £670,000, but Sir George White, the Chairman of the Company, says that the claim will be something like £2,000,000. The Special Committee of the Corporation which is dealing with the matter has invited the directors of the Company to a conference with a view to arriving at an amicable arrangement.

At the annual meeting of the North London Railway Co. last week, reference was made to the delay in the electrification scheme in conjunction with the London & North Western Railway Co. due to the war. It had been hoped to complete this work by the spring of this year, but this is now quite beyond the bounds of possibility. A similar state of affairs exists with regard to the London & North Western Railway Co., but it is hoped that by the end of the present year to have the new service between Broad Street, Kew, and Richmond in working order. The sum of £249,716 has been advanced to the London Electric Co. as part of the £1,000,000 which it has been agreed to lend them in connection with the new extensions from Paddington to Queen's Park.

Owing to difficulty in obtaining supplies of tram rails from its English contractor, the Birmingham Tramways Committee asks sanction to purchase 2,000 tons of rails and fish-plates from the Lorain Steel Co., U.S.A.

The British Association.—It is announced that the Council has decided to hold the annual meeting of the Association next September as previously arranged. It is felt, however, that it would be inexpedient, in present conditions, to carry out the usual social arrangements in connection with the meeting, and in order to continue the long continuity, the meetings will be restricted to the purely scientific functions. The meeting is to be at Manchester.

The Firing of Mines.—The second part of the discussion on the applications of electricity in warfare at the meeting of the Students' Section of the Institution of Electrical Engineers last week, dealing with the firing of mines and explosives, was opened by Mr. S. Killingback, who said that the advantages of electrical means for firing mines might be briefly summarised as : Convenience, greater reliability, remote control, and simultaneous firing of several charges. Mines and explosives may be fired either by accumulators or by the portable hand-operated service dynamo. The standard types of electric fuses and detonators require a current of about 0·8 ampere for fusing. Mr. Emtage asked why platinum-iridium wires were employed in the standard service fuses, and expressed an opinion that trinitrotoluene was superseding guncotton and gunpowder in the fuses. Mr. Heslop referred to the fact that electrical firing of mines was not employed in the Russo-Japanese war, and that the chief field for electrical firing of mines was for harbour protection as reliable connections and cables could then be laid. The ordinary time fuses are generally satisfactory in other cases. The Chairman (Mr. Duddell) referred to the exploder captured from the Boers (which was of German make even at that time), that was now preserved in the Institution Library. The third portion of the discussion on "Searchlights and Projectors" will be opened by Mr. E. L. M. Emtage on March 31st. The first part is referred to under "Telephony and Telegraphy."

Western Local Section of the Institution of Electrical Engineers.—The following are the Council's nominations for the vacancies that will occur among the officers and committee:—Chairman, Mr. D. E. Roberts, Cardiff. Vice-Chairman, Prof. D. Robertson, Bristol. Nominations to fill five places on the Committee:—Messrs. A. J. Abraham (Aberdare), M. T. Evans (Bristol), R. H. Fletcher (Llanishen), W. W. Hughes (Swansea), A. C. McWhirter (Cardiff), W. G. Heath (Plymouth), C. W. Salt (Torquay), A. L. Stephens (Bristol). Any other nominations must be proposed and seconded, and an intimation in writing from those nominated that they will be willing to serve if elected, must be received not later than March 15th.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 4th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

2,959/14. Electric Traction. B.T.-H. Co. (*G.E. Co., U.S.A.*). A method of controlling series motors supplied with pulsating unidirectional current, such as can be derived from a mercury vapour rectifier, in which a non-inductive resistance in parallel with the field winding diverts the alternating component of the current. (One figure.)

3,596/14. Brush-holders. B.T.-H. Co. and F. P. WHITAKER. A box-type brush-holder having a spring arranged to exert pressure on the brush in a radial and tangential direction, so that the brush is pressed against the rear side of the pocket at the top and the front side of the pocket at the bottom, and is thus held steady in its natural position. (One figure.)

4,432/14. Heaters. H. HIRST and C. H. ARCHER. A heating element comprising a rod of insulating and refractory material with the resistance wire wound in a deep helical groove, and connected to end collars. A metal strengthening rod passes through an axial hole in the refractory rod. (Two figures.)

7,440/14. Light Control. C. J. TURNER. Apparatus for automatic control of lighting circuits by the variation of resistance of selenium with illumination. The selenium cell is connected in series with an electro-magnetically actuated mercury break switch.

9,638/14. Telephone Receiver. E. C. R. MARKS (*Electrical Experiment Co., New York*). A telephone receiver with a rigid diaphragm permitted to vibrate as a whole by being mounted between resilient rubber tube rings. Its movement is aperiodic, and a fine tone is obtained. (Two figures.)

22,586/14. Fixation of Nitrogen. Soc. GÉNÉRALE DE NITRURES. Bauxite and similar mixture is reduced in the electric furnace in presence of carbon, and further iron is added. The ferro-aluminium thus produced is finely divided, mixed with porous material, and exposed to the air, when the temperature spontaneously rises till it obtains a value sufficient for the combination of the aluminium with the nitrogen to form a nitride.

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: B.T.-H. Co. (*G.E. Co.*) [Distribution] 3,831/14 and [Conductors] 4,235/14.

DYNAMOS, MOTORS, and TRANSFORMERS: MASON [Generator] 174/14.

Heating and Cooking: BERRY [Heating apparatus] 3,722/14.

Ignition: HUMBER, LTD., and COLE [Magnets] 1,940/14.

Switchgear, Fuses, and Fittings: HORTON [Switches] 5,431/14; B.T.-H. Co. (*G.E. Co., U.S.A.*) [Cut-outs] 8,821/14; WILSON [Switches] 11,840/14; HENSELL [Fuses] 14,474/14.

Telephony and Telegraphy: GALLETI and MANGETTI [Discharges for producing oscillations] 2,739/14; SQUIER [Wireless telegraphy and telephony] 3,191/14; DE LANGE [Thermic telephone] 4,184 & 4,203/14; WESTERN ELECTRIC CO. (*Woodward for W.E. Co., U.S.A.*) [Automatic telephones] 4,489/14; LAMB [Antiseptic protectors for telephones] 15,598/14.

Traction: A.G., BROWN, BOVERI & CIE [Reversing and braking A.C. motors] 28,933/13; ASPINALL [Electric railway system] 901/14.

Miscellaneous: THORNTON [Illuminated signs] 3,953/14; SCOTT and MEDWAY [Electric Lifts] 4,236/14; SCOTT [Telemotors] 4,323/14; RAILING, PEACOCK and HUTCHINSON [Electrically worked presses] 4,735/14; CHAPMAN [Long-stroke electromagnets] 4,815/14; LUNDBERG, LUNDBERG, LUNDBERG and PEGG [Electric supply installations] 11,165/14; LINDSAY [Electric primers] 18,810/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Incandescent Lamps: JULIUS PINTSCH A.C. [Filament supports] 17,022/14.

Traction: Soc. ANON. DES ÉTABLISSEMENTS L. BLERIOT [Car lighting] 882/15.

Miscellaneous: GARLITZ [Magnetic skelp charging machine] 1,928/15; CLAUDE [Neon vacuum tubes] 2,020/15.

Amendment Made

3,655/13. Car Lighting and Engine Starting. C. F. KETTERING. This specification, which describes a combined lighting generator and engine-starting motor, has been amended by the addition of a reference to No. 18,444/12 of W. E. Lake (*J.B.M. ELECTRIC Co., NEW YORK*).

Application for Suspension

28,412/12. Sparking Plugs. G. RUPRECHT. An application by H. van Raden and W. G. Davis, trading as Davis & Walker, for the suspension of this patent, will be heard on March 11th. The specification describes a plug with the body made in two pieces, one of which is a nipple which screws into the other and forces a collar on the insulating sleeve against an internal shoulder on the nut forming the main body of the plug. The nipple forms the portion which screws into the cylinder.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:-

4,597/01. Maximum Demand Indicator. A. WRIGHT and REASON MANUFACTURING CO. Improvements in details of construction of the well-known Wright maximum demand indicator.

4,760/01. Temperature Compensation. A. CAMPBELL. A method of compensation of ammeters, voltmeters, &c., for temperature depending on the use of a Wheatstone bridge arrangement with arms of different temperature coefficients.

5,496/01. Meters: E. BATAULT. Numerous improvements in induction meters for A.C.

5,589/01. Telegraphy. A. MUIRHEAD. Details of a method of retransmission of messages received over submarine cables.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: J. S. HIGHFIELD [Wiring systems] 24,533/08.

DYNAMOS, MOTORS, and TRANSFORMERS: A. J. BOULT (*Felten & Guilleaume Lahmeyerwerke A.G.*) [Motor control] 27,026/09.

Electrochemistry and Electrometallurgy: A. H. HELFENSTEIN [Electric furnaces] 26,845/09.

Instruments and Meters: W. E. SUMPNER [A.C. instruments] 24,605/04.

Storage Batteries: E. W. JUNGNER [Construction of battery plates] 25,095/04.

Telephony and Telegraphy: A. G. BLOXAM [Tubular metal brackets for telegraph poles] 25,047/03.

Traction: B.T.-H. Co. (*G.E. Co., U.S.A.*) [Current collecting shoes] 25,863/06.

Miscellaneous: J. A. L. PEALING [Magnetic drill] 26,845/08; J. E. PRESTON [Primary batteries] 26,683/09.

American Submarines.—The American papers announce that the U.S. Navy is building a submarine equipped with Edison batteries. Orders have also been given to the Electric Boat Co. for a submarine of 1,000 tons displacement, which will have battery power enabling it to run under water for more than 24 hours. Its radius of action is to be 3,000 miles, its surface speed 20 knots, and its submerged speed 11 knots. Seven smaller coast defence submarines are also reported to be on order.

The German and Austrian Electrical Industry.—An article in the Vienna *Neue Freie Presse* of Feb. 12th, which we have received via Switzerland, states that the Austrian electrical manufacturing firms have "recently" taken up the manufacture of shells and other material for the army; electrical work is not very active. It is stated that the same applies to Germany. The Berlin Electricity Supply Company has been obliged to reduce its dividend by 4 per cent, but, on the other hand, the Vienna municipal electricity works had an increased output for the past year. The electricity works in places of medium and small size, and also some of the electric power works, however, are experiencing increased difficulty in obtaining fuel, and a law limiting the supply of both lubricating and fuel oil is also affecting them. Lamp manufacturers apparently are not finding it easy to get some of their raw materials, owing to an enactment with regard to the consumption and requisition of metals applying to tungsten, molybdenum, and thorium. Large schemes, such as the electrification of railways, and an extension of Vienna electric railway system have, needless to say, been postponed.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

At a meeting of the Students' Section of the Institution of Electrical Engineers last week, a series of discussions on the application of electrical engineering to warfare was commenced, with one on "communications" opened by Mr. P. R. Coursey, who pointed out how fire and flashlight signalling has long been superseded by electrical methods, which enabled great strides to be made towards the ideals of speed and secrecy. He referred to the uses of telegraphy in the Boer and Russo-Japanese wars, in the latter of which wireless telegraphy was first used in the field. In the present war, he said, five main types of electrical apparatus for communication purposes were being employed by the conflicting armies: wireless telegraph; Wheatstone automatic telegraph; Morse sounder; vibrator tele-

graph, and field telephone; the last two being sometimes combined into one apparatus. Mr. Coursey gave brief descriptions and illustrations of the most general types of military apparatus, and compared their uses and relative advantages. Mr. Smith Rose referred to the difficulties of reception of wireless messages on aeroplanes on account of the noise of the engine. Mr. Emtage suggested that it might be possible to detect the approach of Zeppelins and submarines by picking up their ignition sparks by wireless receivers; and described the pneumatic headpiece "shock-absorbers" worn by airmen, which, at the same time served to deaden the noises due to the engine, and facilitated wireless reception. A number of questions were asked, and the chairman (Mr. Duddell) contrasted the modern means of communication with those employed in wars 100 years ago and more, and the great objection, he said, to modern methods of communication is that they all give too much information to the enemy, and in many cases despatch riders were proving to be a more secret means of communicating intelligence. A note on a further section of the discussion on a different branch of the subject will be found on another page.

"ELECTRICAL ENGINEERING" TRADE SECTION

ELECTRICAL TRADE WITH CANADA

Special Interview with H.M. Trade Commissioner

MR. HAMILTON WICKES, H.M. Trade Commissioner for Canada, is in London for about a fortnight, and kindly granted our representative an interview. We were naturally anxious to learn Mr. Wickes's opinion as to the position and prospects of the electrical engineering industry in the Dominion, and he gave us some very interesting information with regard to this and as to the methods employed by our most successful competitors there. The competition for the Canadian electrical trade is with the United States, not with Germany—strange to say, although the effect of the war was mentioned in our conversation (as will be seen later in this article), the name Germany did not pass Mr. Wickes's lips during the long half-hour we spent with him.

The bulk of Canada's electrical requirements is at present probably supplied by the Canadian General Electric Co., which works in close connection with the American General Electric Co., and by the American Westinghouse Co. Both have works in Canada, and, in fact, the Canadian General Electric Co. is now entirely Canadian-owned; it works, however, in close connection with the General Electric Co. of Schenectady, and its methods are "ultra-American."

It is essential for any firms who desire to open up good business in Canada to make a thorough study of the requirements there; it is not merely sufficient to send over a representative who does not know the country, and to offer plant and apparatus of standard English patterns, relying merely on the reputation of the firm and the quality and price of the goods being "right." Canada, it must be remembered, has been largely educated up to American standard designs and patterns. Low price is not so important as to supply exactly what is wanted, and comparatively trifling departures from what is required may lose repeat orders.

The successful salesmen of the Canadian and American electrical firms are largely drawn from the McGill University and other colleges. In the case of one firm, for instance, only graduates from such recognised colleges will be taken, and they are started at once with a salary of £70 to £100 a year to take a practical course at the company's works, where they also attend lectures. After that they are placed for a year in the district correspondence department at the head office, and are then sent out as correspondents in a district office, and gradually get in touch with customers. When they finally start life as salesmen, they know the details of the business thoroughly, have the enthusiasm of youth, and are thoroughly imbued with the idea that their's is the best, in fact, "the only" concern in the world. Firms at home, Mr. Wickes told us, appear to expect that, unless a large amount of business is obtained at once, it is no good proceeding further, whereas as much will depend on the personality and intelligence of their representative as upon

the firm itself, and it is necessary to choose the right man, to place full confidence in him, and to give him responsibility and time to develop business gradually. He must be capable, not only of getting orders, but of arranging all details, of giving instructions to headquarters, and not merely receiving them, and of carrying out contracts to final completion.

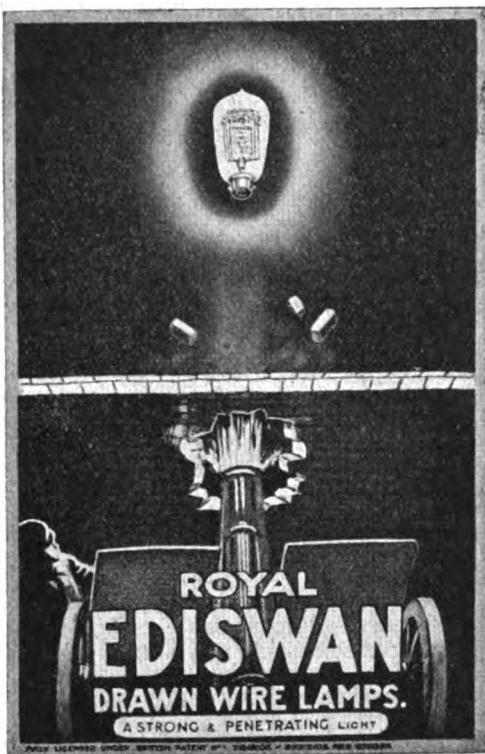

The "Underwriters' Laboratory" has been one of the difficulties in the way of placing English apparatus for house installation work on the Canadian market. The insurance companies in Canada have made joint cause with the American companies, and have agreed to accept only the standards approved and tested by the American Underwriters' Laboratories—of Chicago—and in conformity with the specifications of the American "National Electric Code." Last year, however, arrangements were made by which Messrs, Heap & Digby represent the Laboratories in London, and their examination of apparatus is accepted (see ELECTRICAL ENGINEERING of July 23rd, 1914, p. 417). It may be mentioned incidentally that it is not only wire, cable, and smaller accessories that come under the National Electric Code, but also generating and transforming plant, &c., if it is to be installed in houses.

The British fire insurance companies have, in this direction, missed a great opportunity for benefiting British trade. A very large proportion of the buildings in Canada are insured with British companies, and if they had insisted on British rules and standards instead of American, the position there would be very different. We wonder whether it is still not too late for the matter to be taken up in this light by the British Electrical and Allied Manufacturers Association.

Needless to say, before parting with Mr. Wickes, it was necessary to ask him the all-important question: What effect are the war conditions having upon electrical trade in Canada? Mr. Wickes's answer was unexpected. The war conditions are bringing money into Canada, and as a result a healthy permanent increase in trade may be confidently expected. Canada has received orders from Great Britain to the value of fifteen or sixteen million pounds sterling. We will not particularise as to the industries in which these orders are placed, but will merely point to the obvious result that the Dominion will be the richer for them. The result is that over 40 per cent. more ground is being cultivated in the prairie provinces, and given a fair crop, and the good prices which must prevail, an enormous amount of money will be flowing into Canada. Canada will be richer, and every industry, including the electrical industry, will receive considerable stimulus, as there will be money to spend. Mr. Wickes does not anticipate that the trade boom in Canada will be quite equal to that in 1911 and 1912—which, however, was followed by a serious reaction for eighteen months, owing to over-speculation in "real estate." But the English firms then mostly only came in towards the end of the prosperous period, and thus also experienced an undue share of the results of the reaction. This time they have an opportunity of taking the tide at the flood, and we will hope that it will "lead on to fortune."

AN EFFECTIVE LAMP ADVERTISEMENT

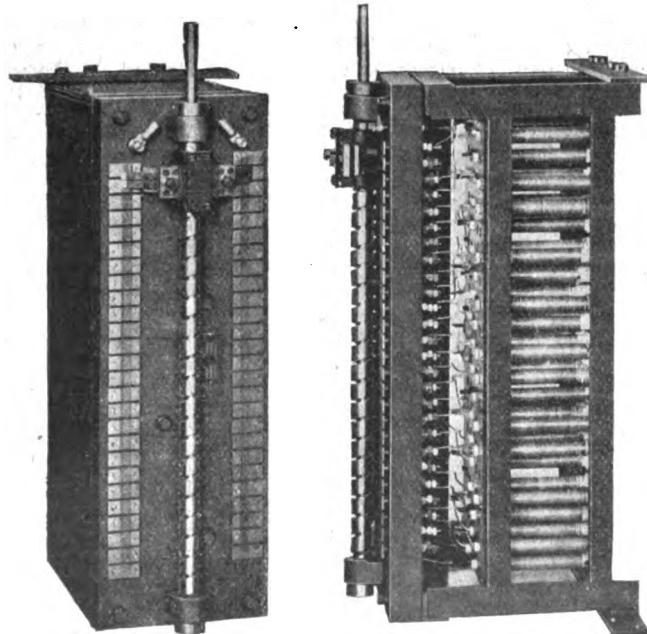

WE reproduce here the striking new poster design which appears on the cover of a neat little folding price-card of Royal Ediswan lamps and also figures on an order form

postcard which is being issued by the Edison & Swan United Electric Light Co. (Ponders End, Middlesex). These cards can be overprinted with contractors' names and addresses. The way in which the idea of a "strong and penetrating" light is expressed is very appropriate.

EXCITER FIELD REGULATORS

A PATTERN of exciter field rheostat of the rectangular type, somewhat similar to the main alternator field regulators described in ELECTRICAL ENGINEERING, Nov. 19th, p. 604, has been brought out by the General Electric Co.,

EXCITER FIELD REGULATOR FOR 3,000-kw. TURBO-ALTERNATOR.

Ltd. (67 Queen Victoria Street, E.C.). This regulator, which is shown in the accompanying illustrations, consists of two parallel lines of rectangular contacts mounted on a slate

base. The base is carried on a strong steel framework, on which is also mounted the resistance, composed of special resistance wire wound on asbestos tubes. These asbestos tubes are carried on steel supporting bars, which are bolted at both ends to the framework. The connections between the resistance wire and the contacts are solid, there being no loose wires. This follows on standard G.E.C. practice for all their regulators and starters. The regulator illustrated was one of a number constructed for controlling the shunt current of the exciter for a 3,000-kw. turbo-alternator.

A CHARGING APPARATUS FOR SMALL CELLS

A SIMPLE and convenient charging device for portable lamp cells has been put on the market by L. E. Wilson & Co. (10 Corporation Street, Manchester) for use in connection with the cells for their "Thomson" pocket accumulator lamp. This consists of a patent porcelain holder which can be screwed on the wall, preferably adjacent to a suitable switch, which should be replaced by a special duplex switch. This is arranged to turn on a lamp in the ordinary way, or connect the charging apparatus to the circuit with the lamp as a resistance in series. Thus the apparatus in no way interferes with the existing installation, but is always ready for use, and when once the poles are correctly defined and connected up, no chances of a reversal in polarity are possible. The introduction of a cell for re-charging purposes makes very little difference to the light. By this means the process of re-charging the Thomson electric accumulator is quite simple and easy, it being only necessary to add some distilled water and slip the cell into the holder. A number of these holders can be connected up in series, and whether a cell is inserted or removed the circuit is still maintained, and, therefore, either one or several cells can be re-charged simultaneously.

HOLDER FOR SMALL CELLS DURING CHARGING.

CATALOGUES, PAMPHLETS, &c., RECEIVED

SMALL DYNAMOS AND MOTORS.—In ELECTRICAL ENGINEERING, Feb. 4th (p. 52) we described a new line of continuous-current motors which have been introduced by the British Thomson-Houston Co., Ltd. (Rugby). We have now received from the company a complete price list of these motors, together with a descriptive pamphlet relating to machines of similar design wound as generators.

BRAKE MAGNETS.—Another new B.T.H. list gives full particulars of a series of sizes of alternating-current brake magnets of the direct pull type.

LIGHTNING ARRESTERS.—Lightning arresters of the multigap type with grade shunt resistance are described in a further pamphlet from the British Thomson-Houston Co. These are standardised for voltages up to 37,000 volts. Choke coils, and other accessories for use in connection with this form of lighting and surge protection, are also included. The chief feature of this arrester is that it provides selective circuits whereby a discharge of any frequency finds an easy low impedance path to earth. One path with high shunt resistance and a small number of series gaps is for discharges of low frequency or for discharging the gradual accumulation of static electricity. A second path with low shunt resistance and a larger number of series gaps will carry heavier discharges and those of medium frequency. A third path with gaps only is for discharges of extremely high frequency.

VACUUM CLEANERS.—An attractive folder from the Electric Suction Cleaner Co. (56 Victoria Street, S.W.), embellished with a portrait of a satisfied user, calls attention to the advantages of the Frant Premier Suction Cleaner from a domestic point of view.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Barking.—The Borough Electrical Engineer has prepared a report upon extensions to the plant and mains.

Batley.—A loan of £6,500 for electrical extensions has been sanctioned by the L.G.B.

Darlington.—A loan of £13,000 is to be applied for to meet expenditure on mains, services, and transformers during the next three years.

Heywood.—A L.G.B. inquiry concerning a loan of £12,460 for electrical extensions has been held. (We refer to this inquiry in an article dealing with the Treasury restrictions as to borrowing.)

Hove.—A 500 kw. mixed pressure turbo-generator and surface condensing plant is required; also a 600 ampere-hour battery. Borough Electrical Engineer. March 26th.

Kingston-on-Thames.—The Borough Electrical Engineer recommends sanction to a loan of £11,000 for mains, services, meters, &c., during the next four years.

London: Hackney.—As certain difficulties have arisen regarding the proposed loan of £10,000 from the L.C.C. for electrical extensions, arrangements have been made with the London City and Midland Bank for a loan. The Electricity Committee has been in communication with the Treasury, and has been informed that their consent is not needed to this borrowing. The loan is at 4½ per cent.

Wednesbury.—A loan of £1,086 for giving a supply in the King's Hill district has been sanctioned.

Miscellaneous

Cardiff.—Twelve months' supply of electrical stores. Town Clerk. March 18th.

Carlisle.—Six months' supply of general stores for the Electricity Department. Borough Electrical Engineer. March 31st.

Chichester.—Twelve months' supply of electric lighting sundries for West Sussex County Asylum. Clerk, March 23rd.

Doncaster.—An expenditure of £5,800 is contemplated upon tramcars.

Liverpool.—Six months' supply of electrical stores for the West Derby Union. Clerk, Brougham Terrace. March 16th.—The Toxteth Park Guardians also require similar supplies for three months. Clerk, 15 High Park Street. March 25th.

London: Wandsworth.—One month's supply of electrical fittings for the Union. Clerk, St. John's Hill. March 15th.

Merthyr Tydfil.—Six months' supply of electrical stores for the Guardians. Clerk, 184 High Street. March 16th.

Richmond (Surrey).—Twelve months' supply of electric lighting and telephone fittings for hospital. Clerk, Mogden Isolation Hospital, Isleworth. March 15th.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Cardiff.—The tender of Messrs. H. J. Cash & Co., of London, at £2,400, has been accepted for the electric wiring of the new technical institute.

Eastbourne.—The Electricity Committee recommends the purchase from the Brush Electrical Engineering Co. of a 1,250 kw. Ljungstrom turbo-alternator at £5,300. In presenting the report, the Chairman of the Electricity Committee paid a compliment to Mr. J. K. Brydges, the Borough Electrical Engineer, who, he said, during the twenty years he had been with the Council, had never led the Committee astray in any of his recommendations.

London: Hackney.—The tender of Messrs. John Spencer, Ltd., at £1,060 for pipework and valves in connection with a 5,000 kw. turbo-alternator, is recommended for acceptance.

Maidstone.—The Corporation has accepted the tender of the Brush Electrical Engineering Co. for a 1,250 kw. Ljungstrom turbo-alternator at £6,887.

West Ham.—A contract has been placed with Venner & Co. for a twelve months' supply of Chamberlain and Hookham A.C. meters.

Winchester.—A contract has been placed with Venner & Co. for a twelve months' supply of Chamberlain and Hookham's D.C. meters.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Canada.—Mr. Wickes, H.M. Trade Commissioner for Canada, an interview with whom appears on p. 109, is now at the Commercial Intelligence Department of the Board of Trade every day, and will be only too pleased to give information and advice to manufacturers as to the appointment of agents, methods of marketing and distribution, terms of payment, names of probable buyers of British goods, statistics of imports, and rates of Customs duties, in Canada. In order that appointments may be satisfactorily arranged, firms who may desire to have an interview with Mr. Wickes are requested to make their applications as soon as possible. Such applications should be addressed to the Director, Commercial Intelligence Branch of the Board of Trade, 73 Basinghall Street, London, E.C.

Mr. Wickes expects to be in London for not more than a fortnight, after which he will visit such trade and industrial centres in the provinces as it may appear most advantageous to visit in view of applications that may be received from firms in or near those centres, and from Chambers of Commerce.

Price of Copper.—Although the metal exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £69 10s. to £70 (last week, £69 5s. to £69 15s.).

Changes of Address.—The London & Rugby Engineering Co., Ltd., have removed to 36 & 37 Queen Street, E.C., which is also now the London address of the Rugby Lamp Co., Ltd., and Jas. Procter, Ltd. (telephone, City 5252; telegrams, Cleodora, Cannon, London).—The Dussek Bitumen Co. have moved their headquarters to their additional works at Empress Wharf, Bromley-by-Bow, E. Certain of their products will still be manufactured at Deptford, but all correspondence should be sent to the above address. (Telephone, East 4127).—Pitter's Ventilating and Engineering Co., Ltd., have removed their offices to their works at 33 Nightingale Vale, Woolwich, S.E. (Telephone, Woolwich 427.)

Russian Agency.—An agent at Grosny desires to represent United Kingdom manufacturers of electric lamps and accessories. Further particulars at 73 Basinghall Street, E.C.

Bankruptcy.—G. J. Parfitt, Consulting Electrical Engineer, 11 Priory Road, Keynsham, has been adjudicated a bankrupt. The first meeting of creditors took place yesterday, and the public examination will be held at the Guildhall, Bristol, on April 16th, at 12 noon.

Lundberg's Switching Competition.—“W.E.S.” referring to the results of this competition published in ELECTRICAL ENGINEERING, writes that one outstanding feature, however, which illustrates how the art of switching is coming to the fore, not merely as a novelty but as a means of efficiently controlling various electrical apparatus, in that the various Polytechnics are giving greater attention to the subject. The recent list contains the names of no fewer than 17 students of the South-Western Polytechnic who have succeeded in gaining between them, one cash prize, five book prizes, and 17 certificates. East Ham Technical College students obtained one book prize and three certificates.

Ozonair Generators.—The Edison Swan United Electric Light Co., Ltd., have an excellent window display of “Ozonair” generators at their showroom at 123-125 Queen Victoria Street this week, and have also a large range of these in the showroom itself. The uses of this apparatus for the purification of air in rooms and offices, and for the destruction of smells in kitchens, lavatories, &c., are probably well known to most of our readers, but many may not have seen the actual apparatus, and should take the opportunity of inspecting it at the Ediswan showrooms.

APPOINTMENTS AND PERSONAL NOTES

Mr. A. P. Trotter asks us to state that his official address is 8 Richmond Terrace, Whitehall, London, S.W., and not the one printed in the List of Members of the Institution of Electrical Engineers.

Mr. A. W. Lunn, of Sunderland, has been appointed Shift Engineer at the Stuart Street Station, Manchester, at a commencing salary of £175 rising to £200.

The salary of Mr. S. H. Penning, Deputy Borough Electrical Engineer at Woolwich, is to be increased by two increments of £15 to a maximum of £250.

Mr. Reginald P. Wilson is now on his way back to London after an extended visit to South America.

A Colliery Engineer is required for China.

LOCAL NOTES

Kingstown.—*Arbitration Award.*—The award in the recent arbitration to determine the price which the Council should pay the Dublin Southern District Electric Supply Co. for their Kingstown Electric Lighting Order, is £3,068. This is regarded as a high figure, and there is a general feeling that the Council has been badly hit over the transaction. It may be recalled, however, that the obtaining of the Order in question has involved costly negotiations extending over two or three years, and the point as to whether the Council should pay these, or some proportion of them, was the main argument before the arbitrator.

Leyton.—“Linking-Up.”—The question of the possible linking-up of the Council's electricity undertaking with Hackney has been referred to the Lighting Sub-Committee for consideration.

London.—*St. Marylebone.*—*Inclusive Tariff for Heating and Cooking.*—Mr. A. H. Seabrook, the Borough Electrical Engineer, has devised a tariff for heating and cooking on the basis of an annual charge, plus ½d. per unit, to include charge for hire of apparatus. Hitherto the tariff has been an annual charge, plus ½d. per unit, for current together with rentals for the apparatus.

Islington.—*Councillor “Arrested.”*—An amusing incident at the electricity works is reported in our contemporary, the *Islington Gazette*. It appears that Councillor Clarke called at the electricity works to see Mr. Gay, the Borough Electrical Engineer, who was, however, not on the premises. Subsequently he was inspecting the coal stocks, when he was observed by two sentries, “arrested” and escorted off the works. From the interview which he gave to our contemporary, Councillor Clarke seems to be greatly concerned at the indignity to which he feels he has been put, but the central fact which emerges from the incident is not one of sympathy for the Councillor, but one of satisfaction at the adequacy of the steps taken to protect the works.

Yorkshire.—*Opposition to Power Bill.*—A Joint Committee of representatives of West Riding County Boroughs has been appointed to watch the progress of the Yorkshire Electric Company's Power Bill. The Chairman of the Bradford Corporation Electricity Committee and the Town Clerk have been nominated to represent Bradford. There are signs, however, that a considerable portion of the opposition will be met.

COMPANIES' DIVIDENDS, REPORTS,
MEETINGS, &c.

W. T. Henley's Telegraph Works Co.—A final dividend, making 15 per cent. for the year, with a bonus of 5s. per share less tax, is declared for 1914, as for the previous year.

City of London Electric Lighting Co.—A final dividend, making 9 per cent. on the ordinary shares for 1914, is announced, compared with 10 per cent. last year. £50,000 has been placed to reserve.

Newcastle-on-Tyne Electric Supply Co.—A final dividend, making 5½ per cent. for 1914, the same as in the previous year, is recommended. The depreciation account is credited with £20,000.

British Insulated & Helsby Cables.—Owing, it is stated, to large Government and railway contracts last year, the dividend for 1914 is 15 per cent., compared with 13 per cent. in 1913. The sum of £88,500 is carried to reserve, and £119,000 carried forward.

Charing Cross, West End & City Electricity Supply Co.—Reference was made at the annual meeting last week to the position regarding electric supply in London. Mr. F. W. Fladgate, the chairman, said that the directors had always held the view that a gradual change was the only economical and wise course, and they were quite willing, on fair terms, to co-operate. Although the L.C.C. Bill had been abandoned for the session, the directors were quite willing, provided they were fairly met, to advise the sale of their undertaking to the L.C.C. It must be understood, however, that the Company expect to be treated generously, and that the price to be paid must be very different from that provided under the Electric Lighting Acts. At the same time it was far from being admitted that London is badly served in the matter of electric supply.

Metropolitan Electric Supply Co.—A final dividend, making 3½ per cent. for 1914, is recommended, compared with 4½ per cent. in the previous year. The depreciation and reserve fund has been credited with £22,000, and the balance of £38,795 is carried forward. The gross revenue is about £2,000 less than in the previous year, all of which loss was incurred during the last half, due to war conditions.

South Metropolitan Electric Light & Power Co.—At the annual meeting last week, Mr. H. W. Bowden, the Company's Engineer, stated that notwithstanding the abnormal conditions last year, the costs of generation were again the lowest on record for the Company. The new turbine plant has been largely responsible for this, another factor being the use of coke breeze as fuel obtained from the gas works adjoining the Company's power station. The results obtained with a test boiler using this fuel have proved eminently satisfactory. This is believed to be the first installation of its kind in an electric power station in this country.

Waste Heat & Gas Electrical Generating Stations.—The directors report that no new generating stations have been erected during 1914, but negotiations are taking place for additional plant to be installed at the Weardale and Grangetown power stations.

British Westinghouse Co.—A dividend of 7½ per cent. is declared on the preference shares for 1914.

Arrangements for the Week.—(To-day) Thursday, March 11th.—Institution of Electrical Engineers. “Electric Cooking Mainly from the Consumer's Point of View,” by W. R. Cooper. 8 p.m.

Friday, March 12th.—South-Western Polytechnic, Chelsea. Prize distribution. 8 p.m.

Physical Society, Imperial Institute, S. Kensington. (1) “The Unit of Candle Power in White Light,” by C. C. Paterson and B. P. Dudding. (2) “The Relative Losses in Dielectrics in Equivalent Electric Fields, Steady and Alternating (R.M.S.),” by G. L. Addenbrooke. 8 p.m.

Saturday, March 13th.—Birmingham and District Electric Club, Swan Hotel. “Electric Vehicles,” by W. E. Warrilow. 7.30 p.m.

Monday, March 15th.—Institution of Post Office Electrical Engineers, at I.E.E., Victoria Embankment. “Telephone Engineering Economics,” by H. A. Smith. 6 p.m.

Tuesday, March 16th.—Illuminating Engineering Society. At Royal Society of Arts. Discussion: “The Marking and Rating of Lamps and the best Methods of Specifying, their Illuminating Value.” 8 p.m.

Wednesday, March 17th.—Institution of Electrical Engineers, Birmingham Section. Mr. W. R. Cooper's paper on “Electric Cooking” will be read. 7.30 p.m.

Institution of Electrical Engineers, Students' Section, Victoria Embankment. “Some Experiments on the Induction Generator,” by W. H. Date. 7.45 p.m.

SUMMARY

A LARGE electric cooking installation capable of providing a *table d'hôte* dinner for 500 persons has been inaugurated at the Bradford Kursaal (p. 114).

WORK has been commenced on the site of the new generating station of the Glasgow Corporation at Dalmarnock, which is ultimately to have a capacity of about 140,000 kw. (p. 115).

JUDGMENT has been given against the Robin Electric Lamp Co., Ltd., on their application for a compulsory licence under certain patents relating to drawn tungsten wire held by the B.T.-H. Co. and Siemens Bros. Dynamo Works, Ltd. Mr. Justice Warrington held that the patentees had fully met the needs of the public and that no new industry has been prejudiced by the conditions which they sought to impose upon the Robin Co. (p. 115).

A PAPER dealing with electric cooking from the consumer's point of view, by Mr. W. R. Cooper, was read at the Yorkshire Local Section of the Institution of Electrical Engineers last week, and was discussed at the London meeting of the Institution last Thursday. The paper was somewhat severely criticised in the discussion in London, for it was generally felt that the results obtained were those of an isolated experiment, the conditions attaching to which were by no means normal. The cost of the apparatus was regarded as extremely high, and the necessity of hiring cookers was emphasised. Mr. Seabrook mentioned that Messrs. Selfridge are now putting down the largest electric cooking outfit in the world, which will be capable of cooking for the whole of their staff (p. 116).

A SUB-COMMITTEE of the Engineers' Club, Manchester, has issued a report urging the formation of an Association of British Engineering Manufacturers, to take in hand the organisation of the engineering industry and fit us to the utmost for competition with Germany in the future (p. 118).

DR. L. DE FOREST has devised a new detector for continuous waves (p. 118).

STORAGE battery omnibuses are to be run in New York in competition with tramways (p. 118).

THE calculation of the whirling speed of a steel shaft is dealt with in our "Questions and Answers" columns (p. 119).

SPECIFICATIONS dealing with the Squier "wired wireless" telegraph system, cooking apparatus, lamp leading-in wires, and avoidance of interference with telephones by A.C. railway circuits were published by the Patent Office last Thursday. Application has been made to suspend several enemy-owned patents relating to the manufacture of aluminium coils with aluminium oxide insulation. A Patent has been granted to W. Aitken for a semi-automatic telephone system in spite of opposition, and to the B.T.-H. Co. for a system of winding motor control by liquid rheostats. A meter patent of A. C. Heap and W. O. Smith expires this week after a full life (p. 120).

A NUMBER of reflectors for incandescent lamps are illustrated in our Trade Section, which also describes an electric turret clock, lamp standards of insulating material, and an ironclad switch (pp. 121 and 122).

A 650 kw. rotary-converter and static transformer are required at Manchester; a £10,000 scheme of extensions at Leigh has been referred back; a loan of £6,500 has been sanctioned at Batley; the Deal & Walmer Gas & Electricity Co. has received Treasury sanction to issue new capital for electrical purposes; a 150-ton electric crane is required at Sydney (Australia); and a £35,000 extension scheme is proposed at Colwyn Bay (p. 123).

SOME discussion is taking place in Manchester in consequence of the possibility of the Treasury capital restrictions holding up the construction of the new Barton power station. Disappointment has also been expressed at Bury in this connection.—The charge for current is to be increased at Pembroke (Ireland).—The rateable value system of charging is to be adopted at Loughborough (p. 124).

THE dividend on the ordinary shares of the British Electric Transformer Co. is 2½ per cent. less than in 1913.—The Brompton & Kensington Electricity Supply Co. has declared 10 per cent., as in 1913 (p. 124).

THE Doncaster and Dewsbury Corporations have obtained wiring powers, but the work is to be carried out through a contractor (p. 124).

(For Arrangements for the Week see p. 115.)

ELECTRIC COOKING AT BRADFORD

A LARGE electric cooking installation has been carried out at the Bradford Kursaal capable of providing a *table d'hôte* dinner for 500 persons, and a large company assembled on Tuesday of last week at

only pressure of business and shortage of plant that prevented the establishment of a hiring scheme for electric cookers. The extension to the Valley Road plant, at a cost of £90,000, was now well advanced towards completion. Some new plant was in commission; it was hoped the new battery would be put in during the next few weeks, and that the new turbine would be running in the early summer. A record profit of £15,000 was

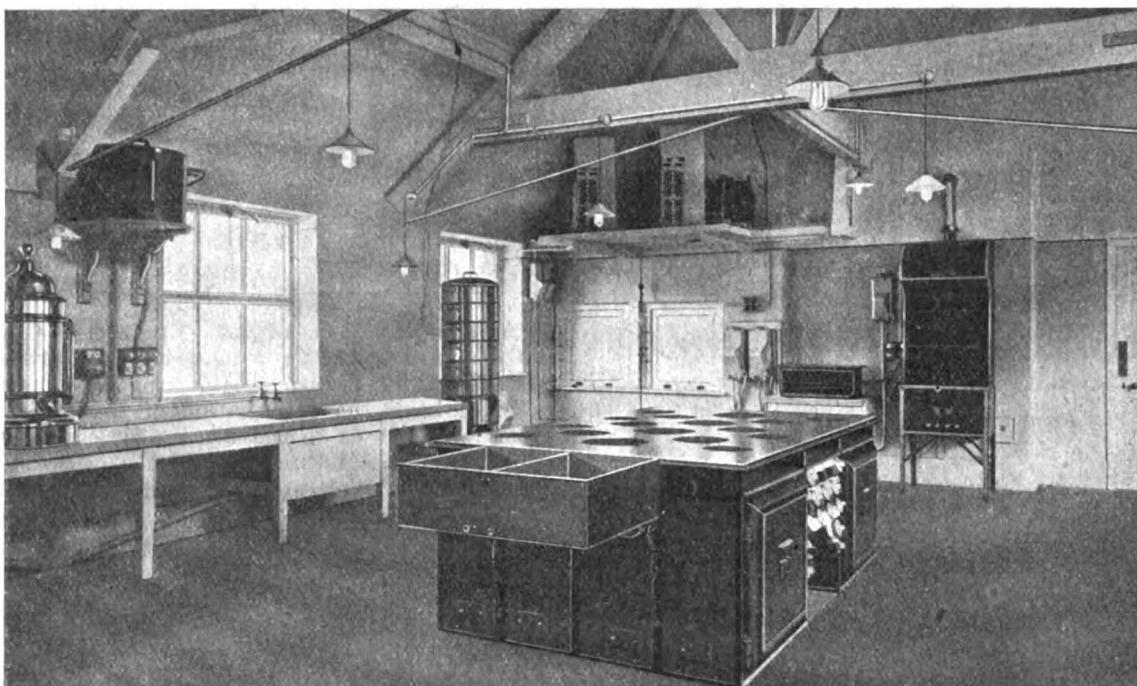

FIG. 1.—MAIN KITCHEN.

the invitation of the chairman (Cr. J. Haley) and members of the Electricity Committee of the City Council to inspect the installation and to partake of an excellent dinner in the Queen's Hall, which was cooked entirely electrically. The installation was supplied to the order of the Bradford Baths Committee,

made by the Department last year, but probably the profit for the current year would not reach that mark. Mr. Roles, who proposed "The Contractors," said that electric cooking was no new thing, and remarked, incidentally, that the only means of cooking a hot meal on a submarine was by means of electricity.

Views of the kitchen and the servery showing a quantity of the apparatus are given in our illustrations. The main central range (which is fitted with a bain marie) is over 9 ft.

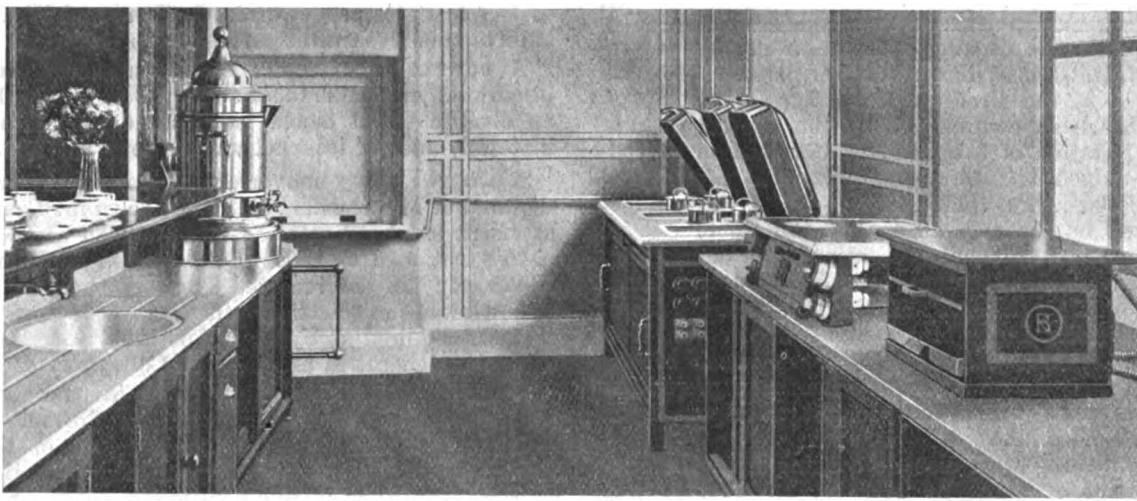

FIG. 2.—SERVERY OF CAFÉ.

and is largely due to the initiative of the chairman, Ald. H. M. Trotter.

After dinner, the Lord Mayor of Bradford (Ald. G. H. Robinson) proposed the toast of "The Kursaal and its electrical cooking installation," to which Ald. Trotter responded, expressing the belief that the time would come when electric cooking would be in extensive domestic use. The rapid advance in the Bradford electricity undertaking was referred to by Mr. S. Neumann, who, in proposing "The Department," said that in the last 20 years the consumption had increased more than fiftyfold. Cr. J. Haley replied that its success was largely due to Mr. T. Roles, the City Electrical Engineer, and it was

long. It is fitted with four ovens taking 4 kw. each, each about 2 ft. cube, and the frame is of cast-iron stove enamelled black with ground bright facings and bright boiling table. This boiling table is fitted with four 12-in., five 10-in., and eight 8-in. boiling rings, taking 2, 1'5, and 1'2 kw. respectively. The ovens and boiling rings are arranged for three degrees of heat regulation. The switches and fuses are mounted in conspicuous and easily accessible positions, and each oven and boiling ring has an indicator lamp to show when the current is on. The bain marie (2 ft. 8 in. by 1 ft. 9 in. by 6 in. deep) is divided into two compartments separately controlled by switches and fuses. Its maximum consumption is

3 kw. A circular steamer tinned inside and nickel-plated outside, 19-in. diameter, with six 6-in. deep steaming compartments fitted internally with steam channels and draining holes, is also provided. The steamer is controlled by three heaters of an aggregate capacity of 4·5 kw., which may be used singly or collectively. Another piece of apparatus is a fish or potato frier of blue planished steel with bright mouldings, and having a compartment 2 ft. by 18 in. of ample depth. This is fitted with two 2-kw. heaters, and is controlled by four switches for easily controlling the temperature of the fat in which the frying takes place. The grill has a grilling area of 24 in. by 12 in., and is made of cast-iron, and fitted with grill guard, grilling grid, and drip tin. It is rated at 4·5 kw. maximum.

One 10-gallon 4·5-kw. nickel-plated copper hot-water urn is provided for drinking purposes, and a 10-gallon copper cylinder mounted on the wall, fitted with ball cock and water gauge, is used for providing hot water for washing-up purposes, pipes being connected to sinks for this purpose. This is rated up to 6 kw. maximum.

In the ground-floor café there is one carving table and hot cupboard measuring 6 ft. 6 in. by 2 ft. 6 in. by 2 ft. 9 in. mounted on castors, fitted with three tinned copper carving dishes 19 in. by 14 in., with hinged covers, and four 7-in. nickel-plated gravy- and sauce-pots. The hot cupboard underneath has an internal dimension of 5 ft. 9 in. by 2 ft. 1 in. by 2 ft. high. There are three regulations of heat provided with this apparatus, which works up to 3·5 kw. Other apparatus comprises a 5-gallon double-lined nickel-plated 2·5-kw. coffee or milk urn, a 10-gallon 3·5-kw. hot-water urn for drinking purposes, a 2·5-kw. toaster with a working surface of 17 in. by 11 in., a breakfast cooker containing two 8-in. boiling rings, one 6-in. boiling ring, and one 11 in. by 8½ in. grill.

A 4-kw. electric hot-water geyser is also fitted in the counter for providing hot water for washing-up purposes to two wash bowls.

The middle café is fitted with one 2·5-kw. toaster, one 3·5-kw. hot-water urn for providing water for drinking purposes, one 2·5-kw. coffee or milk urn, and an electric 4·0-kw. geyser fitted to the wash bowls. Electrically-heated 150-watt towel rails are provided in each of the cafés.

The above plant, with the exception of the geysers and towel rails, has been supplied by The Brompton & Kensington Accessories Co., Ltd. (London), to whom we are indebted for the above particulars; the geysers and towel rails were supplied by the British Electric Heater Co. of Glasgow.

THE NEW GLASGOW GENERATING STATION

THE Electricity Committee of the Corporation of Glasgow paid a visit last week to the site of the large new electricity works which is under construction at Dalmarnock Bridge. This site, adjoining the Dalmarnock Road, was purchased in November, 1911, and originally consisted of 33,677 sq. yds., but a subsequent purchase from the Caledonian Ry. Co. raised the total area to 64,809 sq. yds (13½ acres). The total cost of the site was £27,112, or 8s. per sq. yd. An ample supply of condensing water is obtainable direct from the Clyde, and railway sidings are already laid on the site. The first portion of the works, which is now under construction, consists of a water intake, a screening house, two water culverts (one for the inlet water and one for the outlet water), switch house, turbine room (75 ft. by 240 ft.), two boiler houses, each 150 ft. by 84 ft., workshop and store, and a complete coal-handling plant capable of dealing with 100 tons of coal per hour. Contracts were placed for the excavation of the ground in April, 1914, and subsequently in August for the water channels and concrete foundations. These contracts amount to a total of £48,000. The contract for the coal-handling plant has also been placed, and the cost of this portion of the work amounts to £24,800. Offers will shortly be asked for the first portion of the buildings, and specifications for the first instalment of plant are practically ready. This plant will consist of two 10,000-kw. and one 15,000-kw. turbo-alternators. There will also be three 1,000-kw. turbo sets for driving auxiliary machinery, and all the necessary condensing plant and circulating pumps. It is proposed to continue installing plant units of 15,000 kw. as the demand increases, but units of 30,000 kw. can be installed if found desirable. The ultimate capacity of the Dalmarnock works will be at least 140,000 kw. It is intended to transmit electricity from the works at a pressure of 20,000 volts (three-phase alternating, 25 periods per second) to existing distributing centres at Port Dundas,

St. Andrew's Cross, Govan, and Partick. There the energy will be transformed from 20,000 to 6,500 volts, and distributed at this pressure to existing sub-stations, where again it will be transformed to low-pressure current for the general supply throughout the city. A considerable length of new cable ducts will require to be laid, and it is hoped that the first part of the Dalmarnock works will be ready to deliver energy at the beginning of the winter of 1916-17. With reference to the growth of the load on the Glasgow system, it is interesting to note that at the end of 1914 the total demand applied for was just short of 90,000 kw., a figure which has more than doubled itself since 1907. The maximum plant in the station is about 55,000 kw., also about double that in 1907, and the maximum load about 39,000 kw.

DRAWN TUNGSTEN LAMP FILAMENTS Compulsory Licence Refused

M R. JUSTICE WARRINGTON on Friday gave judgment in the action in which the Robin Electric Lamp Co., Ltd., applied for a compulsory licence to manufacture drawn tungsten wire under nine patents held by the British Thomson-Houston Co., Ltd., and Messrs. Siemens Bros. Dynamo Works, Ltd. We reported the hearing of the case in our issues of March 4th and 11th, pp. 90 and 105.

After drawing attention to the fact that this was the first application of the kind under Sections 24 and 27 of the Patents Act of 1907, Mr. Justice Warrington said a good deal turned on the precise meaning of the wording of these sections. He held, however, that an applicant for a compulsory licence must prove that the patentees had not met the reasonable requirements of the public as distinct from those of a particular individual. Mere default on the part of the patentee to supply the patented article or to grant licences in particular cases would not bring the patentee within the sections in question, as a sufficient number of licences might already have been granted. It must also be proved by an applicant that an existing trade or industry as a whole was affected by the action of the patentee, or that a new industry was prejudiced. It was true that the effect of the policy of the Tungsten Lamp Association was that the price of drawn-wire electric lamps in this country was considerably higher than abroad, but there was no evidence that it was so high as to be a serious burden on the consumer or to be unreasonable; the supply of lamps was adequate to meet the demands of the public. The actual petition in this instance was concerned with the supply of drawn tungsten wire. A supply of wire had been offered on terms which would add 10d. to the cost of the lamp which the Robin Co. desired to make. It had been established on the petitioner's own evidence that there was no industry in which tungsten wire was used except lamps, and he was of opinion that the needs of the public are amply satisfied in respect of lamps. The manufacture of a new form of lamp by the petitioners would not establish a new trade. The Robin Co. would simply be a new trader in an existing industry, and there was no evidence that the existing industry had been in any way prejudiced by any Act or condition of the patentees.

The petition was therefore dismissed with costs.

ELECTRIC COOKING

IN a Paper read on Wednesday of last week before the Yorkshire Local Section of the Institution of Electrical Engineers, and discussed in London last Thursday, Mr. W. R. Cooper took up the subject of electric cooking mainly from the consumer's point of view. He gave some results of experience in a particular case of a household of eight or nine persons using a cooker consisting of an oven with an upper heater taking 2,000 watts and a lower heater of 1,000 watts, a 1,500-watt grill, two 8-in. 1,200-watt hot plates, and one 6-in. 750-watt hot plate. In this case a separate coke-fired boiler was used for water heating, but the author did not look upon electrical water heating as a financially impracticable proposition where a suitable tariff was in force, which took into account the practically continuous load obtainable with a thermal storage form of water heater. He urged the practicability of a quarterly charge for water heating on the basis of continuous use at the rate of 4d. per kw.-hour. In his case the average consumption for cooking was about 2 kw.-hours per day per person in winter time, and about 1.6 in the summer, or 110 and 90 kw.-hours per week respectively. He had found an increase in cost over that of coal cooking; for, whereas his annual coal and electricity cost was £23 10s. before electric cooking was adopted, it had now increased to £32 8s. 9d. The complete original outfit, including £9 4s. 5d. for wiring and £10 6s. 4d. for the coke boiler, had cost £45 11s. 3d. Subsequently an 800-watt porringer had been added at a cost of £4. The prices of first-class cooking appliances would probably decline as they were manufactured in larger quantities. Again, the wiring as usually carried out in screwed tubing seemed unduly expensive, and he suggested that armoured cable, without further protection, would answer the purpose.

Going into details of cooking equipment, he spoke of the necessity for a main d.p. switch and brightly visible pilot light near the cooker, but did not consider pilot lamps desirable on every circuit. The branch switches should be placed in some convenient place where they can be easily seen, such as on the wall near the cooker, and the main fuse should be supplemented by easily replaceable fuses for each circuit. He emphasised strongly the advantages of a thermometer in the door of the oven. With regard to the much talked-of question of the saving due to the smaller loss of weight of the meat with electric cooking, he thought that the importance of this had been rather overestimated, and that it depended more on the temperature of the oven than on the fact that the heating was done electrically. A number of his own observations had given an average loss of weight of 25 per cent. with coal, 14 $\frac{1}{2}$ per cent. with an electric oven, at the correct temperature, and 28 $\frac{1}{2}$ per cent. with the temperature about 50 degrees too high. Such statements as "if gas were provided free it would still be cheaper to cook electrically" were absurd, and only did harm to a good cause. It must not be forgotten that the roasting of joints was but a small part of the total cooking. The energy required to heat an oven was not so great as might be expected. In his case, with 3 kw., a temperature of 250° F. could be reached in five minutes, but, even so, it was preferable to avoid the use of the oven for small operations, such as keeping dishes hot, if it is not already in use. For such purposes, the author had used a portable oven consisting of a tin hood placed over an ordinary hot plate. The heating up of an oven should take place so rapidly that the heat losses had not much time to take effect, after which the input could be reduced simply to supply these losses.

There was room for improvement in the design of plug and socket connections. Mr. Cooper suggested an earthing metal ring round the socket so that the pins were not exposed at all when live, as preferable to the hand shields sometimes provided. Also the live metal of the socket was often brought nearer the surface than necessary, and could be touched when cleaning. In cases where the pins were on the apparatus itself and the socket on the flexible, it was desirable to surround the pins by a housing, and to see that no live heads of clamping screws, &c., were exposed in the terminal blocks of the flexible. There was also some risk of the helical springs, which are sometimes provided to protect the flexible where it leaves the plug, becoming live by wearing away by the insulation or careless stripping of the flexible. A trumpet-mouthed opening to the plug was a better protection. Ordinary flexibles were very liable to break on account of being continually subjected to bending, and many of the usual cords supplied were quite unsuitable to this class of work. Special patterns were, however, now becoming available. In seeking to meet this need, cable-makers seemed

to be following two opposed methods. The first was to make the flexible wire so that it bends very easily and will therefore adapt itself. The second was to make the flexible wire rather stiffer, so that any bend will be less sharp. The author is inclined to think that the latter is the better alternative because the breaking of the copper strands depends on the sharpness of the bend.

The author has tested a large number of samples in a special machine, subjecting them to repeated bending many thousands of times, and a great variety of results were obtained. He also measured the "inflexibility" by noting the overhang of a weighted wire allowed to hang over a right angle corner. From the user's point of view, both the diameter and inflexibility should be small. The special flexible wires mostly have larger conductors than the ordinary ones, and have larger diameter and less flexibility. Many are circular. Although the circular type has the advantage of better shape for mechanical wear, from the electrical point of view, this form, he imagines, has the disadvantage that if one conductor fails there is greater chance of a short-circuit than with twisted twin conductors. Some of the armoured wires failed through failure of the wire braiding, which thus allowed more severe bending at this particular point. The author thinks it is apparent from these tests that ordinary flexible wires vary very much in their mechanical properties, and that it is not necessary to depart from the ordinary type to get excellent results. On the basis of the test as carried out, he thought that a flexible wire suitable for portable apparatus should be capable of bearing 200,000 complete bends without breaking. It is not an uncommon thing to see long lengths of flexible cable lying about the floors of houses for supplying radiators. In course of time this flexible cable must wear and eventually develop a fault. As a rule radiators are fitted with switches controlling all the heating elements, the result being that the flexible wire is left permanently alive. In the Institution Wiring Rules it is recommended that radiators should be made so that they can only be partially controlled in this way, but no heed is generally paid to this very desirable rule. This is due to the wrong idea that convenience should take precedence of safety.

Mr. Cooper emphasised the necessity for earthing all cooking apparatus efficiently; a point to which insufficient attention was paid, unfortunately, he said, there was no authority having the power to enforce such earthing. There was particular danger in having unearthing accessory apparatus alongside an earthed cooker. He suggested that the Institution should draw up rules as to the proper methods to be employed for earthing and for testing earth connections. The standardisation of socket connections on electric irons, &c., might be considered at the same time.

In the latter part of the paper, the author said a few words on the much-discussed question of tariffs. He objected to primary charges based on such a figure as rateable value, which has no relation to the amount of working apparatus in use, and urged the necessity of a low secondary charge. He said that, in his own case, some of the tariffs in use by the members of the Point Fives Association would have shown very little difference in the cost between electricity and coal. With regard to maintenance, his oven had shown no defect in the thirteen months of use, and the grill only gave one partial failure. He was inclined to think that the hot plate was the most vulnerable part of the equipment. But whatever the cost of maintenance might ultimately be, it was of vital importance to the consumer, and there should be more co-operation between the station engineer and the manufacturer in the matter.

The daily load factor of his installation worked out at 7.1 per cent., or, for the working period of 15 $\frac{1}{2}$ hours, a little over 10 per cent. Since the product of load factor and diversity factor cannot exceed 100, it follows that the diversity factor of this particular type of consumer could not be greater than 10, but it might reach that satisfactory figure. Actual records showed how the load is distributed throughout the day and varies from day to day, and considering the diversity of different classes of consumers and that the lighting and cooking peaks do not coincide, it was evident that the cooking load was a very desirable one from the central station point of view.

The discussion in London was long and at times the author was rather severely handled. Fourteen speakers took part, and a good proportion severely criticised the author for drawing general conclusions from an isolated experiment. Mr. S. T. Allen (Chief Electrical Engineer, Wolverhampton), Mr. R. S. Downe (Brompton & Kensington Electricity Supply Co.), Mr. F. S. Grogan (British Electric Transformer Co.), Mr. Haydn Harrison, Mr. A. H. Seabrook, Mr. F. Charles Raphael, and

Mr. A. Nicholls Moore (Chief Electrical Engineer, Newport, Mon.) all found serious fault with the Paper and the general impression it would create. Attention was called to the enormously high price of the cooking apparatus which the author had purchased. Mr. Downe mentioned an installation consisting of a cooker for a private house of about the same size as Mr. Cooper's, 60 ft. of 7/18 paper-insulated, lead-covered cable with double-pole switch and double-pole cut-out, which gave every satisfaction and cost £14. Such an outfit could be hired out for 5s. or 7s. 6d. per quarter. A further reason for hiring was given by Prof. J. T. Morris, viz., the different conditions of supply in various districts, which might render a cooker in one district useless in another. Mr. F. S. Grogan declared that the Paper did not by any means represent the general experience all over the country. In this case a very useful cook had been extraordinarily extravagant, the apparatus had not been efficient, or Mr. Cooper had been too much in the kitchen himself. The Paper was a murderous submarine attack on the excellent progress which had been made with electric cooking. Mr. Haydn Harrison, who had been a user of electric cooking apparatus for years, said his experience had been very different from that of Mr. Cooper. In his house the total yearly expenditure on coal, gas, and electricity had not varied during the last five years, although he had put in electric cooking (at 1½d. per unit) three years ago. Mr. Seabrook characterised the cost of the apparatus as given in the Paper as utterly ridiculous. He could not find consumers to purchase apparatus; they had been spoiled by the gas companies and had to be supplied with the cookers on hire. Mr. Nicholls Moore thought the Paper showed that those who were giving so much attention to tariffs would be better employed if they concentrated upon the education of the consumer, if Mr. Cooper was a typical consumer. Mr. Raphael regretted that Mr. Cooper's extravagant and unsuccessful experiment should have been issued to the public under the auspices of the Institution, not only in London, but also in Leeds, Birmingham, and Manchester.

Several technical points were raised in the discussion. Mr. C. H. Wordingham mentioned that a sub-committee of the Engineering Standards Committee had been appointed to go into the question of standardisation of cooking apparatus. The difficulty here, he said, was whether standardisation should be attempted before the industry, so to speak, had settled down. He thought, however, that certain standard dimensions and standard requirements could very well be settled now. For example, the floor space of the oven, and this in turn would determine the size of the baking dishes, diameter of hot-plates, &c.

There was general disagreement with Mr. Cooper's suggestion of the use of a thermometer. The ordinary cook, it was pointed out, would not bother to use it, unless, perhaps, it could be placed above the oven and always in sight. On the other hand, the desirability of placing the switches away from the sides of the oven, and in a position easy of access, was agreed upon by all the speakers. There was not much disagreement between Mr. Cooper and most of the speakers as to the number of units used per person per day, whilst on the question of embodying a water-heating system with the electric cooker, everybody, except Mr. A. H. Seabrook, was of the opinion that this is an unwise policy and that a coke boiler is likely to give more satisfactory results. Mr. Seabrook, however, said he has a fairly large number of commercial users in Marylebone, who heat water electrically in 70 and 75 gallon tanks, and they are quite satisfied with the cost.

The question of plugs was dealt with by several speakers. It was felt that in view of the increased rating and size of radiators and other apparatus, the sooner the ordinary wall plug was done away with, except perhaps for irons, the better. Mr. Wilkinson said the general tendency is to substitute large switches. Mr. Allen thought Mr. Cooper's suggestion of an earthed ring would introduce a still more dangerous condition of things, and Mr. Raphael said that, peculiarly enough, he had only that day come across a case where shock had been obtained from a plug very similar in design. Mr. Seabrook thought the hand shield plug with the flex coming out at the side, recommended by the Home Office, quite an ideal type, and Mr. Raphael said that it would be generally agreed that the chief virtue of this plug was not so much that it prevented people getting shocks, but that it prevented any strain on the flex when putting it in and pulling it out. Mr. Allen said he had never found any difficulty in securing that the apparatus was earthed, and agreed that it was also of the greatest importance to earth utensils alongside the cooker.

Mr. Raphael regretted that the practice of dividing a cooker between the two sides of a three-wire network had not been discussed. Some makers of apparatus were against this practice and thought it dangerous, and, on the other hand, some central-station men were in favour of it.

Mr. Wilkinson and Mr. Wordingham felt that electric cookers must be made much more reliable than they are before central station can recommend them without qualification. The cost of maintenance was a serious item. No amount of juggling with tariffs, said Mr. Wordingham, would get over this difficulty.

There were some differences of opinion as to the value, from the selling point of view, of figures of comparative wastage of

weight with electric, coal and gas cooking. Mr. A. Nicholls Moore said we must be very badly off for arguments if this one had to be relied upon in view of the infinitesimal financial saving this involved. On the other hand, Mr. Downe mentioned an installation for Messrs. J. Lyons and Co. in which an experiment was carried out on four sirloins of beef, weighing a total of 125 lbs. After cooking the weight was 101 lbs., or a loss of 18·8 per cent. The manager at Cadby Hall had told him that the average shrinkage with a coke fire was 30 per cent.; the gain on these four joints would represent a money saving of 10 per cent. Mr. Seabrook, on the general question of cheapness with electric cooking compared with any other method, said he is now putting in, for Messrs. Selfridge, what will be the largest electric kitchen in the world, capable of cooking for the whole of their employees, and, as most people outside Marylebone probably did not know, Messrs. Selfridge were not the sort of people to put in any unknown or new-fangled equipment unless "they saw dollars at the end of it."

The Enemy's Trade.—An extensive report on the war and British economic policy has been issued by the Tariff Commission. The situation of a number of industries is discussed; with regard to electrical matters attention is specially directed to the large range of electrical goods which have come to this country from Germany, especially of the cheaper kind. These German goods include A.C. drills, small pulley blocks, electric torches and their batteries, electric toys, enamelled ware, small electrical instruments, motor-car equipment, &c., telephones, electrically-driven cow-milkers, insulators, insulating materials, welders, frequency meters, burglar alarm systems, loom motors, electric sirens, miners' lamps, ozone generators, bells, electric blasters, electric punkahs, electric heating and cooking apparatus, resistance wires, massage vibrators, rheostats, lamp testing sets (wattmeters), sign flashers, small signs, Rhumkorff coils, electro-medical apparatus, dental apparatus, fairy strip (Pixielite), small portable tools, sewing machines driving systems, permanent magnets, X-ray bulbs, Geissler tubes, buzzers, projectors, stage arc lamps, metal dimmers for stage work, Christmas-tree illuminations, vacuum cleaners, photometers, carbon brushes, air filters for turbo-generators, asbestos grid resistances, single-phase commutator motors, Edison screw sockets, cheap switches, &c. The view is expressed that, in general, the possibilities for permanently capturing German trade is largely dependent on some guarantee of security from unrestricted foreign competition after the war, and that the necessary capital for extensions will not be forthcoming in the absence of safeguards against post-war dumping.

A Primary Cell Sensitive to Light.—At a recent meeting of the Physical Society, Mr. A. A. Campbell Swinton described a cell which reverses its polarity when illuminated. If two plates—one of zinc and the other of tinned copper coated on one surface with selenium and varnished with enamel over the remainder of its surface—are immersed in tap-water, the electric current through a galvanometer connected to the plates shows that in the dark the zinc is electro-positive to the selenium, while the result of light falling on the selenium is to increase the effect. If, however, instead of zinc, carbon or copper is employed for the non-coated plate, the interesting result is obtained that, while the selenium proves to be electro-positive to the carbon or copper in the dark, it immediately becomes electro-negative to carbon or copper the moment it is illuminated, this being easily shown by the deflections of the galvanometer in contrary directions as the light is turned on and off.

Industrial Conditions After the War.—Mr. D. E. Roberts, chairman of the Western Local Section of the Institution of Electrical Engineers, delivered his address at a meeting at Cardiff on Feb. 23rd, when Sir John Snell, President of the Institution, paid a visit to the Section. Relating the results of observations he had made in industrial Germany before the war, he said the progress made there in labour-saving equipment during the last few years was extraordinary, and must have been due to fear of future labour conditions. In addition to this great productive power he called attention to the advanced state of technical training in Germany, and urged his hearers not to under-estimate what they would have to compete with when the war was over. Our position could only be satisfactorily ensured by putting our works in excellent and high order, and filling them with highly trained men.

The Diesel Engine Users' Association.—At a recent meeting of this Association, the President (Mr. J. E. Edgcome) announced that further particulars were being obtained in connection with the use of Mexican oil fuel, and the subject would be brought up for discussion at a future meeting. The design of certain mechanical details of Diesel engines was discussed in relation to a recent breakdown at Oxford, due to failure of connecting rod belts. The next meeting of the Association will be held on Wednesday, March 17th, at the Institution of Electrical Engineers, when the question of insurance of Diesel engines against breakdown will be discussed. Information concerning the Association can be obtained from the Acting Hon. Sec., Mr. Percy Still, 19 Cadogan Gardens, S.W.

THE ORGANISATION OF THE ENGINEERING INDUSTRY

THE present situation of the engineering industry and the means desirable for dealing with it have been subjects of close investigation by the Engineers' Club, Manchester. Not only have debates been held on various aspects of the question, but a sub-committee has been appointed to go into the matter, and to frame recommendations. We have now received from Mr. E. L. Hill, hon. secretary of the club, a copy of this sub-committee's report. The important fact is first insisted upon that before the war our engineering export trade had not been progressing satisfactorily for some years, while Germany's rate of progress had been phenomenal. The sub-committee is not concerned with the debateable question of how long the German rate of progress could have been maintained had she not cut her own throat by going to war, but inquires into the causes of the success obtained, and summarises them in the one word—organisation—the very thing that it considers to be the weak spot of the British engineering industry. The only way to compete with even moderate success for foreign business, it asserts, is by voluntary organisation and co-operation. The only alternative (which it would be sorry to see) is the formation of trusts and combines on the American and German plan, which is foreign to the British spirit of independence. The sub-committee, therefore, recommends the formation of an association, on a non-trading and "non-interference-with-prices" basis, comprising British manufacturing concerns in all branches of engineering, with a strong representative council that could speak with a powerful collective voice in matters in which the Government or Parliament play a part. Such an association should have a central bureau or exchange, as well as branches in provincial towns and overseas. Some idea of the scope proposed is obtainable from the following list of departmental standing committees which are suggested:—Parliamentary and General Purposes, External (Sales) Organisation, Internal (Producing) Organisation, Patents and Inventions, Technical Education, Publications and Advertisements, and Finance. One of the principal objects of the first of these would be to urge the Government to appoint a Minister of Industry and Commerce, and to carry out various reforms. The sub-committee, in its report, admits that there are in existence somewhat similar organisations with more restricted objects, and makes it clear that it desires co-operation or amalgamation, rather than competition with these organisations. The report is signed by Messrs. W. A. Bristow, J. M. Dale, H. Derwent Simpson, and H. T. Wilkinson.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The accounts of the Guernsey States Telephone Department for the year 1914 shows a net profit of £769 after providing £1,409 for depreciation, £369 for sinking fund, and £287 for special sinking fund.

There have been considerable complaints recently of the working of the Hull municipal telephone system, and, as a result of a long and lively debate at the last meeting of the Corporation, the Telephone Committee was instructed to investigate and report. It is admitted that there have been grounds for complaint, but the main cause is attributed to the diminution in staff owing to enlistments.

A dividend of 8 per cent. is recommended on the ordinary shares of the Automatic Telephone Co. for 1914.

An article in the *Electrical World* (New York) by Dr. L. de Forest describes some recent developments of the well-known hot filament vacuum oscillation detector—named by him the "Audion." He found that if the filament was heated to an unusually high temperature and only a small capacity used in series with the grid, the apparatus behaved as a miniature generator of undamped waves, and a bulb in this condition he terms an "ultraudion." Subsequently, when experimenting with the apparatus in connection with its use as a telephone relay, he found that two such ultraaudions connected in cascade could react on one another; the one would reinforce the oscillations of the other, and if the two were slightly differently tuned a powerful "beat" tone would be produced. Thus the apparatus could be used as an amplifier of received waves and as an exceedingly sensitive detector of undamped oscillations. For this purpose one bulb with a suitable oscillating circuit, however, is usually sufficient. Such a detector has been in use for some months

in the U.S. naval wireless stations at Arlington, at Washington, New York, and elsewhere, and signals from the German undamped wave stations have been received with ease. In addition to telephonic reception, the apparatus has been used for very high speed work by recording the messages on the moving steel band of a telephone and reproducing them more slowly afterwards for transcription. For the purpose the heat pitch of the received signals is made very high, so that the signals are satisfactorily audible when the wire is being run slow enough to read the signals by ear.

ELECTRIC TRACTION NOTES

Motor-omnibus competition with electric tramways is growing up in various forms in different parts of the United States. Particularly in the west small petrol cars carrying from five to seven passengers are being run by irresponsible owners over street routes, and are generally known for some reason as "jitneys," but it is generally thought in electric railway circles that their competition cannot last through financial reasons. Apart from this there is a movement for running electric omnibuses at a slightly higher fare than the trams, for which the attraction is held out that overcrowding is not allowed. The *Electric Railway Journal* also speaks of a scheme for running storage-battery omnibuses in New York in direct competition with all other means of transportation at a 5-cent. fare. These vehicles carry 36 passengers and weigh about 5 tons, including the battery, and have a maximum speed of 18 miles per hour. A motor said to be rated at 2½ h.p. is geared to each of the four wheels. The total costs, including interest and depreciation, are estimated at 21·8 cents (about 10·8d.) per car-mile.

The volume of the Proceedings of the Institution of Railway Signal Engineers just issued shows considerable activity of our Association that is still young, and in its second year numbered 191 members, and is now under the Presidency of Mr. J. Sayers. The following Papers are printed with the discussions thereon: "Characteristics and Efficiency factors of some Typical Electric Signalling Circuits," by Mr. G. H. Crook; and "American Signal Practice as Compared with British Practice," by Mr. A. H. Rudd.

Electric Battery Vehicles.—A lecture on this subject was given by Mr. W. E. Warrilow on Saturday last at a meeting of the Birmingham and District Electric Club. The author dealt principally with commercial vehicles, and said that the field of the electric vehicle was for short distance, moderate speed, frequent stop service, while steam and petrol cars were better fitted for long distance and medium distance infrequent stop service. With regard to the design of chassis, the tendency was to employ a single motor driving by gear or chains on to a differential countershaft, retaining the final side chains, which are fast disappearing in other branches of automobile engineering. He preferred the batteries above the frame rather than underslung. In comparing the alkaline and lead batteries, he enlarged upon the mechanical advantages of the former and the electrical advantages of the latter. The moderate speed of the electric vehicle was a distinct advantage both from the maintenance and traffic points of view. In conclusion, he spoke of the success of the movement in America. In the discussion, Mr. Roberts said that battery tractors might replace horses in quarries, and Mr. W. A. Jackson announced that in view of all the petrol 'buses at West Bromwich having been impressed by the War Office, Edison battery 'buses were about to be employed. These were more costly and slower than petrol vehicles, but the makers guaranteed a saving of £400 per annum in running expenses. If these were satisfactory, they would replace their horse-drawn street-cleaning and dust-collecting vehicles by electric cars. Mr. Walker emphasised the crudity in design of most American electric vehicles, and Mr. R. J. Mitchell explained the constructional features of the Edison battery.

Electrical Canal Haulage.—A scheme of electrical haulage for barges passing through the New Harecastle tunnel of the Trent and Mersey Canal, has recently been inaugurated, and is described in the *Colliery Guardian*. The tunnel is 2,926 yards long, and a steel cable is laid in the bed of the canal, and is made fast a short distance beyond each end. An electrically-worked barge hauls itself along the cable by a winding gear driven through gear by two 15 h.p. Royce motors, either or both of which can be used by a system of clutches. Current is supplied by a 115 cell chloride storage battery capable of a discharge of 150 amperes for seven hours. This barge tows a series of 15 to 18 boats at about two miles per hour. Two such towing barges are provided, and a special charging station has been established containing two 45 kw. sets driven by Campbell gas engines working in conjunction with a gas-producer plant.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS. A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,434.

I wish to recover copper from pickling vats, of which we have a large number, each 9 ft. by 4 ft. by 4 ft. It is desired to deal with the liquid from six such tanks per week. It is proposed to use an electrolytic recovery bath, 4½ ft. by 2½ ft. by 3 ft., with a lead lining, forming the cathode and carbon anodes. What voltage and current density will give the best results, and is the scheme likely to be commercially profitable? The solutions to be dealt with nearly reach saturation.—
"J. L. L."

(Replies must be received not later than first post, Thursday, March 25th.)

ANSWERS TO No. 1,432.

How can one calculate the "whirling" or critical speed of a 5-ft. mild steel transmission shaft 1½ in. diameter without any revolving masses on it (a) when running in plain bearing at each end, and (b) when running in freely swivelling bearings?—"UNIT POLE."

The first award (10s.) is given to "L. R." for the following reply:—

The case (b) having swivelling bearings is best considered first. Such bearings can be taken as merely supporting the shaft at each end, and the critical speed (lowest value) in that case is calculated from the formula:—

$$p \times l^2 \sqrt{\frac{w}{gEI}} = \pi^2$$

where $p = 2\pi n = 2\pi \times$ revs. per second

l = length of shaft = $5 \times 12 = 60$ " in this case

w = load per inch = say 8.18 lbs.

g = 32.2×12 inches per second per second

E = Young's modulus = say 29×10^6 lbs. per sq. in.

I = moment of inertia of section = $\frac{\pi}{64} d^4$

d = diameter = $1.75"$

The proof of the formula is somewhat complex, but is to be found in *ENGINEERING*, 1909, pages 135 and 205 (Vol. 88). Transposing:—

$$n = \frac{60 \times \pi}{2 \times l^2} \sqrt{\frac{gEI}{w}}$$

$$\text{(in revs. per min.)} = \frac{60 \times \pi}{2 \times 60^2} \sqrt{\frac{32.2 \times 12 \times 29 \times 10^6 \times \pi \times (1.75)^4 \times 12}{8.18 \times 64}}$$

$$= 2280 \text{ revs. per minute}$$

This is the fundamental critical speed. The next is four times that value; the third nine times, and the fourth 16 times—progressing as the square of the term.

Case (a), dealing with non-swivelling bearings, is very difficult to solve, because so much depends on the workmanship and like factors. In practice, for purposes of calculation, the bearings are assumed to act as swivelling bearings, because it is found (especially after the brasses have been scraped) that the clearance is such that, as regards vibration, free support is given. It is possible to ascertain the limiting value for non-swivelling bearings by assuming that they "fix"

the shaft at each end. The critical speed in this case is related to that given above in accordance with the ratio $\pi^2/22.37$ —the first value being divided by π^2 and multiplied by 22.37 thus gives the fundamental critical speed in these conditions as 5,150 revs. per min. A closer approximation can be made by considering one end "fixed" and the other supported. In this case one must use 15.41 instead of 22.37. Thus

$$\frac{2280 \times 15.41}{\pi^2} = 3560$$

which is the critical speed on that assumption.

To find the higher values the following figures must be substituted for 22.37:—Both ends "fixed": 61.62, 121, 477.2. One end "fixed" and the other supported: 49.96, 104, 178.

The second award (5s.) is made to "Alpha," who writes as follows:—

The critical speed of a solid shaft running in two bearings, with no overhang and no load other than its own weight, is given in revs. per minute by

$$N = K \frac{d}{L^2}$$

where d = diameter of shaft in inches, L = length of shaft in feet, and K is a constant depending on the material of which the shaft is made and on the type of bearing. For a steel shaft Prof. Dunkerley gives the following:—

(a) When the bearings are of the parallel type, and long enough to fix the direction of the shaft at each end, $K=74,971$, which corresponds to a critical speed of 5,350 r.p.m. in the case in question. Actually the critical speed will be slightly lower than this, since the oil film will prevent a bearing of any normal length from absolutely fixing the direction of the shaft.

(b) When running in freely swivelled bearings, $K=32,864$, giving a critical speed of 2,300 r.p.m. in this case. If the bearings are of a heavy type, comparable in mass to the shaft, this will tend to raise the critical speed, as will also the friction of the bearings on their seats, but the correction will be small if the bearings are light and swivel freely.

It must not be assumed, because the theoretical value of K is given to a high (apparent) degree of accuracy, that vibration trouble will only be experienced at exactly the calculated speed. The critical speed is that at which the time of one revolution is equal to the time of one complete vibration of the shaft, if it is bent slightly to one side and released. This in turn depends on the weight per cubic inch and the elasticity of the shaft, the figures given being averages applicable to ordinary mild steel. The calculated figure is therefore only approximate, but in a simple case like the present it should be within, say, 5 per cent. Further, the corrections for oil film, bearing swivel friction, &c., cannot be given with any degree of accuracy. Apart from this, there will be some slight vibration at all speeds, but if the shaft is initially straight and well-balanced, it is probable that the vibration will not be serious until the critical speed is approached, say, within 10 per cent. of the true value. Above this speed, the vibration will rapidly increase, and at the critical speed it is only limited by the friction of the bearings in their seats, and the molecular friction due to the alternating strains set up in the apparatus. If the speed is further increased, the vibration dies away, but unless the shaft is taken rapidly through the critical speed there is a danger of the vibrations building up to such a pitch as to give the shaft a permanent set, and possibly to break either the shaft or the bearings. If the shaft already has a permanent set sufficient to cause noticeable unbalancing, the vibration will be serious long before the critical speed is reached.

If either end of the shaft in question projects beyond the bearing, "Unit Pole" should consult Prof. Goodman's "Mechanics Applied to Engineering," pp. 493 and 685-7, where various cases are considered, and references given to Prof. Dunkerley's original papers on the subject.

ANSWER TO CORRESPONDENT

WHIRLING.—You will be enabled to solve your further problem on the subject treated above by consulting the references mentioned in these replies.

Russian Equivalents.—A useful card of tables of Russian weights, measures, and money has been issued by the Central Translations Institute (Danes Inn House, 265 Strand, W.C.) at the price of one shilling net.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 11th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

3,191/1. Wireless Telegraphy. G. O. SQUIER. Improvements in the "wired wireless" system of telegraphy, in which the tuning of the line is effected independently of the detector circuit by a variable inductance in the high-frequency bridge in series with the low-capacity condenser, which forms a part thereof. (Five figures.)

3,722/14. Cooking. A. F. BERRY. Electric cooking ovens, &c., in which the heating elements are provided with ribs or fins to increase their effective surface, and guide plates direct the current of air over these fins as it circulates. By this means rapid heating up can be obtained with elements at a moderate temperature. (Five figures.)

3,831/14. A.C. Railways. B.T.-H. Co. (*G.E. Co., U.S.A.*). Improvements in a system of avoiding interference with neighbouring telephone circuits, &c., by connecting the trolley line and return circuit by current transformers; consisting in connection between the rails and middle point of such transformers and reactive connections between the rails and points on the return conductor between the transformers. This is to direct the current into the return current so that its inductive effect more completely neutralises that of the trolley line at every point. (Two figures.)

4,235/14. Lamp Leading-in Wires. B.T.-H. Co. (*G.E. Co., U.S.A.*). A method of covering wires with a coating of a borate to facilitate sealing into glass, and the use of copper-plated iron-nickel wires so coated.

8,821/14. Fuses. B.T.-H. Co. (*G.E. Co., U.S.A.*). Surrounding enclosed fuses with a packing of loose particles of incompletely hydrated metasilicic acid. (One figure.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

DYNAMOS, MOTORS, AND TRANSFORMERS: B.T.-H. Co. (*G.E. Co., U.S.A.*) [Motor control] 4,554/14.

Heating and Cooking: LONDON [Heating apparatus] 4,943/14.

Ignition: MUELLER [Magneton] 4,562/14; JACKAMAN [Sparking plugs] 14,558/14.

Incandescent Lamps: REGNART [Incandescent lamps and connectors] 4,934/14; VICE [Lamp locks] 4,964/14.

Instruments and Meters: CAMBRIDGE SCIENTIFIC INSTRUMENT CO. and APTHORPE [Resistance thermometers] 20,248/14.

Switchgear, Fuses, and Fittings: B.T.-H. Co. (*G.E. Co., U.S.A.*) [Thermo-electric regulators] 4,472/14; JAMES [Thermal switch] 4,618/14; SCOTT [Sign flashers] 4,798/14; ST. HELENS CABLE & RUBBER Co. and WHITE [Switches] 5,069/14; ROSLING, NICHOLS and W. T. HENLEY'S TELEGRAPH WORKS Co. [Fuse boxes] 5,359/14; B.T.-H. Co. and WEDMORE [Protective devices] 5,455/14; TEASDALE [Pendants] 12,746/14; TUCKER [Switches] 14,548/14.

Telephony and Telegraphy: WESTERN ELECTRIC Co. (*Woodward for W.E. Co., U.S.A.*) [Meters for automatic telephones] 5,115/14; GIRARDEAU and BETHENOD [Spark gaps] 14,884/14.

Traction: CHRISTMAS [Motor-car lamps] 4,655/14; THOMPSON [Communication with trains] 5,903/14; MULLANEY [Electric railway systems] 19,944/14.

Miscellaneous: GRATZE [Electric horns] 4,747/14; FYSON [Contact breaker] 5,890/14; NOVITAS FABRIK ELEKTRISCHER APPARATE A.G. [Automatic apparatus for lighting and extinguishing gas lamps] 6,159/14; BIBOLINI & RIBONI [Electrostatic separators] 7,274/14; SOC. ANON. LE CARBONE [Connections] 8,695/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

DYNAMOS: LAMMIE, 2,535/15.

Incandescent Lamps: [Filaments and mounting] 17,023/14.

Miscellaneous: FR. KRUPP A.G. [Sparkless circuit breaking] 2,462/15.

Applications for Suspension

10,457/06. B. HOPFELT; 2,711/10, 20,634/10, 9,941/11. SPECIAL FABRIK FÜR ALUMINIUM SPULEN & LEITUNGEN G.m.b.H. (Berlin) and 27,651/12. J. LOEWENTHAL. Aluminium Conductors.

Applications by G. H. Wilson, trading as the Manchester Armature Repair Co., for the suspension of these enemy-owned patents, will be heard on March 23rd. All relate to the manufacture of coils of aluminium wire with the only insulation between turns consisting of a film of oxide or other aluminium salt on the surface. In the last-mentioned, a film of aluminium compounds is electrolytically deposited on a conductor of other metal.

Amendment Allowed

11,886/13. **Commutator.** C. ZENK. Certain verbal alterations have been allowed in this specification, which is for a process of constructing commutators with a centre of moulded insulating material.

Opposition to Grant of Patents

Grants have been allowed on the following specifications in spite of opposition:—

14,524/13. **Telephony.** W.AITKEN. This specification describes a complete system of semi-automatic telephone working.

19,443/13. **Winding Engine Control.** B.T.-H. Co. and R. D. GRIVEN. This is for a system of controlling three-phase winding motors by liquid rheostats with variable liquid level, in conjunction with a pneumatically-actuated reversing switch. A separate tank is used for each direction of rotation of the motor.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

6,107/01. **Meters.** A. C. HEAP and W. O. SMITH. A motor meter in which the fixed coil is spherical in shape, and the moving coil is mounted outside and close to the fixed coil.

The following are the more important Patents that have become void through non-payment of renewal fees.

DYNAMOS, MOTORS, AND TRANSFORMERS: R. BRAUN [Single-phase motors] 24,106/05; B.T.-H. Co. and F. H. CLOUGH [Protection of coils in slots] 25,834/07.

Switchgear, Fuses, and Fittings: W. LAMBERT [Lamp-holders for ship lighting] 23,915/01.

TRACTION: H. LEITNER [Train lighting] 25,784/04.

MISCELLANEOUS: C. R. JAY [Electric rivetting machines] 25,518/08.

Steel for Permanent Magnets.—In a Paper recently read before the Physical Society, Prof. S. P. Thompson discussed the criteria which had been proposed for steel for permanent magnets. Whatever the form of the magnet, he said that the prime requisites were large remanent magnetism and high coercive force, and, since Hopkinson's determinations of 1885, it had been supposed that for the purpose of making permanent magnets the best material would be that for which both of these quantities and, consequently, their numerical product, should be as high as possible. Recently Mr. J. A. Mathews and, independently, Mr. J. R. Ashworth, had proposed to take the ratio instead of the product of these quantities. He produced a table of such figures for a series, showing that the use of the ratio as a criterion of magnetic usefulness leads to most absurd results. As an example, annealed manganese steel (almost non-magnetic) should, judging from the ratio, be six times as good as Remy steel, whereas in reality, for equality of pull, a magnet of manganese steel would require to be 312 times the weight of that made of Remy steel.

The Electric Vehicle.—The second issue of the official journal of the Electric Vehicle Committee contains several articles regarding the use of electric vehicles in public service, and successful examples are referred to in a tower wagon at Ilford and a van which is used for a number of purposes by the West Ham Mains Department. An interesting article by Mr. W. H. L. Watson deals with the way in which the central station engineer can help in the pioneering work of introducing electric vehicles, and Mr. R. Rankin describes an overload detector for traction batteries. Among the many interesting items of information we note that the South Shields Edison battery omnibuses are about to be impressed into Army service. These will be, we believe, the first electric vehicles to "join the Colours." An illustrated supplement gives a most effective view of an American electrically-propelled fire-engine.

"ELECTRICAL ENGINEERING" TRADE SECTION

THE CHOICE OF REFLECTORS

LAST week we had an opportunity of seeing, at Mazda House, a very large variety of "Mazdalux" reflectors which have been standardised by the British Thomson-Houston Co., Ltd. So numerous are the different patterns that the purchaser would experience an *embarras de richesse* in making his choice of the most suitable for his requirements, were it not for the fact that the company assist him by placing at his disposal an extremely useful pamphlet, explain-

outside; steel with similar finish; and steel with white vitreous enamel both inside and outside. There are also eight styles of caps or housings (four of them already fitted with all porcelain holders).

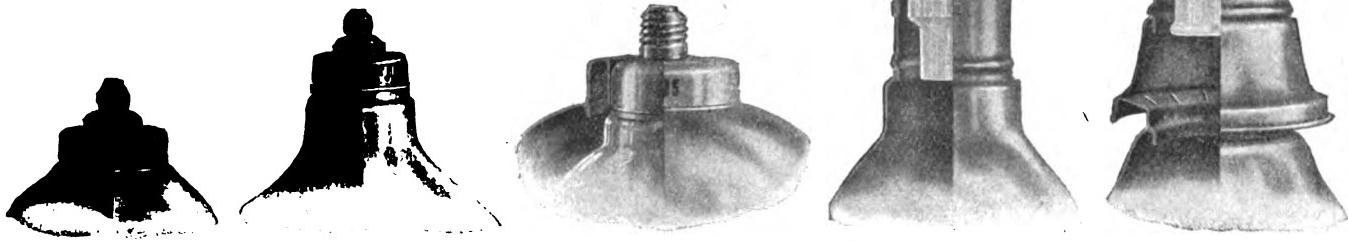

FIG. 1.—SOME OF THE TYPES OF CAPS AND HOUSINGS.

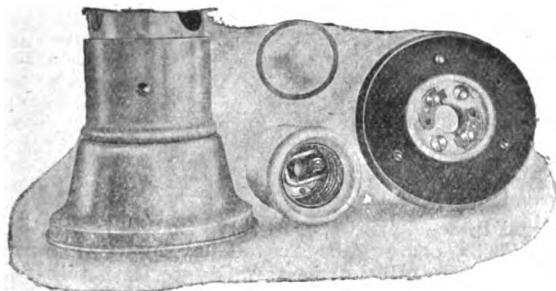

FIG. 2.—ONE OF THE HOUSINGS DISASSEMBLED.

FIG. 3.—EXTRA-EXTENSIVE REFLECTOR.

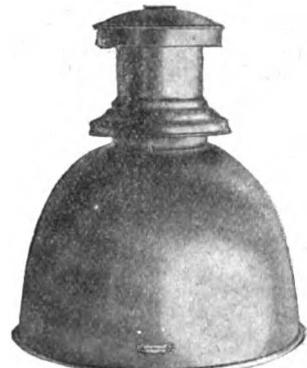

FIG. 4.—DITTO FOR $\frac{1}{2}$ -WATT LAMPS.

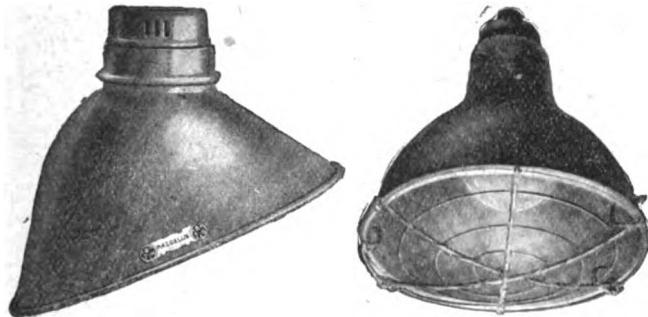

FIG. 5.—15° ANGLE TYPE. FIG. 6.—SPECIAL LOCAL LIGHTING TYPE WITH WIRE CAGE.

ing the uses of the various types, and including a chart which gives the correct size of lamp for different spacings and uses, and the height above the ground at which each class of reflector should be placed.

The new types of "Mazdalux" reflectors differ from the older types in the housings (see Fig. 1), and the fact that they have been developed to include half-watt types throughout the range; and, from what has been said, it is evident that, no matter what industrial lighting condition may arise, there should be one or more out of the many varieties of "Mazdalux" reflectors which will exactly suit the needs. In the first case, the reflectors are available for lamps ranging from 10 to 3,000 candle-power, and for each size of lamp there are reflectors for ten different forms of distribution, viz., dispersive V.E., extra extensive, extensive, intensive, focussing, concentrating, 15 deg. angle, 30 deg. angle, 45 deg. angle, 90 deg. angle. There are also special types for local lighting of machine tools, &c., and also ceiling fittings. The reflectors are made in three classes, i.e., aluminium with special aluminium and matt reflecting surface and French-grey enamel

We are informed that the "Mazdalux" reflectors are entirely made in this country.

Figs. 3, 4, and 5 illustrate three of the most useful patterns, and Fig. 6 is a reflector with a wire guard designed to take a seal which prevents either the lamp or reflector from being tampered with.

AN ELECTRIC TURRET CLOCK

THE first electric turret clock to be purchased by the Post Office has just been supplied by Gent & Co., Ltd. (Leicester), to the G.P.O. at Birmingham, and is placed on the bridge connecting the new and old portions of the building. It is bolted to the face of the bridge, the dial being 5 ft. in diameter, and provided with twelve distinguishing marks in lieu of the ordinary Roman characters, as advocated by the late Lord Grimthorpe. It is arranged for internal illumination, which is provided by electric lamps within a reflector, disposed behind the dial. The clock is fitted with the firm's well-known "waiting-train" movement, the small amount of current for which is taken from the accumulator in the building, which has been installed for general purposes. The "waiting-train" mechanism is under the constant control of a master clock, and control is effected by the half-minute impulses in a simple manner, dispensing with contacts or additional batteries. The hands are exposed directly in the open, so that a clear reading of the dial is obtained under all conditions, and glare and reflection from a glass cover are avoided. The great power which the "waiting-train" movement holds in reserve renders a covering glass unnecessary. The power produced by this mechanism is in direct proportion to the load put upon it, so that the hands cannot be stopped by snow or the most severe gales. A few weeks ago Londoners were much concerned to find all their public clocks stopped or otherwise affected by the heavy gale that swept over the metropolis,

even Big Ben being half an hour slow, St. Paul's clock being stopped at 6.16, while the Fleet Street clocks at 1 p.m., commencing with the Law Courts and going eastward, read 9.26, 9.50, 12.58, 1.5, and 12.47 respectively. The clock supplied by the company to the Royal Liver Building, Liverpool, which is the largest in the world, is worked on the same "waiting-train" principle, and we are informed that, despite many gales and snowstorms, it has kept excellent time since it was started in 1911.

LAMP STANDARDS OF INSULATING MATERIAL

WE illustrate here two forms of portable standard lamps recently introduced by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), in which all metal parts that might come in contact with live conductors are fully protected by insulating material. These are intended for workshop purposes, and, owing to their insulation, are quite in accordance with the Home Office recommendations without any earthing connection. Fig. 1 shows a bench standard (Patent No. 5,418/11) of strong insulating material, with the few metal parts entirely insulated, while the holder is enclosed in a fireproof insulating "Coates"

FIG. 1.—"INSULAH" BENCH STANDARD.

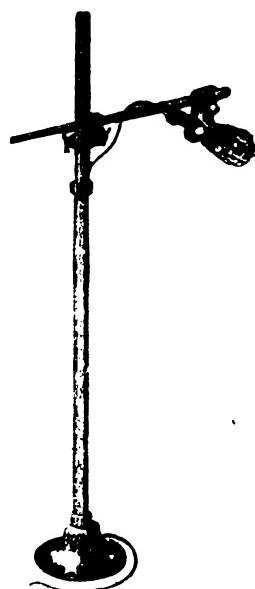

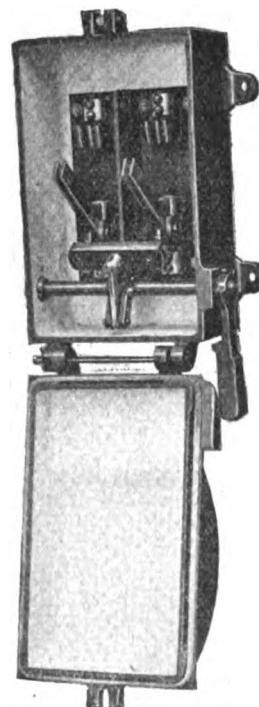

FIG. 2.—"INSULAH" FLOOR STANDARD.

shield of the well-known pattern. The floor standard shown in Fig. 2, made under the same patent, is of substantial construction, and stands about 5 ft. high. The stem is of ash wood fitting into a heavy cast-iron base. On the stem slides an adjustable metal collar. The transverse ash wood rod is attached by a metal clamp to the upright stem, and at the extremity a wooden clamp holds a G.E.C. fibre insulated hand-lamp of strong construction to withstand rough usage. Neither on the stand nor in the hand-lamp are metal parts which can come in contact with current-carrying wires.

ELECTRIC VEHICLE CHARGING SIGNS

THE General Electric Co., Ltd. (67 Queen Victoria Street, London, E.C.) have been appointed official manufacturers to the Electrical Vehicle Committee of the Standard Design of Illuminated Box Sign for Charging Stations, and for garages where charging facilities are provided. The sign, wired complete, with terminal box, can be arranged for bolting to the face of a wall or supporting from the usual type of bracket. This sign is described in a leaflet which the company has issued. The case is of best quality stove enamelled iron, black outside and white inside. The panels are formed of a front sheet fired with red and white permanent colours, backed by a sheet of clear glass, suitably

attached. Several standard sizes are made in the following patterns:—Swing pattern, with rings suspending from bar or bracket; post pattern, with wrought-iron clips for clamping end-on to lamp-post; end-on wall pattern, with backplate for screwing or bolting to wall; and flat-on wall pattern, with lugs for screwing or bolting to wall.

AN IRONCLAD SWITCH

OF late years there has been too great a tendency in the design of small ironclad switches to sacrifice everything to cheapness. Bases have often been made of porcelain, which has an unfortunate habit of cracking readily; brass parts have been skimped and rated far in excess of their proper current-carrying capacity; hinges have been depended upon for carrying the main current; coupling bars have been far too fragile, and operating spindles badly adjusted and far from rigid. The switch illustrated is made by Simplex Conduits, Ltd., and has been designed to obviate these defects. The switch parts are mounted on slate bases, and the case has an insulating lining, and a thick rubber gasket between the cover and the case. The cover cannot be opened when the switch is in the "on" position, nor the switch closed whilst the cover is open. It is put on the market in the 80-ampere size at the moderate price of 19s.

AN EFFECTIVE LAMP ADVERTISEMENT

THE signal in semaphore code shown below can easily be deciphered by our readers by the key in the margin. Having done so, they will not be surprised to learn that the

design is reproduced from a postcard which is being issued by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.) for the use of contractors, whose names can be overprinted on the other side.

CATALOGUES, PAMPHLETS, &c., RECEIVED

CAB-TYRE SHEATHED CABLE.—The St. Helens Cable and Rubber Co., Ltd. (Warrington) have issued an interesting booklet, which they will be glad to send to any of our readers, giving experiences of actual users of their well-known "C. T. S." cables. Success is reported in the fields of general wiring work, engineering works, iron works, for portable apparatus in various situations, in chemical works, for cooking apparatus, lift work, on motor cars, and in other more or less trying circumstances.

ELECTRIC COOKING.—A leaflet from the General Electric Co. (67 Queen Victoria Street, E.C.) gives prices and particulars of the two forms of portable electric cooker which were described and illustrated in ELECTRICAL ENGINEERING, Feb. 4th, p. 52. These leaflets can be overprinted with contractors' names and addresses.

BLOTTER.—We have received from the Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex), a convenient little signature blotter, which calls attention to the merits of Royal Ediswan drawn-wire lamps.

INSULATING VARNISH.—Leaflets from Chas. H. Blume (The White Building, Fitzalan Square, Sheffield) give particulars of several varieties of insulating varnish manufactured by the firm, including a special heavy-bodied heat-radiating insulating enamel known as "Radiolac."

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

BELTING.—The North British Rubber Co., Ltd. (Castle Mills, Edinburgh), will be pleased to send any of our readers a copy of a booklet which they have produced containing a quantity of information regarding rubber belting.

INDIARUBBER GLOVES.—A leaflet containing prices of a considerable variety of indiarubber gloves, gauntlets, &c., has been issued by L. Andrew & Co. (2 Whitworth Street West, Deansgate, Manchester).

AUTOMATIC TELEPHONES.—An interesting illustrated pamphlet from the Relay Automatic Telephone Co., Ltd. (Marconi House, Strand, W.C.), describes the latest form of the Relay automatic telephone system, which has hitherto been more generally known as the Betulander system and was described in some detail in ELECTRICAL ENGINEERING, Vol. X., p. 399, July 9th, 1914. It will be remembered that this system, which is of Swedish origin, does not depend on electro-mechanical selector switches, but effects the necessary connections, as its name indicates, entirely by means of combinations of relays.

FURNACES.—An attractive illustrated leaflet from Meldrum's, Ltd. (Timperley, Manchester), calls attention to various patterns of refuse destructor furnaces, forced draught furnaces for low-grade fuel, mechanical stokers, &c., made by them.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Batley.—A loan of £6,500 for cable extensions has been sanctioned.

Edinburgh.—Three, six, or twelve months' supply of arc lamp globes and conduit. City Electrical Engineer. March 29th.

Manchester.—A 650-k.w. rotary converter and static transformer is required. Chief Electrical Engineer, March 23rd.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Aberdeen.—Church at Cults. Architects, A. Marshall Mackenzie & Son, 343 Union Street.

Ashton-under-Lyne.—New school.

Barnsley.—New Town Hall. (£22,500.)

Bexhill-on-Sea.—Isolation hospital (£6,500).

Blackpool.—Warehouses in Cookson Street. S. H. Thomas.

Canterbury.—New school.

Cardiff.—Reconstruction of Empire (£20,000).—Isolation hospital (£18,000).—New municipal offices.

Erit.—Extensions to Sanatorium. Borough Surveyor.

Manchester.—Additions to hospital at Withington for Guardians.—Public baths at Barlow Road, Levenshulme.

Nottingham.—Three branch libraries.

Oxford.—New school.

Pontypridd.—Cinematograph theatre and block of shops. Architect, A. L. Thomas.

Reigate.—New infirmary.

Roochdale.—Reconstruction (after fire) of Lagley Spinning Mill.

Taunton.—Sanatorium. Clerk, Somerset County Council, Weston-super-Mare.

Miscellaneous

Australia.—A 150-ton electric revolving floating crane for the Naval Dockyard, Sydney. Director of Naval Works, Navy Office, Melbourne, March 24th. Copy of the specification may be seen at 78 Basinghall Street, E.C.

Dundee.—Twelve months' supply of electrical stores for the Electricity Department. General Manager. March 29th.

Edinburgh.—Six months' supply of electrical fittings for the Midlothian & Peebles District Asylum. Clerk, 19 Heriot Row.

New Zealand.—A 1,500-k.w. generating set and a three-unit exciter is required for the Lake Coleridge Power Scheme. Public Work Office, Wellington, April 30th. Copy of the specification may be seen at 78 Basinghall Street, E.C.

Nottingham.—Twelve-months' supply of electrical sundries for tramways department. Chairman, Tramways Committee, March 22nd.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Blackburn.—A contract has been placed with Messrs. J. H. Tucker & Co. for a twelve months' supply of ironclad switches.

A contract has been placed with Messrs. Venner & Co. for a twelve months' supply of A.C. and D.C. Chamberlain & Hookham meters.

Colchester.—A contract for a twelve months' supply of carbon and metal filament lamps for the tramways has been placed with Messrs. Siemens Bro. Dynamo Works, Ltd.

Colwyn Bay.—Provisional contracts have been entered into for a new power station and refuse destructor. Further progress with the scheme depends upon the attitude of the Local Government Board.

Dover.—A contract has been placed with the B.T.-H. Co. for a 1,000-k.w. turbo-alternator, with self-exciter, condenser, and pumps at £4,725.

London: Hammersmith.—The tender of the General Electric Co. has been accepted for electrical accessories. Nine other firms quoted.—Seventeen tenders have been received for a supply of insulated wires and cables, and that of the General Electric Co. has been accepted.—The tender of Messrs. Ferranti, Ltd., for a supply of 5-ampere, 10-ampere, and 25-ampere meters has been accepted, the respective prices being £2 13s. 6d., £2 16s., and £3 8s. 6d. each.

Middlesbrough.—A contract for a twelve-months' supply of Wotan and Tantalum lamps has been placed with Siemens Bros. Dynamo Works, Ltd.

Southampton.—The contract with the B.T.-H. Co. for A.C. meters is extended for a further twelve months.

Whitehaven.—A contract has been placed with Messrs. Venner & Co. for a twelve months' supply of A.C. and D.C. Chamberlain & Hookham meters.

APPOINTMENTS AND PERSONAL NOTES

Mr. Holdsworth, assistant in the test-room at the Swansea Electricity Works, has taken up a similar appointment at Walsall.

Mr. David Wilcock has been elected to a seat on the board of the Electric Construction Co. to fill the vacancy caused by the death of Mr. William Bulloch.

A switchboard attendant is required at the Wednesbury Electricity Works.

Electrical fitters are required for H.M. Dockyard, Portsmouth.

Mr. Alex. Spencer, a director of G. Spencer Moulton & Co., has been elected a director of the British Westinghouse Electric & Manufacturing Co., Ltd.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. Geo. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £71 5s. to £71 15s. (last week £69 10s. to £70).

Change of Style.—The name of the Betulander Automatic Telephone Co., Ltd. (Marconi House, Strand, W.C.), has been changed to the Relay Automatic Telephone Co., Ltd.

Cable Prices.—In consequence of increased cost of manufacture, members of the Cable Makers' Association have been obliged to advance the prices of rubber insulated cables, wires, and flexible cords by 5 per cent.

Bell Wires, &c.—The General Electric Co., Ltd., announced a 20 per cent. advance on prices of electrolier wires, and bell and telephone wires and cables.

Bankruptcies.—A second and final dividend of 2s. 2½d. in the £ is to be paid in the bankruptcy of J. G. Hilton, Electrical Engineer, 103 Exchange Buildings, Birmingham.

The statement of affairs in the bankruptcy of G. J. Parfitt, Consulting Electrical Engineer, 11 Priory Road, Keynsham, shows liabilities at £4,482, of which £2,025 are expected to rank for dividend. The cause of the debtor's failure is said to be losses in connection with the Bristol International Exhibition, and also loss of business through the war. The official receiver said he did not see any likelihood of getting a dividend for the creditors.

LOCAL NOTES

Brighton: Increase in Charges.—In consequence of the increase in the price of coal, it has been decided to increase the charge for electricity for all purposes by ½d. per unit. The public lighting rate has been increased by ¼d. per unit.

Bury: Extensions Prohibited.—Following out the instructions of the Treasury, Mr. H. R. Hooper, the L.G.B. Inspector, informed the Corporation at an inquiry last week concerning a loan of £12,460 for electrical extension that the proposed work must stand over for the present. It was pointed out that a number of local firms are doing Government work. Fresh particulars of the new works absolutely required to enable Government orders to be fulfilled are to be furnished to the Board.

Hove: 200-volt Supply.—The Council has decided to change over the few 110-volt consumers to 200-volt supply, and to bear the cost of doing so.

Leeds: Defects in Generating Plant.—A report by the Electricity Committee calling attention to the fact that expert advice is to be obtained regarding defects which have appeared in the generating plant recently erected, induced several councillors at the last meeting of the Corporation to ask for further information. It was pointed out that the duplicate sets of generating plant purchased some time ago had worked well for a time, but one of the sets had failed before the term of maintenance had expired, and the contractors had to repair it. The second set subsequently also broke down, and an investigation is now being carried out as to the causes. The contractors, at their own expense, have called in the best experts obtainable, and are doing all they can to remedy the defects.

Leigh.—A scheme involving an expenditure of £10,000 on new plant has been referred back. Arrangements had been made for taking a supply in bulk from the South Lancashire Tramways Co., but the negotiations have failed on the question of price.

Grimsby: Battery Scheme Postponed.—By a margin of

one vote the Corporation has decided to postpone the new battery scheme for six months. The Treasury would doubtless have refused to sanction the necessary expenditure in any event.

London: Hackney.—*Electricity Accountancy.*—The Special Administration Committee has been considering the question of the accountancy of the Electricity Department, and an expert Sub-Committee was appointed to examine the books. The result of this investigation is a recommendation that no alteration be made in the present system of dealing with the accounts of the electricity undertaking by which the general control and supervision of the finance is vested in the Finance Committee of the Council, the accounts being kept by the Borough Treasurer and Accountant as part of the Council's account. It is, however, suggested that a professional accountant should be employed each year to conduct a commercial audit independently of the L.G.B. auditor.

Loughborough: Rateable Value System.—In an endeavour to develop the electric heating and cooking load, a recommendation by the Borough Electrical Engineer that the rateable value system be introduced on the basis of 12½ per cent. per annum and ½d. per unit has been adopted. There was some discussion in the Council, the opinion being expressed that this new policy on the part of the Council will be a serious matter for the gas undertaking.

Manchester: Barton Power Scheme and the War.—One effect of the Treasury prohibition of capital expenditure during the war is to hold up the construction of the new power station of the Corporation at Barton. Urgent representations have been made both to the Treasury and the Local Government Board for sanction to proceed with the work, as so many factories which are depending upon the Corporation supply are extending rapidly. So far the efforts do not appear to have been successful.

Truro.—In connection with the Council's application for a £10,000 loan for electric lighting, the L.G.B. has replied that the present seems hardly a suitable time for raising a loan, and asks for the views of the Council.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Deal and Walmer Gas and Electricity Co.—The Treasury has sanctioned an issue of £10,000 ordinary stock at par. The Company now has the sole right to supply electricity in Deal, Walmer, and Ringwould, and proposes to commence the installation of the necessary plant in 1916. The lists close on March 26th.

Brompton and Kensington Electricity Supply Co.—A final dividend, making 10 per cent. for 1914, is declared on the ordinary shares, the same as in the previous year. The sum of £6,500 is placed to reserve, and £5,625 carried forward.

British Electric Transformer Co.—A final dividend, making 7½ per cent. for 1914, is declared on the ordinary shares, compared with 10 per cent. in the previous twelve months.

County of London Electric Supply Co.—It was stated at the annual meeting on Monday that, in spite of the war, the new business secured last year created a record, and that had the war not taken place, 1914 would have been a year of almost phenomenal prosperity. It was hinted that the directors may find it necessary to increase the price of current owing to the increased cost of coal.

Municipal Wiring.—The Bill of the Doncaster Corporation, in which wiring and fitting powers are asked for, was before the Local Legislation Committee of the House of Commons last week. Clause 129 of the Bill gives the Corporation powers to deal in electric wiring and fittings, but it must not do any wiring work itself except between the main and the consumer's meter. Contracts may be entered into with wiring contractors provided the latter work independently of the Corporation. The Corporation must not sell any apparatus except through a contractor, but fittings and apparatus may be hired. In the latter event, the charges are to be adjusted so that there is no loss. There was no opposition to the clauses. Similar clauses were also passed on Tuesday in the Dewsbury Corporation Bill, and again there was no opposition. One clause gives the power to maintain showrooms and offices in connection with the electricity undertaking. Mr. Knight, of the Board of Trade, suggested that the clause was really unnecessary, as municipalities already had these powers under the general law, and the passing of the clause might throw a doubt upon the powers of other municipalities who had not a special Act. The Committee, however, decided to insert the clause, as they have already done in other Bills in previous sessions.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

SUMMARY

WE refer further to the position arising out of the L.G.B. having refused sanction to loans for extensions to municipal electricity works, except in special circumstances. A number of letters received from central station engineers on the subject are published (p. 126).

THE wiremen engaged in the rolling stock section of the L.C.C. trams have struck work for an increase of wages from 10d. to 10½d.—Wiremen employed by electrical contractors in London are demanding an increase from 10½d. to 1s. with a 48-hour week (p. 126).

A NEW system of mains-protection, which is shortly to be used at Northampton and also on some of the circuits of the L. & S.W. Rly., is described (p. 127).

THE relative merits of watts and candle-power as a rating of incandescent lamps formed the subject of a discussion at the last meeting of the Illuminating Engineering Society (p. 128).

WE deal with a proposal for assisting to find work for women in the engineering industries (p. 128).

AN agreement with regard to a municipal showroom in Glasgow has been arrived at between the Electricity Department and the Contractors. The terms to the Contractors are favourable, although they do not, in fact, give them quite so much as the I.M.E.A. have offered to do in their Bill. The main point is that the contractors agree to the Corporation selling direct to the consumer, and accept half the manufacturer's discount when they have introduced the consumer—a fair arrangement which has been offered to the Electrical

Contractors' Association again and again, and refused (p. 128).

A STORAGE-BATTERY difficulty is explained in our "Questions and Answers" columns (p. 129).

AMONG the subjects of specifications published at the Patent Office last Thursday are a method of D.C. motor control involving slip-rings for A.C. dynamic braking, a lamp lock, and a method of interlocking alternator field switches and main circuit-breakers (p. 130).

A DESCRIPTION is given of the electrical equipment of a large flour mill (p. 131).

A SERIOUS accident due to the bursting of a flywheel occurred at Cardiff on Sunday night (p. 133).

OUR "Trade Section" contains descriptions of some new switches, electro-medical apparatus, and a suction cleaner (pp. 133 and 134).

JUDGMENT has been given in the dispute with regard to electric light carbons, an incident of which was the breaking into the Foster Co.'s works in the small hours of a Sunday morning and the forcible removal of the carbons in question (p. 135).

A 5,000-kw. turbo-alternator and boiler is required at Hull; electric lighting material by the Victoria Railway Commissioners; water-tube boilers at Edinburgh; motor-generators, &c., at Aberdare; a 400-kw. generating set at Bridgend, and telephone material in Greece.—Stores are required in a number of places (p. 135).

A LOAN has been sanctioned at Coventry, but refused at Tunbridge Wells.—It is thought probable that, after all, there need only be a small increase in the charges for current at Dublin.—An increase of 10 per cent. is to be made at Kingston-on-Thames (p. 136).

A MORTGAGE of £10,000 has been arranged with the Sterling Telephone & Electric Co. on behalf of the War Office.—The Treasury has sanctioned an issue of new capital by the Newcastle-on-Tyne Electric Supply Co.—The Brush Company also anticipates obtaining a similar sanction (p. 136).

Arrangements for the Week.—(To-day) Thursday, March 25th.—Institution of Electrical Engineers. "Telephone Troubles in the Tropics," by W. L. Preece. 8 p.m.

Friday, March 26th.—Royal Institution. Evening Discourse. "Experiments in Slow Cathode Rays," by Prof. Sir J. J. Thomson, F.R.S. 9 p.m.

Tuesday, March 30th.—Association of Supervising Engineers, St. Bride Institute, Fleet Street, E.C. "Intercommunication Telephones," by H. C. Lee. 8 p.m.

Wednesday, March 31st.—Institution of Electrical Engineers. Birmingham Section. University. "Development of Main-line Signalling on Railways," by W. C. Ackfield. 7.30 p.m.

Institution of Electrical Engineers. Students' Section. Discussion on "Application of Electrical Engineering to Warfare—Searchlights and Projectors." 7.45 p.m.

THE RESTRICTIONS ON ELECTRICITY WORKS EXTENSIONS

IN our issue of March 11th, we reviewed the position created by the action of the Treasury, through the Local Government Board and London County Council respectively, in refusing to sanction loans for electricity works extensions, unless definitely required for supplying power for the manufacture of munitions of war.

The position has been made more clear by the issue of a letter by the L.G.B., addressed to all Local Authorities, asking that, as far as possible, all new work should be held up until the end of the war; this request was made on the following grounds :—

1. That new work necessitated the employment of additional labour, and therefore involved competition with the State in the labour market. All kinds of labour is now urgently required, either for service in the field or in the production of munitions of war.

2. That on the successful completion of the war and the consequent release from war service of those at present so employed, there would be a large surplus of labour available, and this could then be employed on extension work, and consequently reduce unemployment in the country.

3. That new work necessitated the employment of additional capital, and therefore involved competition with the State in the money market. All available cash resources should at present be conserved for the purpose of a successful prosecution of war.

It is seen, therefore, that extensions are not discouraged merely to avoid the locking-up of capital, but also in order to enable all the labour available (particularly that employed in engineering workshops) for the manufacture of munitions of war. On the other hand, nothing is likely to be placed in the way of extensions required to enable additional electrical power to be supplied by the electricity works to firms engaged on Government work.

Some further cases as to the treatment of applications for sanction to loans are referred to in our "Local Notes" (p. 136).

We have received a large number of letters on the subject :

Belfast.—Mr. T. W. Bloxam writes us: Mr. Hooper settles the question of connecting new consumers to existing plant by putting it upon the engineer of each undertaking to say just how many more consumers he can supply. The best way will be to fix a date, and give notice that no more applications will be entertained after the period has expired. It would be very awkward to refuse any particular application. Undertakings will, as a rule, have sufficient reserve funds for the extensions of mains necessary to provide load to fill up existing plant, but not to pay for plant extensions and mains. Unfortunately there appears to be a more insistent call than usual for trading undertakings to assist the rates, owing to existing circumstances increasing the charges upon them. If normal extensions of mains are stopped, it is obvious the usual number of cable hands must be reduced.

This undertaking was just at the stage when the addition of further consumers was likely to leave insufficient margin of plant. Tenders were about to be invited for additional plant, when it was decided to postpone the extensions. The effect of the war has, however, reduced the demand on the works, so that the postponement is not serious. We are, however, continuing to connect new consumers at such a rate that the question of fixing a date for the limit must arise sooner or later.

Bradford.—Mr. Thomas Roles writes : The Electricity Department is likely to be considerably affected by the decision. Extensions to our generating plant are now in hand, estimated to cost over £80,000; the greater portion of this plant is either delivered or in course of manufacture. I have received intimation that sanction cannot be granted in respect of such portions of the plant included in this scheme, for which orders have not already been placed.

I am expecting permission to raise a loan to cover all work for mains extensions which has received the approval of the City Council. A number of prospective consumers may have to avail themselves of other means of obtaining power and light, either temporarily or permanently. Providing that all the plant at present on order is installed, we expect to be in a fairly comfortable position during the next twelve months, and for a considerably longer period if our consumers assist us by reducing their demands at times of peak load in the event of a serious plant breakdown. I think there is little doubt that the Committee will decide to continue the practice of putting in services and purchasing meters out of revenue, to enable additional consumers to be coupled up on the present distributing mains. The progressive policy adopted for a number of years past in putting down distributing mains where a revenue of 10 per cent. or above could be shown on the capital outlay is likely to bear good fruit under the present circumstances. With

regard to actual mains extensions, if the estimated revenue bears a high proportion to the capital expenditure, the extension may be paid for out of the reserve fund. The number of cases will be limited, however, as this fund has been very heavily drawn upon in connection with plant renewals. Unless money was urgently needed for war purposes, the Treasury would not have issued such a drastic order, and it is our duty to put aside local considerations for the benefit of national interests.

Bury.—Mr. S. J. Watson writes : For the good of the State there is not the slightest doubt that new work should not at present be proceeded with. In several cases, extended borrowing powers have been granted to render additional power available for the production of munitions of war; but we hope that the war will be over before any extension initiated at the present time can be completed, and until all possible existing means of production have been exhausted, I am not at all sure that this policy is a sound one. The cry at the beginning of the war of "Business as Usual" has, in my opinion, had very detrimental results. It has made many manufacturers continue to turn out goods which, in the meanwhile, might very well have been done without, instead of employing their plant and labour for the purpose of the war. Another exceedingly important point is the fact that previous to the war the most of the loans were obtained on the basis of a $3\frac{1}{4}$ per cent. return. Additional money would now have to be raised, probably on a $4\frac{1}{2}$ per cent. basis. If those who are at present receiving $3\frac{1}{2}$ per cent. become fully alive to the fact that corporations are offering $4\frac{1}{2}$ per cent., they will withdraw their money at $3\frac{1}{2}$ per cent. in order to obtain new loans at $4\frac{1}{2}$ per cent., with the result that the interest on practically all outstanding loans would be forced up. A 1 per cent. increase in the interest payable on all the loans of this Corporation would be equal to an increase in the rates of at least 10d. in the £. Mr. Watson then refers to the policy at Bury in connection with the extensions to the Chamber Hall power station, referred to in our "Local Notes" this week. This decision, he continues, involves the necessity to refuse a supply to any additional large consumers, but although it will tend to arrest development, it can have no very serious consequences. We shall continue to connect up small lighting consumers, but all services and meters are now purchased out of revenue. Although many undertakings, including Bury, have fairly large cash resources in the form of a depreciation or reserve fund, such funds are not, as a rule, sufficiently large to finance a large scheme of extension, and in any case, in my view, it is not desirable at present to use such a fund for the purpose. Let the money be invested in War Loan, and so further the general good of the country. The holding-up of any assistance which may have been given to the rates during the last few years is also, in my view, undesirable. The only result would be that the burden at present carried by ratepayers would be still further increased. The profits of gasworks and tramways will, in many cases, be seriously affected, and, provided the electricity department has made the usual or even an increased surplus, it should be applied as usual to the general good.

A number of other letters have been received, which will be published in our next issues, and further correspondence is invited.

LABOUR TROUBLES Strike of L.C.C. Wiremen

ON Saturday, March 13th, the wiremen employed in the rolling stock section of the L.C.C. tramways struck work to have their minimum wages increased from 10d. to 10½d. an hour. The latter pay is the minimum given by the London Electrical Masters' Association to fully qualified wiremen employed on wiring buildings, and is also the rate that has now been paid by the L.C.C. to men engaged on this class of work (see ELECTRICAL ENGINEERING, March 4th, p. 100), but as this rate was only intended to apply to men working on buildings, and not in workshops, the L.C.C. maintained the 10d. an hour for the wiremen on their rolling stock section. The matter has been considered by a Conciliation Board, and has been referred to a Board of Arbitration. Meantime the men are still on strike. The Highways Committee are reporting to the Council on the whole matter on Tuesday.

The wiremen working for electrical contractors have now sent in their application to the London Electrical Masters' Association for increase of pay from 10d. to 1s. an hour. We dealt with this matter in our issue of Feb. 25th (p. 82). Since the resolution then reported the Electrical Trades Union considered it advisable to call another meeting, when the application presented to the London Electrical Masters' Association for one shilling per hour with a forty-eight hour week was ratified, and it was further decided that a special code of working rules for men engaged on ship work should be circulated to all the employers in the Port of London.

We understand that a reply by the Masters' Association is being sent to the Trades Union.

THE CALLENDER-WATERS FEEDER PROTECTIVE SYSTEM

THE latest automatic feeder-protective system is due to Mr. E. G. Waters, working in conjunction with Mr. J. F. Watson, of Callender's Cable & Construction Co., Ltd. It aims at simplicity of construction and arrangement, independence of pilot-wire circuits, and adaptability. Arrangements have already been made for it to be used at Northampton, and it has also been selected for the lighting and signalling circuits of the L. & S.W. Railway (which are at 3,300 volts A.C.), the main traction feeders for which

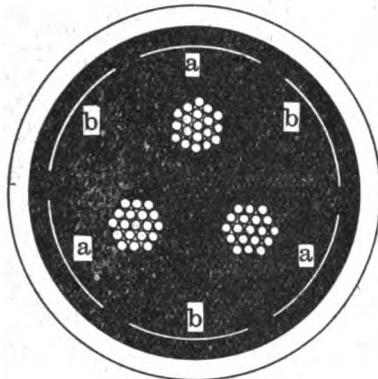

FIG. 1.

are to be protected on the Ferranti-Waters system.* Both systems will thus be given a trial side by side.

The cable used for the Callender-Waters protective system is constructed in the ordinary manner, except that, under the lead sheath, and lightly insulated from it, there are a set of six copper tapes, 0.016 in. thick, put on with a fairly long lay, and not touching one another. The insulation between the adjacent tapes and between the tapes and each is sufficient to withstand 1,000 volts. Fig. 1 indicates the arrangement of the tapes in a cable. In the simplest application of the system, alternate tapes *a* *a* *a* are connected together, and through a relay to earth at one end of the cable, and the tapes *b* *b* *b* are connected together and to earth at the other end. The relay closes the circuit of the tripping coil of the main switch. This is shown diagrammatically in Fig. 2; for simplicity only one main conductor *C* is indicated, and the two sets of tapes and the lead *L* are shown as straight lines. *T* is the tripping coil of the main switch.

If an earth fault appears on the conductor through any cause, say at *F*, contact will be made between the conductor *C*, both tapes, and earth. A circuit will then be made from the conductor *C* through the tape *a* and the relay to earth. This in itself might not be sufficient to actuate the relay, as the circuit is obviously shunted by the direct earth connection to the conductor *C* at the fault; but owing to the tape running parallel to the conductor, a strong current will be induced in it and flow through the circuit, tape *a*,

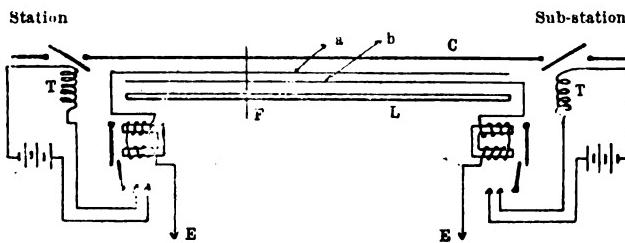

FIG. 2.

relay, earth, and back to tape *a* at the fault, and this is found to be quite sufficient to work the relay. To provide for the contingency of the fault occurring quite near the end of the cable, in which case there would only be a short length for this inductive action to take effect, or if only a comparatively small earth current is allowable before the cable is cut off, some iron is threaded over the part of the cable connecting the metal sheathing to the earth plate or outgoing metal sheathing. This has the effect of increasing the impedance of the sheathing, thus forcing the current through the relay to earth.

The relay at the sub-station end should also be actuated by the circuit made through the tape *b*, and the cable would thus

be disconnected automatically at both ends. There is, however, just a possibility that a fault, say from a blow with a pick, might only connect one tape to earth and not two adjacent ones, in which case the cable would still be left disconnected at one end. To meet this contingency, the connections are modified, in practice, to those shown in Fig. 3, which is the arrangement to be adopted at Northampton and the

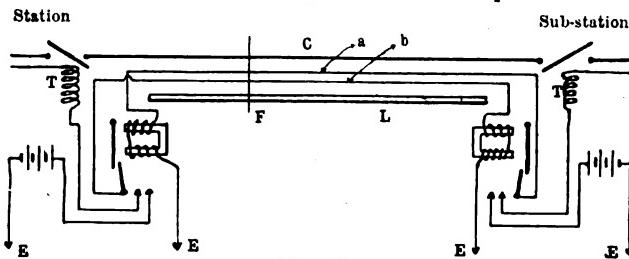

FIG. 3.

L. & S.W. Railway. On tracing these out, it is seen that, as soon as either of the relays operates, besides closing the circuit of the tripping coil of the local switch, it establishes a circuit from the battery, through the unaffected tape and the relay at the other end, and back to the battery through earth. An additional advantage of this, is that there is an electric interlock between the two relays, and the sub-station switch cannot be replaced until the station relay is restored.

The system described is clearly applicable to single or duplicate feeders, and also to interconnectors and ring mains. To protect "swallow-tailed" feeders, a modification is necessary, consisting in connecting the six tapes in three sets of two, instead of two sets of three. The relay is then made with an additional secondary contact for the other set of tapes (connected to the relay at the second sub-station). The operation of any of the three relays will then actuate the other two relays as well.

A further modification has been devised, making the system independent of the induced current in the tape, and also, therefore, making it applicable to a D.C. system, but

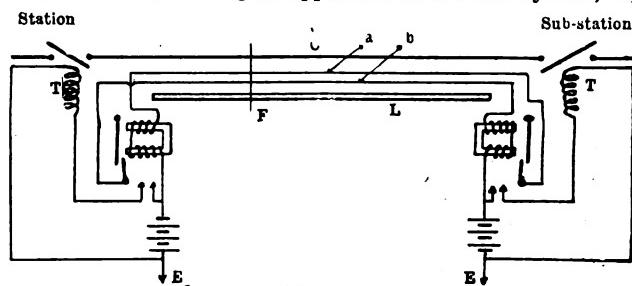

FIG. 4.

an opportunity has not yet arisen for its practical application. The connections are shown in Fig. 4. It is seen that, on connection of either of the two sets of tapes to earth, both relays will be actuated by the batteries; it will also be noticed that these are in opposition, so that while the relays are down the batteries are in opposition and not short-circuited.

We have been privileged to see the Callender-Waters system in operation at Messrs. Callender's works, and were much impressed by its simplicity and quick action.

A Diesel Engine Breakdown.—We have received from the Diesel Engine Users' Association a report by Mr. P. H. Smith on an accident which occurred last September to a Diesel engine at Oxford, when one of the big ends broke up and serious damage was done to other parts of the engine. The accident was traced to fracture of one of the bolts of the big end of the connecting rod, which was of insufficient strength. The stresses in the connecting-rod bolts of various engines have been worked out, and it was seen that the Oxford bolts were stressed much too high. If designed on the lines of a Willans engine, it should have been $\frac{1}{4}$ in. larger, or compared with a Sulzer engine, 1.18 in. larger. Again, the Oxford bolt was of iron, whereas Carels at present, and also Willans, use Siemens-Martin steel, and Sulzer crucible steel. Taking into account the tensile strength of these materials, it would appear that the Oxford bolt had a factor of safety of 7.7, while Willans allow 18 and Sulzer 27. Mr. Smith also goes into the question of the design of the big end, stating that greater stresses are produced in the marine type than when the top brass is contained in a jaw forming an integral part of the connecting rod, as in the Augsburg and Sulzer engines. He recommends that these bolts be replaced after 3,000 hours' working.

* See ELECTRICAL ENGINEERING, June 25th, 1914.

THE RATING OF INCANDESCENT LAMPS

AT the last meeting of the Illuminating Engineering Society, Mr. F. W. Willcox opened a discussion on the practical rating of electric incandescent lamps. He pointed out that in this country, as well as in America, lamps had come to be rated by their input in watts rather than by their output in candle-power, and gave the following among the reasons why it was preferable. Candle-power was in its nature an indefinite and physiological quantity, difficult of measurement, and there was much room for confusion in the difference between the British and German standards, the difference between mean horizontal and mean hemispherical candle-power of a lamp, and the great difference that can be made in its value in different directions by altering the disposition of the filament and adding reflectors. The wattage, however, was definite, easily measured, and did not alter during the life of the lamp as much as the candle-power. It was a more convenient measure for planning installations, estimating costs, &c., and it was easier for the manufacturer to retain his standard watt sizes as the efficiency of the lamps increased than to alter them to fit the old candle-power values. Again, the efficiency of 100-volt and 200-volt metal filament lamps were not quite the same, and it would be inconvenient, as two sets of different voltages would be required to keep the candle-powers in line. The power consumed seemed to the speaker a very natural unit to work on, and only needed to be coupled to the efficiency value to give the luminous output. The efficiency could be measured by matching the colour against standards, and did not necessarily involve candle-power observations. Finally, Mr. Willcox argued that if it was necessary to define the luminous output of a lamp, it was much better expressed in "lumens," or units plus of light, than candle-power, as that gave the total light from the lamp, and was uninfluenced by the disposition of the filament, &c., bearing a constant ratio to the watts for a particular filament temperature. Its use also simplified many illumination calculations, especially in estimating the effect of indirect and semi-indirect lighting.

Mr. Wordingham, who continued the discussion, considered that the watt rating was useless to the consumer and pointed out that the rated candle-power was always understood to be mean horizontal. Prof. S. P. Thompson in a written communication held that lamps should be marked with volts and watts, and, if desired, with approximate mean spherical candle-power, but that for the "ranging of standard magnitudes" specific values of watts should be used. Mr. A. P. Trotter also wrote that he was in favour of watt rating, and his conviction had been strengthened by the use of "downlight" and similar lamps, for none of which horizontal c.p. is suitable. The lumen he regarded as a unit only fit to be handled by experts, and not fit for public use. Several speakers dealt with the parallel problem with gas lamps. Mr. Haydn T. Harrison thought it was absurd to rate light sources in anything but light units; he also preferred candle-power to lumens, and Mr. C. C. Paterson agreed that the primary principle must be that we should try to rate in terms of what the lamp was intended to do. Prof. J. T. Morris and Mr. McIntyre were also strongly in favour of candle-power rating. Mr. J. Y. Fletcher said that manufacturers made no secret of the candle-powers of their lamps and had no great objection to marking it on the lamps if desired, and Mr. Le Marechal considered that although there were some advantages in working in watts, if the public wanted candle-power on the lamps, there was no objection to putting it there. Mr. J. E. Dow and other speakers emphasised the value of polar curves for giving complete information about the output of a lamp.

WOMEN'S WORK IN THE ENGINEERING INDUSTRIES

MISS C. GRIFF, of 52 New Bond Street, W., writes us as "a woman engineer," who has herself been through the orthodox training of workshop apprenticeship, drawing office, and technical college, on the subject of mobilising the women willing to work on war service, as suggested by the Board of Trade. She asks the help of our readers in letting her know in what special work in their factories they are prepared to engage women workers, and whether there is any particular method of training they would desire to fit girls for working for them? Lady tracers and draughtswomen have, of course, been employed to a certain extent for years past, but she wishes to know also what works who have hitherto not employed them will now be willing to do so. She does not wish to add to the numerous existing organisations for women's work, but to assist in the management—under the auspices of one of them—a special branch for training and helping women to work

during the war in the factories directly connected with munitions of war, and other necessary engineering undertakings.

We have made inquiries, and find that there is no organisation which does exactly that which Miss Griff proposes; the Queen's Work for Women Relief Fund, the National Political League, and the Professional Women's Sub-Committee of the Prince of Wales' Fund, all working more or less in conjunction to avoid overlapping, act mainly in the direction of making or finding work for women in distress. On the other hand, we hardly think that there will be much scope for the organisation proposed by Miss Griff, for those firms who can use female workers to take the place of male ones, would doubtless prefer the simpler expedient of first filling the vacancies with those already trained, and if more were required would then advertise for others, select likely applicants, and train them themselves. Moreover, the existing technical classes and schools are for the most part open to women as well as to men, and the fees are not large.

MUNICIPAL SHOWROOMS

Agreement with Contractors in Glasgow

AFTER a conference between a special sub-committee of the Glasgow Electricity Committee and a sub-committee of the Electrical Contractors' Association of Scotland (Glasgow Branch), the following agreement has been arrived at with regard to the proposal by the Electricity Department to establish a showroom in a central portion of the city:—

The proposed showroom would be equipped and managed entirely by the Corporation, on the following lines, for five years from the date of opening:—

That the contractors and their customers shall be afforded all possible facilities for inspecting the stock there.

That any electrical contractor who shall request the Corporation to sell any fittings, accessories, lamps, or apparatus shall be entitled to receive one-half of the discount which he would have received from the makers, had he sold the apparatus direct.

That all fittings, accessories, lamps, and apparatus sold from the showroom shall be at the current list prices of the firms supplying the goods.

That, as far as possible, sales initiated in the showroom shall be completed through the contractor who sent the customer to the showroom.

That all wiring work resulting from inquiries at the showroom shall be done direct by a contractor, and no undue preference shall be shown.

That the hiring of apparatus shall not be undertaken from the showroom, but the showroom management shall be free to lend apparatus for a short period to possible customers under exceptional circumstances, and make a charge for the loan if they think fit.

That all charges made to customers by the showroom management shall be separately stated on the relative demand notes sent to consumers, and all sums paid to and obtained by the Corporation as a result of business done in the showroom shall be separately shown in the annual accounts of the Corporation Electricity Department, which accounts are audited by an independent auditor.

The Electrical Trades Benevolent Institution.—The annual general meeting of the members of this Institution will be held at 6.30 p.m. on Monday, 18th April, at the Institution of Electrical Engineers. Mr. E. Garcke has kindly consented to take the chair.

A Home Office Prosecution.—The Lancashire and Yorkshire Railway Co. were summoned recently at Formby for a breach of the Factory Acts in connection with an accident which took place at their Formby power-house, when a man named Hindley, who was working behind a 7,500 switchboard, received severe burns and injuries. It appears that he had ascended a ladder close to some live connecting-links to measure off a length of cable when, in handing down the cable to another man, he made contact with a live conductor, and was thrown from the ladder and badly burnt. The prosecution contended that the switchboard ought to have been dead before any work was attempted upon it at all, or, if it were necessary to work upon it "alive," it should have been properly and efficiently screened. Screens of a kind were provided at the base portion where the switches were, but no screens suitable or intended to be used for these connecting links were supplied. The railway company's case was that the work to be done had reached a certain stage, and nothing further ought to have been done till midnight, when the board would have been dead. The men in their zeal to get on with the work and in order to make use of the daylight had gone on with the work without having been told to do so. It was admitted, however, that no specific instructions forbidding them to do so had been given. There were no screens for the upper part of the board, as it was never contemplated that it should be worked on when live. The Bench held the company responsible, and imposed a fine of £20 with £20 costs.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

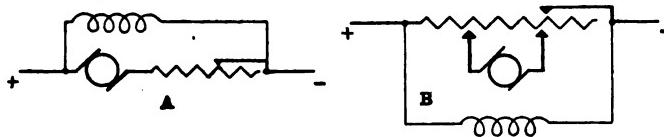

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

QUESTION No. 1,435.

I wish to drive a milling cutter taking $\frac{1}{2}$ h.p. at 30 revs. per min. by means of temporary D.C. 15-h.p. motor which normally runs at 750 revs. Is it possible to reduce the speed of the motor to 30 revs., and will the speed remain fairly constant when the cutter is working, if a resistance is used in series with the

armature (with full excitation) to reduce the speed? I do not want to use reducing gear. Are there any other ways of reducing the speed without altering the motor internally? Would it be better to shunt the armature across a resistance as in diagram "B" instead of series connection as in "A" to give constant speed—"E. W."

(Answers must be received not later than first post Thursday, April 1st.)

ANSWERS TO No. 1,433.

I am in charge of an accumulator battery. One cell gives me plenty of trouble. Its peculiarity is that the specific gravity falls during charging, and recovers during the discharge. The plates are in good condition, and have a clearance of 6 in. between lower edges of plates and bottom of cell, which is a teak lead lined tank. There are no shorts in the cell, and the sediment was taken out to be sure that there was no fouling due to it. The battery is not yet three years old. The sulphuric acid was 1·840° S.G. before mixing with the distilled water, and when mixed the electrolyte was 1·180 S.G. There is also no temperature variation in the battery room during the charge. What is the probable cause of the trouble?—"H. C. P." (Hong Kong).

The first award (10s.) is given to "M. M." for the following reply:—

The cell giving trouble has evidently become reversed in polarity, but the cause of such reversal is difficult, if not impossible, to give with certainty; only suggestions can be offered. We will take for granted that the cell is properly connected to the adjoining cells. This can easily be checked by counting the number of plates, the negatives being one more in number than the positives.

Consider now how a cell could have its polarity reversed. Suppose a pellet of paste short-circuited the plates, or, again, some substance from outside might lodge across the plate and run the cell down. If this occurred during "charge," this particular cell would be practically cut out; therefore the specific gravity of its acid solution would remain at about 1·180. If we further suppose that by some means this bridging substance became dislodged, then when battery was "discharging," the current passing through the cell would change its polarity. The "short," as above suggested, would mean some time before cell was in good condition again. This is evident when we remember that in charge and in discharge there is not a very great difference in the ampere-hours.

The method of procedure would be to see that the cell is clean and free from deposit and that the plates are well separated; also that there is not a loose plate nor loose paste. Another point is to make sure that the plates are clear from the lead lining of containing vessel. For several discharges cut this cell out, cutting it in again for the charge; this will soon put matters right.

It is the passage of the current through a cell that, when charging, raises the specific gravity of the acid solution by the "withdrawal" of water. Oxygen goes to the positive and hydrogen to the negative plate. The polarity of a secondary cell

is not a fixed quality, but is determined by the direction of the flow of the charging current. A cell, therefore, that is without a charge has its polarity altered by the general discharge current flowing through the battery. A cell under such conditions would have the specific gravity of its acid solution increased, although that of the other cells of the battery was decreased. The voltmeter should not only give the actual potential of a cell, but also indicate its polarity. Also the dark red colour of positive plates usually makes polarity at once obvious.

The second award (5s.) is made to "L. R." who writes as follows:—

The exact cause of the difficulty mentioned cannot readily be determined because the fault may be due to one or two matters. Quite likely, as the cell has been giving trouble at some course of its existence, it has been reversed probably by continuing discharge through the whole battery after the E.M.F. of that particular cell has dropped to zero. In this case the plates ultimately would look quite healthy, because in a subsequent charging and discharging as regards their surface they would obtain the right colour, but internally the composition would not be correct. In these circumstances they would to some extent behave like plates which have not been completely formed, and it is well known in practice that with such plates there is a drop of specific gravity of the electrolyte during charge. The reason is not fully understood, but it is probably due to a chemical action which goes on within the plate itself. It may be that the plates were not properly charged in the first place after receipt. A large amount of lead sulphate is usually put into the plates, especially for transit abroad, because the paste holds better in this way. In these circumstances they should be very fully charged on arrival, and if the original charge is not complete the ultimate composition of the plate is very much a matter of doubt. It takes 300 to 400 hours charging and discharging properly, before the plates are fully formed and the specific gravity of the electrolyte becomes thoroughly stable.

Another possibility is that the plates, either through their construction or subsequent treatment, have become unduly hard and diffusion of electrolyte is slow. This will result in slow increase of density within the plate during charging, the strong acid there formed not diffusing out until discharge takes place, where it ultimately raises the specific gravity of the rest of the electrolyte so that the total gravity is increased on discharge. The reverse action occurs in charging. This is particularly noticeable if charging and discharging are effected rapidly, and there is little time left between.

The history of the cell should be examined from both the above points of view. In addition, it should be made certain that there is no local short-circuit formed by dropping particles, because this tending to reduce the E.M.F., and, therefore, to effect reversal, will contribute to the first-mentioned cause. It is not likely that impurities in the acid give rise to the faults suggested, because presumably the same acid has been used in all the cells. It is suggested that the cell in question should be fully charged with the others, allowed to stand for some little time, then the density taken and the acid adjusted to the correct strength. It might then be worked less heavily than the rest of the battery, but should be given full and very careful charges, when the difficulties found will probably disappear. Matters will most likely be assisted if 1 per cent. of sodium sulphate be used with the electrolyte, particularly if the battery has suffered previous reversal.

QUESTION No. 1,429.

"M. J. L." asks me, in your issue of March 11th, why I assumed that the rotor voltage on open-circuit of a 20-h.p. 550-volt three-phase motor would be approximately 200 volts. I have pleasure in replying as follows:—When designing a rotor, two of the main points to be kept in view are safety and cheapness, and for small motors, when the stator pressure is not very high, it is found that the most economical design gives a slip-ring pressure on open circuit, i.e., when the motor is standing still, of from 150 to 250 volts.

In large H.T. induction motors, the rotor E.M.F. is designed to be 400 to 500 volts or even higher at starting, in order to avoid large currents necessitating heavy rotor windings, massive slip-rings, brush gear, &c. "M. J. L." is correct in stating, "with the rotor standing still . . . the cutting of the lines of force would now be at the greatest rate," but when the rotor is standing still the motor may be regarded as an ordinary transformer, although, of course, a very inefficient one, due to the air-gap and to the fact that primary and secondary windings do not interlink, and the open-circuit voltage between the slip-rings will depend on the stator voltage and on the ratio of stator to rotor windings. Generally speaking, where both stator and rotor windings are similarly connected:—

Open-circuit slip-ring voltage =

$$\text{Stator volts} \times \frac{\text{No. of rotor turns in series per phase}}{\text{No. of stator turns in series per phase}}$$

With regard to the rotor currents, these may be fairly high without requiring high rotor E.M.F.'s, as the resistance of a rotor is usually a fraction of an ohm, and the external resistance will only be a few ohms. I trust this explanation will clear up any points "M. J. L." may be in doubt about regarding rotor E.M.F.'s and currents.

"C. S. B."

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 18th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

4,554/14. **Motor Control.** B.T.-H. Co. (*G.E. Co., U.S.A.*). A system of motor control in which dynamic braking of a D.C. motor is effected by allowing the armature to generate alternating current in a special circuit from slip-rings provided in addition to the commutator, while the fields are separately excited. (Three figures.)

4,934/14. **Strip Lighting.** C. C. REGNART. A system of strip lighting by tubular straight filament lamps with terminals at each end. The lamps are arranged to be very close together by the use of cup-shaped terminals sunk into the glass. (Three figures.)

4,964/14. **Lamp Locks.** J. A. VICE. A thin metal sleeve over the lamp cap with hole for the pins to project through has an angular cut in it so that a part of it can be turned up to form a springy ratchet tooth which engages the slot in the holder when the lamp is in place, and prevents it being turned back for removal. A special tool has to be used to cut away this tooth to withdraw the lamp. (Five figures.)

5,455/14. **Protective Apparatus.** B.T.-H. Co. and E. B. WEDMORE. A protective device for alternators comprising a field switch arranged to be tripped only when the relay controlling the main circuit-breaker has acted and movement of the main switch has actually commenced. (Two figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

DYNAMOS, MOTORS, AND TRANSFORMERS: HOLM-HANSEN [Transformers] 5,511/14.

Incandescent Lamps: OWEN and DAMEY [Incandescent lamps] 6,853/14.

Instruments and Meters: MILNE, GEORGE, LEVY and TUCKER [Electrical measurement] 26,929/13.

Switchgear, Fuses, and Fittings: B.T.-H. Co. (*G. E. C., U.S.A.*) [Switches] 2,089/14; CHALIER [Lamp-holders and reflectors] 4,627/14; SANTOSTEFANO DELLA CERDA [Luminous switches] 10,733/14; WORSNUP [Switches] 19,122/14.

Telephony and Telegraphy: SMITH [Signalling] 6,668/14; GOLD-

SCHMIDT [Wireless selector] 14,595/14; OLSSON and PLEIJEL [Loading coils] 22,270/14.

Traction: WARTHEN [Train-control system] 5,351/14.

Miscellaneous: KLAHN [Gyroscopic compasses] 29,010/13; WEST [Battery cases for motor-cycles] 4,470/14; CADENEL [Electrically-controlled locks] 5,354/14; J. P. HALL & Co. and NIELD [Electric brakes, clutches, &c.] 5,583/14; BURNSIDE and WALLACE [Condensers] 5,583/14; COLLIE [Fans] 6,867/14; GILES [Condensers] 11,404/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

DYNAMOS, MOTOR TRANSFORMERS, &c.: LAMME [Polyphase motor control] 2,329/15; TORNER [Transformers] 2,786/15.

Switchgear, &c.: OTTINETTI [Push-button switches] 2,787/15.

TELEGRAPHY AND TELEPHONY: GIRARDEAU [Spark gaps] 15,031/15.

Traction: CONNET and ANR. [Vehicle lighting] 3,014/15.

Miscellaneous: HEINSOHN [Welding] 2,248/15.

Expired Patents

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: A. J. PETERSSON [Producing arcs] 25,287/05; BECK FLAME ARC LAMP CO. (*Deutsche Beck Bogenlampen Ges.*) [Flame arc lamps] 26,420/07; G. JOBSON [Reflectors for arc lamps] 28,358/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: R. P. JACKSON [Protective system] 26,120/08.

DYNAMOS, MOTORS, AND TRANSFORMERS: C. E. L. BROWN [Turbo-alternator field magnets] 24,632/01; LANCASHIRE DYNAMO CO. and MOTOR CO. and R. S. MCLEOD [Frequency changers] 26,198/08.

Electrochemistry and Electrometallurgy: C. BINGHAM [Electric furnaces] 26,356/08; P. BUNET and A. BADIN [Electric furnaces] 26,225/09.

Heating and Cooking: M. MARZETTI [Water heaters and coffee pots] 28,480/09.

Miscellaneous: R. C. SMITH [Electric lifts] 26,165/03; R. MAROT [Germicide apparatus] 14,372/04; T. H. PARSONS and A. E. J. BALL [Relay switches for clocks] 27,445/06; SHIP CLEANING CO. and W. R. MACDONALD [Electro-magnetic ship cleaner] 26,441/07; A. A. C. GESE [Electric cranes] 28,367/09.

vehicles, the Committee have decided to recommend, as standard for electric vehicles, the lamps of the size and voltage recommended by the Engineering Standards Committee. These lamps are for a pressure of 12 volts, and the Committee recommend that, for the present, they be coupled across such a number of cells as will give the required voltage, and that a special extra terminal be provided on the cells for this purpose. The Secretary was directed to write to those London municipal and company undertakings charging more than 1d. per unit for "off peak" supply, expressing the hope that they will reconsider this matter and come into line with the large number of supply undertakings which have already adopted the Committee's Standard Tariff.

Induction Generators.—A paper on this subject by Mr. W. H. Date was read at a meeting of the Students' Section of the Institution of Electrical Engineers on March 17th. The author described such a machine as an induction motor mechanically driven above synchronism, and explained that its terminals must be connected to a circuit of definite frequency, as it is not self-acting. In some railways induction motors acting in this way were used for regenerative braking on down grades, and he suggested that the practice might be extended over a greater range of speed by pole-changing switches. Various experiments with induction generators were described, and it was remarked that ordinary alternators when fitted with amortisseurs could act as induction generators when the excitation was accidentally removed, and could continue to run in parallel without damage. The phase relations of the current were discussed, and it was shown how induction generators had advantages over synchronous machines in absence of synchronising and limiting difficulties. Their construction was also more robust, and they were particularly suitable to turbine speeds. The author suggested that a station equipped with these machines running in parallel with synchronous motors would be cheaper to instal and would possess considerable advantages over a station employing synchronous generators.

ELECTRIC TRACTION NOTES

On the suggestion of Sir John Snell, who has been advising the Corporation concerning the proposed purchase of the Bristol Tramways and Carriage Co., independent valuations are to be obtained from Mr. C. P. Sparks, Mr. Peter Addie, City Surveyor, and Mr. L. S. McKenzie, City Engineer.

The Aberdeen Corporation has decided to abandon the "pay-as-you-enter" tramcar system.

The accounts of the Metropolitan Electric Tramways, Ltd., and the London United Tramways, Ltd., for 1914, both show considerable reductions in traffic receipts, the figures being £8,510 and £11,658 respectively. Consequently, the Metropolitan Electric Tramways Co. pay an ordinary dividend of 2 per cent. compared with 3 per cent. last year, and the London United Tramways Co. ½ per cent. on the preference shares as against 1 per cent. last year.

The Electric Vehicle Committee.—At a recent meeting it was decided to make the main feature of the June issue of *The Electric Vehicle* "The Municipal Uses of Electric Vehicles." A slight increase in the demand for Publicity Mail Cards was reported. As we have already announced, the General Electric Co. has been appointed the official manufacturer of charging station signs for twelve months from April 1st for the illuminated type of sign. The Patent Enamel Co., of Selly Oak, Birmingham, has been appointed the official manufacturer for the same period for the enamel plate type of sign. As to the standardisation of metal filament lamps for use on electric

AN ELECTRICALLY DRIVEN FLOUR MILL

THE drive of a flour mill presents certain special features. In the grinding department, which requires most power, the different machines are so proportioned that the whole mill operates as one huge machine with a continuous process of manufacture, and complete interdependence exists between

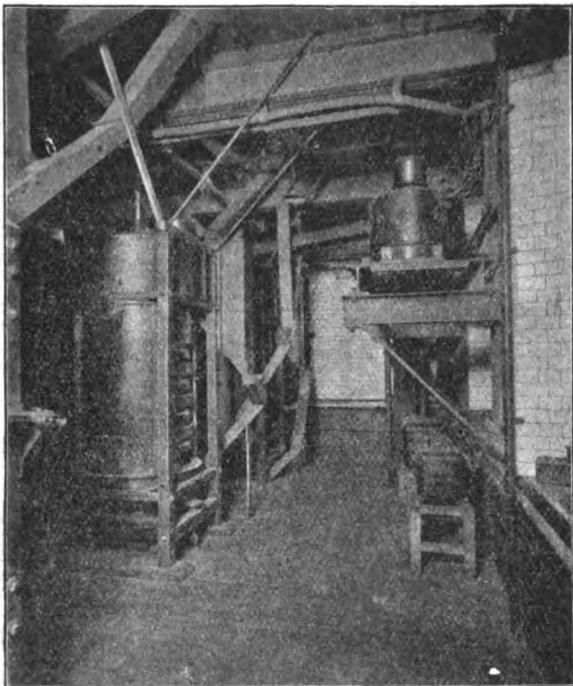

FIG. 1.—GRAIN SCRUBBING MACHINE DRIVEN BY
10 H.P. MOTOR.

the various sections. In other portions of the mill many machines are more widely separated and intermittent in operation. Owing to the big capital outlay in machinery and the relatively small amount of labour required, it is a frequent practice to run mills night and day with a break only at the week end, with the result that the demand for power is uniform, and lasts for long and uninterrupted periods. A vital consideration is that the quality of the product is very susceptible to variation in treatment, which includes, as an important factor, regularity of speed. This

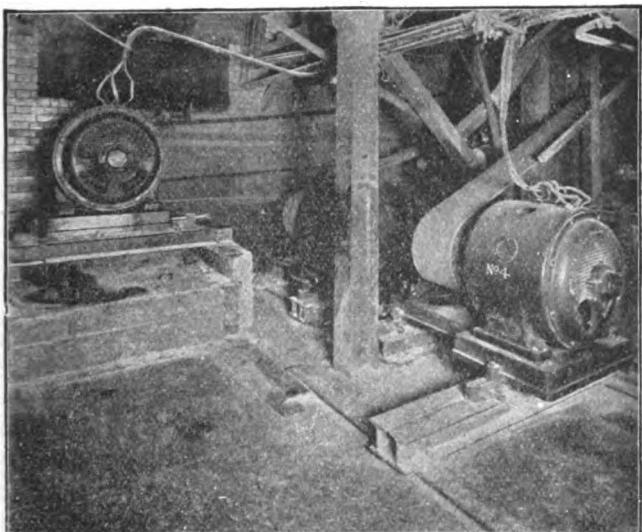

FIG. 2.—40 H.P. MOTOR DRIVING LINE SHAFT
FOR ROLLER MILLS.

constancy of speed is a virtue of the electric drive which is usually appreciated by millers, but in addition there are other material advantages. The light is almost invariably electric, as an open light is impossible owing to the explosive nature of the flour dust, and the elevators and intake plant are

usually driven electrically, so that an electrical installation of some kind must be laid down. Again, electric drive permits of a much more convenient arrangement of the machinery, as it need not all cluster round the line shafting. The ease with which the actual power taken can be measured at any time also greatly facilitates the detection of blunt rolls. Lastly, with the constancy of speed obtainable with electric driving, an increased output of at least 2½ per cent. is available, and the better quality of the product commands a higher price.

An example of a large flour mill converted to electric drive is the Silvertown Flour Mill of the Co-operative Wholesale Society, Ltd. This mill has been electrically equipped by the General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.). It was originally driven by three steam engines, but following the success of the electrically-driven flour mills of the same company at Newcastle, arrangements were made for the supply of power by the West Ham Corporation, who installed a pair of two-phase oil-insulated transformers, and equipped a sub-station

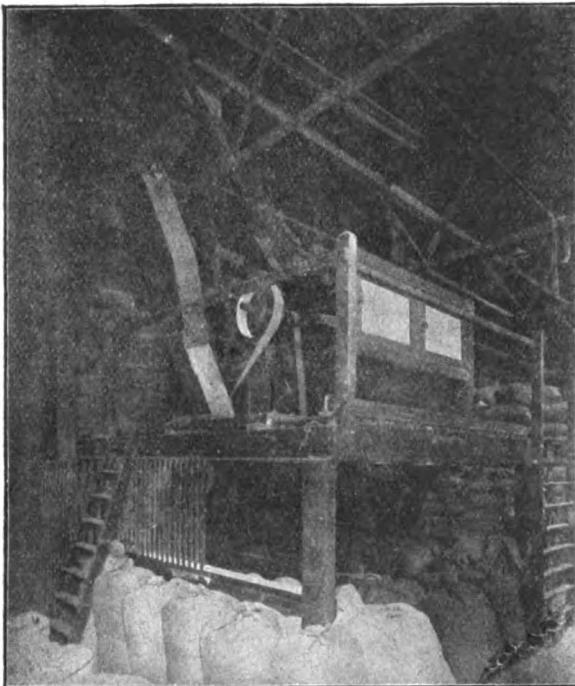

FIG. 3.—20 H.P. MOTOR DRIVING A BRAN DUSTING MACHINE
AND A SACK PACKER.

from which power is delivered to the main "Witton" switchboard of the mill at 400 volts. As the power consumption to about 1,000 h.p. continuously from Monday morning to Saturday noon, this mill is one of the best customers of the Corporation. Electric lighting by Osram lamps is used exclusively, and it may be noted that there is a reduction in fire insurance premiums for flour mills which are lighted electrically. The drive throughout is by two-phase semi-enclosed squirrel-cage Witton motors, and oil-immersed auto-starters are used for all motors over about 5 h.p. Many of the motors had to be put in somewhat inaccessible corners, but the control system in the mill has been centralised, so that many of them are started from the ground floor. In connection with the operation of the starters there is a system of electric bells throughout the mills, so that by pre-arranged signal those in charge of the different floors indicate to the charge man on the ground floor when the motors are to be started or stopped.

Practically all the grain arrives by boat, and the cargoes are discharged by two elevators, driven by 12 h.p. "Witton" motors, and each of a capacity of 40 tons per hour. The grain is weighed as it comes from the elevators, and is carried by band conveyors and bucket elevators to the distributing bands at the top of the silo house, which consists of eight cylindrical chambers of ferro-concrete, having a total capacity of 20,000 quarters of wheat. The grain is transferred as required by other conveyors and elevators to the cleaning house. Here the coarse impurities and light grains are removed by sifting and exhaust fans, and foreign seeds are separated. After a thorough scouring the grain is passed through a washing machine, which also removes the stones. A centrifugal dryer removes practically all the surplus water, after which the clean grain is dried

in a stream of warm air propelled by exhaust fans. The grain is allowed to cool, and is then scrubbed in a vertical brush machine shown in Fig. 1, of which there are three, each driven by a 10 h.p. vertical motor. The wheat is first broken in Robinson grooved roller mills on the ground floor, group driven from line shafts driven by the motors in the basement, illustrated in Fig. 2. The product of the breaking rollers is elevated to the top floor, where it is sifted into various sized grades by machines fitted with vibrating silk sieves and known as "plansifters." The motors driving the elevators and the exhaust fans, by which the dust is carried away, are at the top of the building. The separated constituents from the plansifters descend by shoots to the next floor, where exhaust fans separate and carry away the lighter particles of bran—that is husk—to which no flour adheres. On the floor below and the ground floor the products are ground to increasing fineness, being carried up to the machinery mentioned above to go through the cycle of sifting and purifying after each reduction, until all the flour is extracted, and the residue is only suitable for animal food.

There are several isolated machines for mixing, sack filling, handling, &c., driven by separate motors. Fig. 3, taken in the bran house, shows, for example, a bran dusting machine driven by a 20 h.p. "Witton" motor, with a small sack packer by its side. The old engine-house has been put to use in housing mill stones used in the production of whole meal and the reduction of "middlings" to make animal food.

We understand that the steady drive following this electrification has resulted in a greater uniformity of the flour, and that, among other advantages and conveniences, weekend work on plant for maintenance has become of rare occurrence. The mill, which has a capacity of 50 sacks of flour per hour, is now one of the best equipped in the country. Acknowledgments are due to Mr. Chapman, the manager of the mills, for permission to publish these details.

SERIOUS FLYWHEEL ACCIDENT AT CARDIFF

A SERIOUS accident, causing damage estimated at £20,000, occurred on Sunday night in the Roath Electricity Works at Cardiff, when a flywheel weighing some seventy tons burst and wrecked the generator to which it was attached. A piece of the rim, weighing half a ton, crashed into the boiler-house and smashed into a boiler which was, fortunately, not under steam at the time. The tramway service was suspended throughout Monday, but largely due to the battery at the Hayes station, the greater part of the lighting load was maintained. Fortunately, there was no loss of life nor injury to persons. From the account given at the special meeting of the Tramways and Electric Lighting Committee on Monday, it appears that the main cause of the continuance of the shut-down of the station is the damage to the circulating water pipes. Mr. A. Ellis (Manager and Engineer to the Electricity Department) stated that the large engine was damaged to an extent that it would not pay to repair, but the engine opposite was not so seriously damaged. The most serious difficulty was the breaking open of the 20-in. circulating pipes, which has flooded the engine-room and affected the foundations. A considerable amount of concrete had also been broken up by the bombardment of pieces of the flywheel. New pipes were being supplied by the waterworks department. Four old engines in the adjoining engine-room had been put to work, and some load was taken meanwhile by the Hayes battery. The cause of the running away of the engine remains unexplained. The engine had just been put on load, and suddenly began to accelerate at such an alarming rate that the driver, who was unable to check it, warned everyone to stand clear. Structural repairs are being proceeded with.

"ELECTRICAL ENGINEERING" TRADE SECTION

THE WORKS OF BRUCE PEEBLES & CO.

A N interesting booklet from Bruce Peebles & Co., describing their works and some of their products, gives a very good idea of the extent of their manufacturing facilities, the admirable arrangement of their works, and the range of electrical plant turned out. Situated at East Pilton, not far from Edinburgh, almost on the banks of the Firth of Forth, and linked up by sidings with the Caledonian Railway, the works, with its offices adjoining, its own water supply, sewage plant, and power equipment is entirely self-contained. The main shop is 600 ft. long by 150 ft. wide, divided into five bays, and provided with side galleries. The centre or main bay, as is usual in such works, is devoted to large machine tools and heavy erecting work, while the lighter tools and operations find accommodation in the side bays and galleries. Light railway lines run right through, and the general arrangement is such that, as far as possible, the work travels in one direction as it progresses, from the entry of raw material at one end to the packing and despatch departments at the other. The power-house contains two steam-driven Peebles D.C. machines, one for 500 kw. and one for 250 kw., and power is distributed about the works on a three-wire system with 500 volts across the outers. A storage battery permits of a certain amount of power being taken, and the lighting being maintained when the generating plant is not running. A gas-producer plant is also provided, for supplying drying ovens, annealing stores, &c. There is also a compressed-air service and a system of fire pumps.

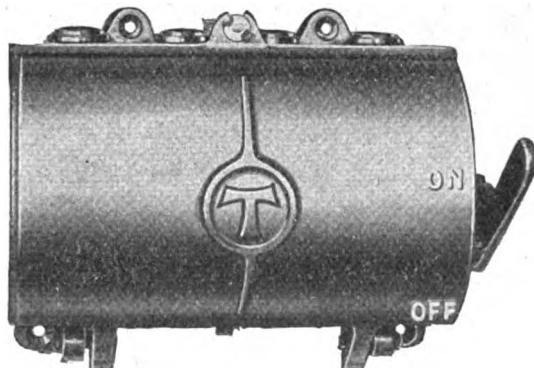

The special departments in the side bays and galleries include a core-plate stamping and notching department, the commutator-building section, the all-important tool-room, a light-machine shop, &c., and the whole of one end of the west bay is occupied by the winding department, adjoining which is the varnishing room, with its drying ovens, vacuum-impregnating tanks, &c. Further departments are another machine bay, a light erecting shop, and a mica-insulation room. In other parts of the works are the pattern shop and foundry, and an interesting feature of the latter is the way in which the end rings of squirrel-cage rotors are cast on from a special alloy. An important part of the establishment is the fully-equipped testing department.

The machinery manufactured comprises A.C. and D.C. motors, dynamos and alternators of every kind, including

turbo-generators, and many interesting features are involved in the company's special designs. The firm is particularly famous as being the manufacturers of the Peebles' motor-converter (Peebles la Cour patents), the special advantages of which are now too well known to need insisting upon here. The booklet to which we have referred is excellently illustrated, with views of the works and numerous representations of typical Bruce Peebles plant, and those interested in such things cannot do better than ask for a copy and see for themselves the high position occupied by this entirely British firm of manufacturers of electrical plant.

A NEW IRONCLAD SWITCH

A DESIGN of ironclad switch intended for conditions where a first-class job is necessary, but price is a vital consideration, has been put on the market by J. H. Tucker & Co. (King's Road, Hay Mills, Birmingham). A usual feature in low-priced ironclad switches has been a slot for the working of the handle in the centre of the cover with

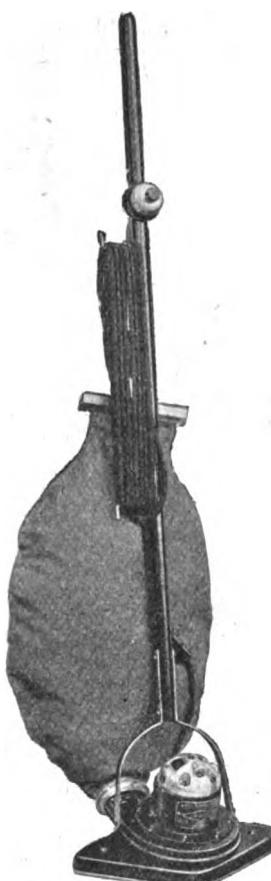

TUCKER D.P. IRONCLAD SWITCH.

attendant difficulty in earthing the handle. This switch, while costing no more than the slotted type, has the handle at one side in the D.P. pattern, and of the stirrup design in the triple pole pattern, so that the handle is in permanent and certain contact with the case for earthing purposes. Each

pole is mounted on a separate vitreous china base, the cover is interlocked with the handle, and the position of the switch is indicated on the cover. A substantial earthing terminal is provided, and the cases are enamelled and stoved to a high-class finish. The wiring facilities and other details have received great care, and these switches, which are at present ready in the 30- and 50-ampere sizes, are remarkably good value for the money.

AN ELECTRIC SUCTION CLEANER

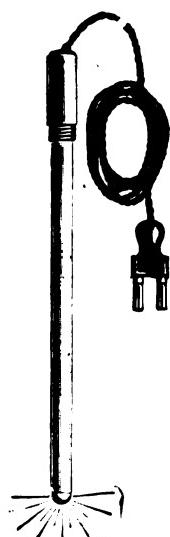

THE BRILLIANT SUCTION CLEANER.

SIMPLEX Conduits, Limited, have just placed on the market the "Brilliant" electric suction cleaner, which is of the self-contained type, as shown in the illustration. In this, special attention has been given to the mechanical and electrical design of the high-speed motor with which the cleaner is fitted, and also to the conformation of the fan blades, which are of cast aluminium. These two parts are largely responsible for the very high efficiency of the apparatus, and for the high degree of suction which it creates. The diamond-shaped shoe is a patented feature of the machine, and this shoe is fitted with castors, which allow the machine to run very easily over carpets and rugs, and at all times to suck in the air regardless of the thickness of the carpet. The shoe is also fitted with a revolving brush, which is capable of picking up threads, &c. This cleaner is fully described in an attractive leaflet which the company have issued, and contractors and electrical dealers can obtain supplies of this leaflet overprinted with their name and address on request. The apparatus retails at five guineas, and is, we believe, the cheapest electrical suction cleaner on the market.

ELECTRO-MEDICAL APPARATUS

THE importance of electro-medical treatment of various kinds is now so firmly established that such a well-arranged price-list as the new ninth edition of that issued by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.) is to be welcomed. The first part is devoted to induction coils complete, with or without the necessary batteries, and a great variety of special electrodes for use with these are listed. Apparatus for electrolysis, or destruction treatment of tissue by small continuous current, and depilation or removal of superfluous hairs, as well as cautery knives, are completely represented. Another useful appliance is the "eye magnet," for withdrawing ferromagnetic particles from the eye. For use in this case and others by ophthalmic surgeons, as well as by dental surgeons and doctors, special kinds of lighting equipment are necessary. Numbers of ingenious designs of these are contained in the list under review. We illustrate here a dental lamp. This is stated to be the smallest manufactured. It is made entirely of glass, and can be sterilised after each operation. Batteries naturally form a feature of the list, and those represented include the Leclanché, Carsak, Edison-Lalande, and bichromate types, as well as portable accumulators. Other apparatus includes delicate measuring instruments, switches and selectors, while at the end of the list are to be found parti-

GLASS DENTAL LAMP.

includes delicate measuring instruments, switches and

selectors of the "Kingsway" massage vibrator, the "Kingsway" hair dryer, Ozone apparatus, battery fans, battery lighting sets and accessories, various novelties, and a full range of electric tattooing apparatus, of English make.

THE MARVEL SWITCH

A S many of our readers who have studied the fascinating subject of modern electric light switching will know this is the name given by A. P. Lundberg & Sons (477 to 489 Liverpool Road, N.) to a special switch that they have developed to effect a variety of modifications of lamp control. The switch resembles externally the ordinary tumbler switch, but has five or sometimes six terminals and fixed contacts, while a number of moving contact studs are mounted on an insulating piece of half-moon shape, to the top of which the metal switch rocker is fixed. The chief feature of the switch is that it has three positions, up, down, and straight out, although there is only one control spring. The connections between the moving contact studs can be easily varied, so that switches of this class can be arranged for a vast variety of different uses, and when two slightly differently arranged are employed together, one acting as an intermediate switch, a vast number of possibilities of control are opened up. The switch, in the various forms in which it is made and its manifold uses, are described in a new leaflet from the manufacturers, which is a revelation of the state of perfection the art of switching has been brought.

DISPUTE re OWNERSHIP OF CARBONS

A SEQUEL to police court proceedings last August, when some men were accused of stealing £2,000 worth of carbons from the works of the Foster Engineering Co., was heard at the Law Courts on Wednesday before Mr. Justice Eve. It appears that the carbons in question were really the property of the German firm of Conradty, whose agents are, or were, the Sloan Electrical Co. Under an agreement between Conradty and the Beck Engineering Co., made in May, 1912, the Conradty Co. was to supply carbons as required to the Beck Co. at market prices, and to keep a sufficient stock in London. At first this stock was kept at the Beck Co.'s works at Hayes, but on the Foster Co. taking over the manufacture of the Beck lamp, the stock was transferred to the latter Co.'s works in Wimbledon. It appears, however, that the licence to manufacture the Beck lamp was subsequently retransferred to the Beck Co., but the Foster Co. refused to agree to transfer the stock of carbons to them, as, by the agreement, the consent of Conradty was necessary. As this was not obtainable last August, the Beck Co. took the law—or their version of it, at any rate—into their own hands, and removed the carbons from the Foster works forcibly in the early hours of a Sunday morning. An order was subsequently made for the carbons to be restored to the Foster Co., pending the hearing of the case. This case was now to decide whether the Beck Co. had a right to the carbons at the prices current before the war. The judge decided that this was not so, and that the carbons, if required, must be invoiced to them at present ruling prices by the Sloan Electrical Co. A counter-claim for damage done to the carbons by the forcible removal was not successful.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Aberdare.—Motor-generators or converters; H.T. switchboard, L.T. panels, and H.T. feeder pillar. Borough Electrical Engineer. April 6th.

Australia.—The Victorian Railway Commissioners require electric lighting material for the car repair shops at Jolimont, including cables, switches, lampholders, &c. Railway Offices, Spencer Street, Melbourne. Further particulars at 73 Basinghall Street, E.C. April 28th.

Bedford.—Owing to the failure of one of the turbines last week, certain of the cables have been so severely strained as to necessitate renewal. An expenditure of £700 is contemplated in this connection.

Blackrock.—The Council has applied for a loan in connection with its electric lighting scheme, but the L.G.B. require to be furnished with the Engineer's specifications before proceeding further.

Bridgend.—A 400 kw. generating set. Borough Electrical Engineer. April 8th.

Brighton.—Surface condenser for Southwick power station. Chief Electrical Engineer, April 12th. (See an advertisement on another page.)

Edinburgh.—Water-tube boilers are required by the Corporation. City Electrical Engineer. April 12th.

Grays.—A L.G.B. inquiry was held last week concerning a loan of £600 for electrical purposes.

Hull.—In consequence of the Treasury restrictions upon capital expenditure and a suggestion made by the L.G.B., the scheme for extensions is to be cut down to a 5,000 kw. turbo-alternator and a boiler, reducing the capital expenditure from £41,500 to £26,445. The loan is not to exceed £20,000, any balance to be met out of the reserve fund.

Wiring

Cowdenbeath.—New school in Barclay Street. Borough Surveyor. March 31st.

Edinburgh.—New Western District Sorting Office. H.M. Office of Works, Storey's Gate, London, S.W.

Glasgow.—Electric lighting of Shakespeare School, Maryhill. Clerk, 129 Bath Street.

London: L.C.C.—265 lighting points at Derington Road School, Lower Tooting. Clerk to Council. March 31st.

Islington.—The Guardians have appointed Mr. W. C. C. Hawayne as their Consulting Engineer, but the scheme is not to be proceeded with for six months.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Accrington.—Cinematograph theatre. R. Stewart, Manchester Road.

Barnstaple.—Technical Institute (£10,000).

Salisbury.—Memorial Hall. Architects, John Harding & Son, 58 High Street.

Torquay.—Technical Institute (£10,000).

Walsall.—Considerable additions to Union premises. Clerk.

Miscellaneous

Australia.—The Victorian Railway Commissioners require two electrically-driven trucks capable of dealing with a load of 4,000 lbs. each. Railway Offices, Spencer Street, Melbourne. Further particulars at 73 Basinghall Street, E.C. April 28th.

Bray.—Twelve months' supply of electrical stores. Borough Electrical Engineer. April 6th.

Greece.—A central exchange and telephone system is required at Salonica; a central exchange at Athens; and a general supply of telephone apparatus and accessories. Further particulars at 73 Basinghall Street, E.C.

Harrogate.—Twelve months' supply of electrical fittings and sundries for Wells and Baths Department. General Manager. March 29th.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Aberdare.—A contract for a twelve months' supply of Wotan, half-watt, and carbon filament lamps has been placed with Siemens Bros. Dynamo Works, Ltd.

Coventry.—An order has been placed with Messrs. E. Dennis & Co. for eight chain grate stokers for B. & W. boilers.

Manchester.—An order has been placed with Messrs. E. Dennis & Co. for the re-linking of two pairs of chain grates of another make, with the "Dennis" patent chain grate link, at the Bloom Street power house.

London: L.C.C.—An order for a twelve months' supply of carbon filament lamps has been placed with Siemens Bros. Dynamo Works, Ltd.

The Highways Committee reports that all the tenders for two 8,000 kw. turbo-generators for Greenwich were submitted subject to the Institution of Electrical Engineers' model conditions of contract. These, however, differ in many respects from the Council's standard conditions, and, as a consequence, arrangements have been made with the British Westinghouse Co., the successful tenderer (£62,003), with a view to certain modifications of the Institution contract conditions, in order to bring them as far as possible into line with the

Council's standard conditions. These chiefly relate to the payments.

Bermondsey.—The tender of Venner & Co. for a twelve months' supply of Chamberlain & Hookham meters and time switches has been accepted.

APPOINTMENTS AND PERSONAL NOTES

Lieut. Harry Byng, third son of the late Mr. Gustav Byng (founder and late chairman of the General Electric Co., Ltd.), was married very quietly on Monday at St. Mary's, Bryanston Square, to Miss Evelyn Curtis, of Boston, U.S.A. Lieut. Byng, who is in the Border Regiment, had only just returned from the Front on five days' leave, and is now on his way to the Front again.

The supplement to the *London Gazette* for March 17th announces that Second Lieut. H. Clifford Palmer has been appointed Captain (temporary) in the London Scottish. The appointment dates from March 4th. We are very glad to hear that the well-known manager of the Publication Department of the General Electric Co., Ltd., has recovered from the effects of his recent operation, and is able once again to take a part in the defence of his country.

The salary of Mr. F. C. Pedley, Borough Electrical Engineer at Bingley, is to be increased by £30 per annum, and that of the Assistant Electrical Engineer by £26 per annum.

A meter tester is required at Barrow-in-Furness (45s.); switchboard attendant at Blackburn (40s.); and two shift engineers at Brighton (30s.). (See advertisements on another page.)

An assistant is required in the Sheffield Electricity Department. £88 per annum. General Manager.

Switchboard attendants are required at Stretford, Wakefield, Burnley, and Portsmouth. Borough Electrical Engineer in each case.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £74 10s. to £75 (last week, £71 5s. to £71 15s.).

Change of Address.—E. Brook, Ltd., late of 178 Gray's Inn Road, W.C., have removed their London office to 11 Queen Victoria Street, E.C. (Tel. City 4468).

Liquidations.—A meeting of the Wolf Safety Lamp Co. will be held at the offices of John Gordon & Co., 19 Bond Street, Leeds, on April 19th, at 3 p.m., to hear the liquidator's account of the winding-up.

Miniature Rifle Ranges.—The British Westinghouse Electric & Manufacturing Co., Ltd. (Trafford Park, Manchester), have sent us a photograph of their miniature rifle range which is being used for the training of some of the Manchester Battalions. The Company have long had a small range at the Westinghouse Club, and this larger range was built at the outbreak of war. No less than thirty-six men can shoot at one time on this range, ten at 25 yards, and twenty-six at 50 yards. The cost of the range, together with the rifles, telescopes, &c., was largely covered by voluntary subscription of the employees, and a considerable part was built by them. The Westinghouse Company gave considerable financial assistance and lent the grounds.

The Electrical Equipment of Docks.—A compulsory winding-up order has been made against Messrs. Tannett-Walker & Co., hydraulic and general engineers, of Hunslet, Leeds. The Official Receiver, in his report upon the affairs of the Company, attributes the failure as being partly due to the change from hydraulic to electric machinery in the equipment of docks and railways.

German Turbine Orders Cancelled.—*The Times* states that the Lambton & Hetton Collieries, Ltd., has cancelled a contract placed with the A.E.G. of Berlin some time ago for three large turbo-alternators for their Philadelphia power station. The order has now been divided between J. Howden & Co. (Glasgow), W. H. Allen, Son & Co. (Bedford), and Siemens Bros. Dynamo Works, Ltd. (London).

LOCAL NOTES

Aylesbury: *Hired Motors.*—The Council has agreed to adopt a scheme put forward by the British Thomson-Houston Co. for hiring out motors. Accommodation will be found at the electricity works for exhibiting the motors.

Burton: *Rate in Aid.*—The Electricity Committee recommends the sum of £4,000 being transferred to relief of rates for the year to March 31st, instead of £8,000 as in the previous twelve months. The reason for this is the prospective increased price of coal and the fact that at the moment the undertaking has practically no reserve fund.

Bury: *A Correction.*—We regret that the note published in this column last week with regard to the refusal to sanction a loan at Bury was incorrect. There has been no L.G.B. inquiry at Bury for nearly twelve months. Although it had been proposed to proceed with certain extensions of the Chamber Hall Power Station, at an expenditure of £25,000, the greater part of which work had already been sanctioned by the L.G.B., it has now been decided not to proceed with the work at present in view of the general request of the L.G.B. with regard to the limitation of expenditure on extensions.

Coventry: *Loan Sanctioned.*—The Treasury has given consent to certain extensions of the electricity plant in order to meet the demand from factories employed upon Government work. The loan (£46,932) has been sanctioned without the usual formality of an inquiry, and the work is now in hand.

Dublin: *The Increased Lighting Charges.*—Once more the Electricity Committee has to report a change in its plans with regard to the increased charge for electrical energy. As reported in our columns, it was at first announced that an increase of $\frac{1}{2}$ d. per unit for lighting supply and $\frac{1}{2}$ d. per unit for power would be necessary, but subsequent consideration rendered it necessary to increase this to 1d. in the case of lighting and $\frac{1}{2}$ d. in the case of power. Now, however, it is indicated that the estimates upon which the increased working costs were based were not absolutely accurate, and that as a result only "a small increase" in price to consumers need be apprehended.

Kingston: *Increased Charges.*—The Electricity Committee having, mainly through the reduction in the street lighting, to face a deficit of some £1,300 in the coming year, has decided that the consumers, and not the rates, must bear the loss, and an increase in the lighting rate of from 5d. to 6d. per unit was recommended. When the matter came up for discussion in the Council, however, an amendment, authorising an increase of 10 per cent. upon all consumers except those protected by special contracts, was passed.

London: *St. Pancras: New Loan.*—A loan of £8,970 is to be taken up from the L.C.C. at 4 $\frac{1}{2}$ per cent. as follows:—mains, £2,587; plant, £1,140; services, £2,676; meters, £1,835; arc lamps for outside lighting, £732.

Manchester: *Fatal Electric Shock.*—An apprentice at the Westinghouse Works unfortunately received a fatal electric shock whilst testing motors last week. Mr. Topham, H.M. Inspector of Factories, at the inquest said that the work in question involved more or less temporary connections, and it was for that reason that testing departments were exempt from certain Home Office regulations, provided proper precautions were taken. In his opinion, the necessary precautions had been taken, and the accident was unavoidable.

Pembroke (Ireland): *Increases in Charges.*—In view of the increase in capital and other charges, and the possibility of still further rises in the price of fuel, the Electricity Committee recommend increases in the charge of electricity of one penny per unit for private lighting, 4d. for heating and cooking. Increases are also recommended for power supply.

Tunbridge Wells: *Loan Refused.*—After a protracted inquiry concerning a loan of £7,520 for electrical extensions, Mr. H. R. Hooper, the L.G.B. Inspector, indicated that it is very improbable that the loan will be sanctioned, presumably owing to the absence of exceptional circumstances.

COMPANIES' DIVIDENDS, REPORTS,
MEETINGS, &c.

Metropolitan Electric Supply Co.—The progress of this Company was quite satisfactory during the first half of 1914, said the Chairman at the annual meeting last week, but the war soon placed the Company in difficulties both as regards coal supply and the loss of some of their most experienced workmen. Then the unforeseen loss of revenue from street lighting had to be faced during the usually most profitable months of the year, hence the reduction in dividend. With regard to the London power scheme, he looked forward to friendly co-operation between the Companies and the County Council, and the evolution of a satisfactory scheme.

City of London Electric Lighting Co.—The reduction of 1 per cent. in the dividend for 1914, compared with 1913, was attributed to similar reasons to those given by the Chairman of the Metropolitan Company at the annual meeting. The right of the City Corporation to purchase the City portion of the Company's undertaking expired on February 18th, and the Chairman thought the shareholders might now take it that the undertaking was secured to the Company for the rest of the term of the Provisional Order.

Brompton & Kensington Electric Supply Co.—Attention was drawn at the annual meeting on Thursday to the fact that although the Company's undertaking earned £1,200 less in 1914 than in 1913, and £1,700 less in 1913 than in 1912, the Assessment Committee has increased the assessable value by £1,450. An appeal is to be made. The accessories business continues to make satisfactory progress, and designs have now been completed for a great variety of apparatus. Equipments are being installed in several of the most important cities in the country, and a profitable development of this branch of the business is anticipated. In common with the other companies concerned in the Electric Power Bill, it is intended to persevere so as to arrive at an amicable settlement.

Newcastle-on-Tyne Electric Supply Co.—The Treasury has approved the issue of £167,000 4 $\frac{1}{2}$ per cent. consolidated first mortgage debenture stock.

British Electric Transformer Co.—At the annual meeting last week, the Chairman, Mr. A. F. Berry, explained the reasons for the reduction in dividend of from 10 per cent. to 7 $\frac{1}{2}$ per cent. The dislocation of transport was, he said, a material factor, whilst 80 per cent. of their workmen within the age limit had joined the Colours. Again, three of the largest contracts in hand for railway companies were held up, and practically the only work now being done is for the Government. Latterly, however, things had become more normal, and the shareholders might reasonably look forward to an improved result next year.

W. T. Henley's Telegraph Works Co.—Mr. George Sutton, the Managing Director, emphasised at the annual meeting last week that whatever might be the case elsewhere, the Company was not making large profits out of the supply of war materials. However, should they execute the orders now on their books and not take another order during the year, they would be able to pay the usual dividend in 1915.

W. T. Glover & Co.—Although the dividend recommended for last year is only 5 per cent., it was explained at the annual meeting last week that the amount in hand would have justified the directors in recommending 12 per cent. The fact, however, that the Company's business is largely with corporations and municipalities, upon whom it is not yet possible to measure the full effect of the recent Treasury regulations, has caused the directors to be exceedingly careful.

Sterling Telephone & Electric Co.—According to the *Financial News*, a mortgage of £10,000 has been carried through, the mortgagee being Lord Kitchener. Presumably this is in connection with work for the War Office, as the Company has made a special feature of apparatus for electrically firing mines, field telephones, &c.

British Westinghouse Co.—The report for 1914 shows a net profit of £151,627, to which is added £6,493 brought forward. General reserve is credited with £50,000; patents, goodwill, &c., are written off to the extent of £25,000; and after paying 7 $\frac{1}{2}$ per cent. on the preference shares, there is a balance of £8,121 to be carried forward. The net profit is considerably in excess of that in 1913, and substantial sums have again been charged against revenue for the maintenance of the works and plant, in addition to £50,846 for depreciation.

Brush Electrical Engineering Co.—The report for 1914 states that although the war caused a temporary diminution in business, orders received since the beginning of this year are above the average. The profits allow of placing £10,000 to depreciation, and debenture interest absorbs £19,109, leaving £7,065 to be carried forward. The experience with the Liungstrom steam turbine has been sufficiently satisfactory to justify further capital expenditure for its production on a larger scale. Subject to Treasury consent, it is proposed to issue the balance of the participating second debenture stock.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

SUMMARY

WE publish some further letters from central station engineers regarding the restriction of electricity works extensions (p. 138).

MR. C. B. SPARKS has been nominated as President of the Institution of Electrical Engineers for next session. We also publish a list of the other nominations to the Council for ballot next month (p. 139).

THE wiremen in the L.C.C. Tramways Department who came out on strike have decided to accept a decision by Sir George Askwith that the agreement under which they are working does not entitle them to any higher rate of wages during the two years' currency of the agreement (p. 139).

THE Development Committee of the I.M.E.A. is continuing its work, and hopes shortly to establish a scheme of publicity literature (p. 139).

MR. C. JOHNSON in a recent Paper described a year's experience with electric miner's lamps (p. 140).

EXPERIENCES with several types of colliery trailing cables were described by Mr. J. Bentham in a Paper before the Association of Mining Electrical Engineers (p. 140).

THE effect of leakage currents on oil in bearings was referred to at a meeting of the Association of Mining Electrical Engineers lately (p. 140).

ILLUSTRATED articles describe examples of mining switchgear and electrical plant (p. 141).

THE London electric supply companies have decided to increase their charges for lighting and power on account of the higher freightage on coal (p. 142).

PRACTICAL points in connection with D.C. motors were contained in a Paper by Mr. E. F. Butler read recently before the Association of Supervising Electricians (p. 142).

THE recovery of copper from the liquid in pickling vats is dealt with in our Questions and Answers column (p. 143).

AMONG the subjects of specifications published by the Patent Office last Thursday were a self-regulating booster transformer, a method of manufacturing condensers, special tubular lamps for street lighting, and a method of inductively loading duplex telephone lines. Patents relating to trolley-wire suspension and lead-covering of cables expire this week after a full life of fourteen years (p. 144).

CONSIDERABLE extensions to the electric supply system have been carried out at Ipswich (p. 145).

THE Treasury will not approve of the proposed expenditure of £271,900 on tramway extensions in London (p. 145).

MARCONI'S Wireless Telegraph Co. is unable to declare an interim dividend on the ordinary shares owing to outstanding questions of compensation from the Government.—The Automatic Telephone Co. reports satisfactory progress with its exchanges in various parts of the world.—Judgment for £2,640 has been given against the Marconi Co. in an action for breach of contract (p. 145).

The Treasury has sanctioned a loan at Haslingden (£12,000); the Llandudno Council having been refused a loan of £2,000 has decided to provide the money out of revenue; extensions are contemplated at Sheffield (£85,400); cable is required at Basingstoke and Hampstead; meters at Battersea; lamps for the Bristol Docks; tramcar trucks, motors, &c., at Bradford; and stores in various places (p. 146).

CONSIDERABLE development is taking place with the Ontario hydro-electric power scheme.—A Rateau turbo-generator has been put into operation at Bexley.—The Poplar Borough Council is reducing its lighting charge by 1d. per unit.—A scheme for generating electricity on a large scale in Ireland by water power is in contemplation (p. 147).

A DIVIDEND of 6 per cent. and a bonus of 12s. per share is declared on the North Metropolitan Electric Power Co.'s ordinary stock.—The British Aluminium Co. had a satisfactory year in 1914 (p. 147).

Obituary.—We regret to record the death on Tuesday of Sir John Cameron Lamb, formerly Second Secretary of the Post Office, from which position he resigned in 1905 after more than forty years' service. Sir John Lamb took a leading part in the general policy as to the relations between the Post Office and the National Telephone Co., and the acquisition of the trunk telegraph lines by the Post Office was carried out largely under his supervision. He was knighted on his retirement.

THE RESTRICTIONS ON ELECTRICITY WORKS EXTENSIONS

WITH reference to our articles on this subject (*ELECTRICAL ENGINEERING*, March 11th and 25th), we now publish extracts from further letters which we have received from central station engineers:-

Cardiff.—Mr. Arthur Ellis writes: I have no doubt that those authorities who are fortunate enough to have reserve funds in hand will be able to meet the requirements for the time being, and I have no doubt also that the L.G.B. afterwards will appreciate the position of those authorities from a financial point of view when they seek further borrowing powers. As regards Cardiff, perhaps we are in the happy position of having only recently completed considerable extensions to plant, &c., and having obtained loans from the L.G.B. for other purposes that will see us through for some period of time, and possibly the reserve fund that we have in hand will assist us out of any difficulty. As regards devoting profits to the relief of rates, I am pleased to say that my Committee so far are devoting their profits to a reserve fund until they are satisfied that they have a reserve fund of sufficient amount to meet the requirements of the undertaking, and provide for obsolescence of plant, depreciation, &c. I do not see that any advantage would be gained by suspending the contributions to the sinking fund, as it would be a very costly matter to do so, additional interest having to be paid during the period that such payments are suspended. As regards the concluding paragraph of your article upon the subject, I can hardly imagine that the electric supply authorities would be held liable to an action for not fulfilling their statutory obligations under the Electric Lighting Acts, &c., as, of course, in a sense the operation of such Acts are suspended as a result of the action of the L.G.B. and the Treasury.

Carlisle.—Mr. F. W. Purse writes: I do not agree with your suggestions to meet necessary expenditure out of revenue or reserve funds. Posterity should have a little to pay for, and it is hard enough now to struggle along with short loan periods, high rates of interest, and taxation without having to deplete reserves. The situation to my mind is quite clear; those works that are finding it necessary to extend must only be in such a position owing to heavy demands due to the production of war material, and for such the Government should give facilities for loans, and failing that the local authority can refuse to supply the extra demand. I think the L.G.B. will not object to sanctioning extensions and new schemes, but will delay the power of borrowing the money until the conclusion of the war. Most of the available works are turning out war munitions at a terrific rate, and at the conclusion of the war there is bound to be a big slump in this; if, therefore, a lot of other work is waiting to be proceeded with without delay, it will fill in the interval between the cessation of Government orders and the restoration of the normal trade dislocated by the war which cannot suddenly assume its natural dimensions. On the whole, therefore, I think the action of the L.G.B. is sound.

Croydon.—Mr. A. C. Cramb writes: Certainly those undertakings that have been able to build up their reserve will be in a happy position in regard to financing, at any rate, some of their extension work. With reference to allocation of profits to relief of rates, I do not think that is likely to worry us, at least for some time to come, considering that our coal is costing us about £240 per week above what it should do.

Eastbourne.—Mr. J. K. Brydges writes: We are not affected by the refusal of the L.G.B. to grant loans for extensions, as we received sanction for a loan for £4,000 for new feeder cables and extensions early last year. Our capital expenditure since has all been taken out of our reserve fund, which fortunately, with renewals fund, stands at about £21,000. This will, however, be rather heavily drawn upon within the next few years, as we bought a 1,500-kw. turbo-alternator the year before last which cost £5,427; we have a new switchboard on order, £1,150; a 1,250-kw. "Ljungstrom" turbo-alternator, £6,000; cables, transformers, substations, &c., not included in the cable loan, £1,400. This makes a total of £13,977. We shall also be requiring a new boiler and an extension of our cooling-water pond within the next two years, which will probably run into another £3,000, so that there will not be very much left in our reserve fund. It is certain, however, that our net profit for the current year will, as in the past, be allocated to our reserve fund. Fortunately there have been only two allocations out of the profits to the relief of the rates of £750, or £1,500 in all, eight or nine years ago. The net profit has always been divided between the reserve and renewals fund and reduction of charges. All our meters are purchased out of the revenue, amounting to £300 or £400 per year.

Glasgow.—Mr. W. W. Lackie writes: The present situation with regard to the refusal of the Local Government Board to sanction borrowing powers for further extensions does not affect Scotland, as we get our loans through the Secretary for Scotland, and luckily, so far as we in Glasgow are concerned, a loan of £500,000 was sanctioned in November, 1912. This will go a long way towards covering the work we at present have in hand. I am afraid you are under a misapprehension with

regard to the use of the reserve fund. This fund simply exists on paper. It is already used in the business, and so saves payment of interest, &c., out of revenue for capital which would otherwise require to be borrowed. At a time like the present, however, we in Scotland experience the value of refusing to allocate surplus revenue from Corporation trading departments to the relief of local rates.

Halifax.—Mr. W. M. Rogerson writes: For some little time past we have been extending our plant out of revenue, and have spent some £15,000 in this way. With regard to the allocation of profits to the relief of rates at Halifax, each trading undertaking must contribute an amount equal to $\frac{1}{2}$ per cent. upon the gross capital yearly. Any profit made over the above $\frac{1}{2}$ per cent. can be used by each undertaking as it thinks fit.

Leeds.—Mr. C. N. Hefford writes: Up to the present I have no reason to suppose that the policy of the Government will be applied in such a way as to interfere seriously with the Leeds electricity undertaking. We have important extensions in progress which have been generally approved by the Local Government Board, and, so far as I can judge at present, no interference with really necessary extensions will take place in the case of undertakings serving industrial areas. Perhaps a more-likely cause of difficulty will be the appropriation of engineering works for war purposes, leading to delay in the delivery of generating plant, but I cannot think that even in this direction the Government will take steps which would diminish the usefulness of electric supply undertakings, and thereby limit the output of war materials, in the manufacture of which electrical energy is used. The Leeds Corporation have issued instructions for the restriction of capital expenditure to the smallest practicable figures, and in pursuance of this policy the Electricity Department will largely reduce its activities in the matter of mains extensions, upon which item something like £80,000 has been spent during the past year, but it is not intended to place any difficulties in the way of intending consumers who require supplies for industrial purposes. With regard to the question of spending money out of reserve funds, it appears to me that this would be little better than an evasion of the Government's orders, as, whatever the source of the money, any capital expenditure needlessly incurred at present represents an encroachment upon the funds available and reduces the facilities for obtaining money for national purposes. The same remark, I think, applies to the suggestion for the suspension of the contributions to the sinking fund.

Tunbridge Wells.—The recent L.G.B. inquiry, with its probable result, was referred to briefly in our last issue (p. 136), but the following particulars are of interest. The loans for which sanction was required were for extensions in the boiler-house, and a cooling tower. Mr. Ross Hooper stated that he would not recommend the Board to grant the loans, and that the Electricity Department must cease connecting any more consumers. Undertakings that had no spare plant, he said, were to continue to run without spare—they must take the risk, and the consumers must, if necessary, be put to inconvenience until the war is over. The refusal of the loan for the cooling tower, Mr. R. N. Torpy tells us, places him in a very awkward position. The existing and only cooling tower is in such a decayed state as to be nearly falling down; in fact, it has been partly blown down on two occasions; besides this, it is not much more than half the capacity required for ordinary working conditions. He was informed that they must run non-condensing during the summer, and pull the old tower down and rebuild it out of revenue. It was pointed out to Mr. Hooper that a further loan for mains would probably be asked for, as it was necessary to duplicate a number of high-tension trunk mains owing to the fact that they last winter were working on a 25 per cent. overload; but he replied that in all probability the Board would not entertain the loan, and that the mains must continue on this overload. On the other hand, the various Government departments are not entirely consistent, as four very large gangs of men have just been laying miles of telephone cables and conduit for private subscribers all over the town. Mr. Torpy raises another interesting point. He says: We have a large reserve fund, and anticipate a large net profit this year just completing; it would therefore be anticipated that some of the new expenditure could be made from this source; however, the legal side of the question comes to the fore, and we are advised that this cannot be done legally, although I understand undertakings are doing it throughout the country. I am certainly of the opinion that it would be of great advantage if the Board would express their opinion on this point, and that, owing to the exceptional circumstances, undertakings should be allowed to use their surplus and reserve fund to defray necessary capital expenditure. In conclusion, I must say that if it is necessary to curtail all further advancement of undertakings which are now applying for further loans, it is surely necessary to curtail expenditure of undertakings which already have large loans granted and unexpended.

A number of other letters have been received, which will be published in our next issues, and further correspondence is invited.

THE INSTITUTION COUNCIL

THE nominations by the Council of the Institution of Electrical Engineers for the new Council for 1915-16 will be received by members this morning.

It had been the unanimous desire of the Council to nominate Sir John Snell for a second year of office as President, but he regretted that for reasons of health and on account also of the claims of his professional work he felt unable to accept a second year of office.

Mr. C. P. Sparks has therefore been nominated as President, and we are sure that this will be received with universal favour. Mr. Sparks has served several terms on the Council, was Vice-President from 1906 to 1909, and was Senior Vice-President in 1907-8 during the term of office of Lord Kelvin as President, so that he has frequently presided at the meetings of the Institution. He is Engineer-in-Chief to the County of London Electric Supply Co., and has an important consulting practice especially in connection with the use of electricity in mines.

Dr. Alexander Russell (Principal, Faraday House) and Mr. Roger T. Smith (Electrical Engineer to the Great Western Railway) are nominated as Vice-Presidents in succession to Messrs. W. Judd and C. H. Merz, whose period of office has terminated; the two Vice-Presidents who remain in office are Mr. J. S. Highfield and Mr. C. H. Wordingham. Mr. Robert Hammond is nominated for re-election as Honorary Treasurer.

There are five vacancies for ordinary Members of Council, and eight nominations have been made for the ballot next month:—Mr. W. A. Chamen (Engineer and Manager of the South Wales Electric Power Distribution Co.), Mr. H. Dickinson (City Electrical Engineer, Liverpool), Mr. H. W. Firth (Electrical Engineer to the Great Eastern Railway, who read a Paper last session on the "Electrification of Railways as affected by Traffic Considerations"), Prof. T. Mather, F.R.S. (Professor of Electrical Engineering, City and Guilds Engineering College), Mr. H. Faraday Proctor (City Electrical Engineer, Bristol), Mr. G. S. Ram (H.M. Electrical Inspector of Factories), Mr. W. Slingo (Engineer-in-Chief to the Post Office), and Mr. A. H. Walton (Manager, Rugby Traction Dept., British Thomson-Houston Co.).

The five vacancies are caused by the retirement in the ordinary course of Messrs. F. Gill, W. Rutherford, A. H. Seabrook, and by the nominations of Dr. Russell and Mr. R. T. Smith as Vice-Presidents. The ordinary Members of Council who remain in office are Messrs. R. A. Chattock, J. Christie, Prof. B. Hopkinson, F.R.S., G. W. Partridge, W. H. Patchell, R. J. Wallis-Jones, and W. B. Woodhouse.

The three Associate Members of Council all remain in office, and are Mr. F. E. Berry, Major E. O. Henrici, R.E., and Mr. A. W. Martin. Mr. E. Russell Clarke and Mr. A. M. Ogilvie, C.B., remain in office as Associates on the Council, but Mr. H. C. Lewis retires, and Mr. J. Hunter Gray (a well-known barrister in patent actions) is nominated in his place.

It is open to any ten members to nominate other candidates for election before the 21st of this month.

STRIKE OF L.C.C. WIREMEN

AS announced on page 126 of our last issue, the wiremen employed in the rolling-stock section of the L.C.C. Tramways Department have been on strike for an increase in wages of from 10d. to 10½d. per hour, the latter being the recognised rate for men employed as wiremen in buildings by electrical contractors in London. The history of this is given in a report by the Highways Committee to the London County Council this week. The rolling-stock wiremen are at present working under an agreement dated April 3rd, 1914, the period of the agreement being two years, and the rate being 10d. per hour. Since then, as is known, the rate for ordinary wiremen in London has been agreed upon as 10½d., and it is claimed that the agreement of April 3rd, 1914, affecting the L.C.C. rolling-stock wiremen, entitles them to any higher rate which might be agreed upon generally during the period of the agreement. This point was submitted to Sir George Askwith, Chief Industrial Com-

missioner, who decided against the men. The latter, however, refused to accept this decision, and 46 of the rolling-stock wiremen out of 49 struck, whilst 12 of the 24 armature winders employed in the Tramways Department also came out. The Committee remind the Council of the necessity for agreements between the Council and its employees being regarded as binding, but since we went to press last week, the strike has been ended by the receipt of a statement from the three representatives of the men on the Tramways Conciliation Board (Rolling Stock Section) that they have decided to accept the decision of Sir George Askwith.

THE DEVELOPMENT COMMITTEE OF THE I.M.E.A.

AT the last meeting of this Committee the reports of the sub-committees referred to some difficulty in progressing with the operations owing to the present conditions. The question of the production of printed publicity matter was discussed. It is anticipated that a scheme for carrying on publicity work by means of printed matter, Press advertisements, &c., will shortly be brought before the full Committee, and the Committee will endeavour to elaborate arrangements which may, it is hoped, be put in hand in the near future, or at least as soon as general conditions are such as to induce municipal undertakings generally to support the same. Capt. H. C. Palmer (of the General Electric Company) and Mr. L. G. Tate were co-opted members of the Publicity Sub-Committee.

Further discussion arose around the work of the Sub-Committees on "Domestic Appliances" and "Electrical Installations" (Hon. Secs., Messrs. Roles and Allen), and proposals from these gentlemen were considered. It was understood that those and other similar Sub-Committees would probably be able to carry on a very considerable amount of valuable work of a definite character, and in the direction of collating and analysing the mass of information at present existing amongst engineers and manufacturers on the subjects dealt with by the Committees, and that the results of such investigations would be available to the full Committee and also would form useful matter for the guidance of the operations of the Publicity Committee. A further question of making such information generally available for manufacturers and the electricity using public received consideration, and will be referred to again later. The next meeting of the Development Committee will be held on Friday, April 16th, at the Institution of Electrical Engineers.

An Electrically-worked Rolling Lift Bridge.—In the course of an interesting article in the *Engineer* reference is made to the new rolling lift bridge across the Blue Nile at Khartoum, which, as it has a length between abutments of 1,833 ft. 9 in., ranks as the longest and most important bridge in tropical Africa. In addition to two approach spans there are seven more spans, each of 218 ft. 6 in., and a rolling lift span giving a clear opening of 100 ft. The bridge has a clear width between trusses of 36 ft., divided into a 15-ft. clearway for railway track on the east side and a 21-ft. clearway for road and tramway on the west side, and there is also a cantilever footpath, carried outside the west trusses, of 11 ft. clear. Provision has been made to carry an additional cantilever footpath on the east side and a double line of track between the trusses. The rolling span is electrically worked by two 50-h.p. 220-volt continuous-current motors supplied with current from a rotary converter situated in the signal cabin. The motors are geared to a simple rack mechanism, and the controller is interlocked with the locking bolts and signals. The lighting of the bridge is effected by thirty-six 70-volt Osram drawn-wire lamps. These are run two in series off the three-phase mains. Current is taken from the Khartoum Town supply and is delivered at the signal cabin at 3,000 volts three-phase, where it is transformed down to 140 volts. Electricity was used as far as possible for all power and lighting during the construction of the bridge.

University College, London.—The Annual Report reports a considerable decline in the total number of students owing to the large numbers taking an active part in the war, although there has been a slight increase in the number of part-time students. The Faculty of Engineering has been most affected, nearly all the second- and third-year men having either taken commissions or enlisted. The College has organised public lectures in connection with the war, and a large number of Belgian refugee students have been received at nominal fees. Some important changes and additions have been made in the staff of the Faculty of Engineering during the past year. Professor E. G. Coker has succeeded Professor J. D. Cormack in the Chair of Civil and Mechanical Engineering, and Mr. E. R. Matthews, the new Chadwick Professor of Municipal Engineering, has taken up the duties of his Chair.

ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Published on the First Thursday of each month

ELECTRIC MINER'S LAMPS

A meeting of the North Staffordshire Branch of the National Association of Colliery Managers recently, Mr. C. Johnson described experiences extending over one year with electric miner's lamps of the "Ceag" type, in a colliery where about 125 of these lamps were in use. The initial cost of the installation, including charging stand, &c., worked out at about £1 per lamp, and one year's actual maintenance cost was 6d. per lamp per week. Comparisons were made between districts using oil and electric lamps, and, largely owing to the better light and freedom from going out while at work, the advantage went to the electrically-lit district, where the wage-earning power of the workman was increased. He was of opinion that the greater illumination had reduced the cases of nystagmus. With regard to accidents, although he could not trace a definite diminution in number, the injuries had been less serious, and over 72 per cent. of the accidents had occurred to persons using oil lamps. He had taken a large number of photometric tests, the result of which averaged as follows:—

Foreign accumulators and bulbs when charged gave 0·92 c.p.; discharged, 0·89 c.p. Foreign accumulators with new English bulbs when charged gave 0·78 c.p.; discharged, 0·69 c.p. New English accumulators and new English bulbs when charged gave 0·83 c.p.

The procedure in the lamp room is as follows:—The shift's work below ground being over, the lamps are delivered at the appointed place. The lampman at once unlocks each one, passing the shield on one side and the accumulator on the other. The contact pins are then removed and put into a jar containing soda. Fresh pins are put into the accumulators, which are then arranged on the charging board. The current, at from 1 to 1½ amps., is switched on and each cell tested with the voltmeter, to see if they are working properly. If so, they are allowed to remain there from five to six hours, until they register 2·6 volts, at which point they are removed and put ready for work. All accumulators are washed out with clean spring water and refilled with acid once every month. All contact plates and pins are oiled each day with a mixture of engine oil and colza.

The subject of electric miner's lamps was also dealt with by Mr. J. George at a meeting of the Association at Edinburgh. The author admitted that the first cost of electric lamps was a little higher than that of flame lamps, but the better light resulted in cleaner coal and less liability to accident. The company which he represented had supplied 75,000 electric lamps, which were in daily use. It was a great advantage to have a lamp which did not go out suddenly when jerked.

COLLIERY TRAILING CABLES

A PAPER on this subject, by Mr. J. Bentham, was read recently before the Yorkshire Branch of the Association of Mining Electrical Engineers, in which he described the experiences of the new Sharlston collieries with various types of trailing cable. The original trailing cables used when electrical working was first introduced at these collieries thirteen years ago consisted simply of two vulcanised india-rubber single conductor cables tied together at intervals of about a foot with tarred string. These gave considerable trouble, and were afterwards enclosed in a hose-pipe, but this made them very unwieldy, and dirt and moisture used to collect inside the pipe. The next type tried was a pair of single conductor rawhide braided cables, which were abandoned owing to fondness of mice for the leather. A twin cable, sheathed with ordinary leather, answered well for a time in dry situations, but in damp places became mouldy and rotted through. Vulcanised rubber and bitumen insulated cables were next experimented with, but the chief drawbacks were: the conductor wires breaking, its unusual size owing to the extra bitumen sheath, the bitumen cracking inside the whipcord sheathing, and the whipcord sheathing rotting in damp positions. A rope winding over vulcanised rubber-insulated cable proved unsatisfactory owing to the rope getting cut and frayed and unravelling. The next type

tried was vulcanised rubber cable with a whipcord protection on it. Being without bitumen, this cable was more flexible, but there were troubles due to the conductor wires breaking and the rotting of the whipcord. These were used until "cab tyre" sheathed cables became available. The first cost of these is considerable, but they will outlast any of the others tried. The main features in which they could be improved were by the conductors being made more flexible and by having more of the cab tyre material between the conductors. In fact, he said that if the cab tyre sheathed cable were made with more flexible conductors, all the conductors farther apart, and more cab tyre in between and around all conductors, it would be ideal.

In the discussion, Mr. G. Preece said that Mr. Bentham's requirements could be met, but would increase the cost of the cables further. It was for the management of a colliery to consider whether it was better to lay out the money on one cable that would outlast four or five cheaper ones. Putting more insulation round the conductors would make the cable more unwieldy, and sacrifice flexibility, even though the conductors might be made up of finer wires.

LEAKAGE CURRENTS AND OIL

IN the course of a paper on the "Use and Abuse of Oils in Mining Plant," read recently before the West of Scotland Section of the Association of Mining Electrical Engineers, Mr. T. C. Thomsen referred to the effect on the oil in a generator bearing of currents through the bearing which would either be produced by leakage or, in the case of turbo-alternators, by currents induced in the shaft. When such currents are present, the oil, he says, will quickly darken in colour, increase in acidity, and throw down a deposit which will coat all parts of the turbine with which the oil comes in contact, lodging particularly in the oil cooler. This deposit is of a fairly hard, brittle nature, and of a dark chocolate colour; it is exceedingly difficult to remove, and is therefore very objectionable. The remedy is to insulate one of the generator main bearings completely from the turbine bedplate, including the connections between the oil pipes and that particular bearing. On rare occasions, local currents may cause corrosion of the oil tubes in the oil cooler, or of the turbine shaft and bearings, and even corrosion in the governor, causing the oil-operated piston to stick.

MINING CABLES

SOME interesting notes on electric cables for collieries are contained in a booklet that is being issued by W. T. Glover & Co., Ltd. (Trafford Park, Manchester). Trouble with mining cables is more often due to leakage currents than acid pit water, and the less fibrous material there is in the inner construction of a pit cable the better, particularly when a lead sheath is necessary, which is particularly liable to electrolytic attack. Of non-hygrosopic insulating materials, the choice is practically between rubber and bitumen, the former of which is seldom feasible owing to its cost. The early troubles of decentralisation have been overcome, and such cables are now able to withstand a very wide range of temperature. It has also been found possible to remove from multicore bitumen cables the fibrous tapes and wrappings which were formerly necessary to provide the insulation of the various cores with mechanical strength. A good example of the strength of the insulation of a modern bitumen cable is furnished by a case where five tons of cable fell down a 150-yard shaft, and the worst kinks in the tangled cable showed no short circuits, and only broke down at some thousands of volts when tested. The booklet goes on to urge the necessity for care in bonding and earthing. As regards making off in bye, two points should always be observed: the necessity of using totally enclosed switchgear and the undesirability of using rubber tails. To meet these requirements only such bifurcating or trifurcating boxes should be used as form in themselves an integral part of the switchgear carcase, and to this end, switchgear manufacturers cannot collaborate too closely with cable makers to meet the exact requirements of each individual order.

HAULAGE MOTOR CONTROL PANELS

HERE is a growing tendency to instal complete panels for the control of the motors in preference to ordering the controller, circuit breaker, ammeter, and other items separately, and mounting them on an improvised structure when they arrive on site. The General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.) have recently constructed, to the special requirements of a number of collieries, a form of control panel for haulage motors, which they have now standardised. In designing these panels, the aim has been to provide as compactly as possible a mistake-proof unit containing the whole of the motor control gear.

The unit consists of a strong frame carrying a grid type controller resistance, mounted on steel bars, and insulated by mica. The whole resistance is enclosed in a boiler plate cubicle, and on the front of the panel the controller is mounted, whilst the circuit breaker and ammeter, both of which are totally enclosed, are situated on top. There are no loose connections. The cables pass into a special terminal box, where they are firmly held, the strain being taken from the conductors by an armour clamp. The mistake-proof characteristics are added to by the inclusion of an electrical interlock between the circuit breaker and controller, which prevents the circuit breaker being closed with the controller in any other than the off-position. To facilitate transport along roads, the "Witton" panel is mounted on skids, and these are provided with bolts and rings to which the dragging ropes can be attached.

SELF-CONTAINED HAULAGE MOTOR CONTROL PANEL.

ated on top. There are no loose connections. The cables pass into a special terminal box, where they are firmly held, the strain being taken from the conductors by an armour clamp. The mistake-proof characteristics are added to by the inclusion of an electrical interlock between the circuit breaker and controller, which prevents the circuit breaker being closed with the controller in any other than the off-position. To facilitate transport along roads, the "Witton" panel is mounted on skids, and these are provided with bolts and rings to which the dragging ropes can be attached.

EXPLOSION-PROOF SWITCHGEAR

HE latest development in the extensive range of G.E.C. explosion-proof switchgear for fiery mines, made by the General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, E.C.), is the 20-ampere 500-volt double-pole explosion-proof switch with fuses shown in Fig. 1.

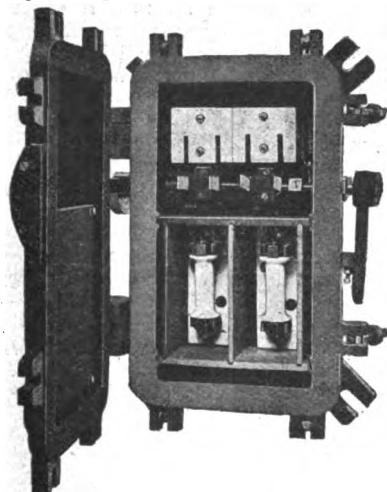

FIG. 1.—20 AMPERE EXPLOSION-PROOF SWITCH WITH FUSES.

It consists of a standard double-pole twinbreak switch, actuated by an external handle working through an explosion-proof gland. The interlock between the switch and the lid renders the apparatus mistake-proof. The fuses, which are of the standard bobbin type, are contained in a separate

fireproof compartment; arcing shields and thorough fire protection are provided throughout. If desired, the switch can be had without the fuses. In any piece of switchgear the three possible exits for the products of an explosion are the joint between the lid and the case, the point where the switch spindle passes through the case, and the cable entry. These details have been well considered. The joint between the lid and case is made by well-machined flanges, giving a close metal-to-metal joint, and in no place is the flange cut into for the purpose of taking the holding-down bolts. Special attention has been paid to the part where the switch spindle enters the case, this being the weakest point of many designs

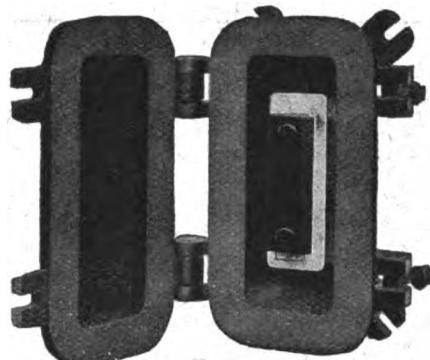

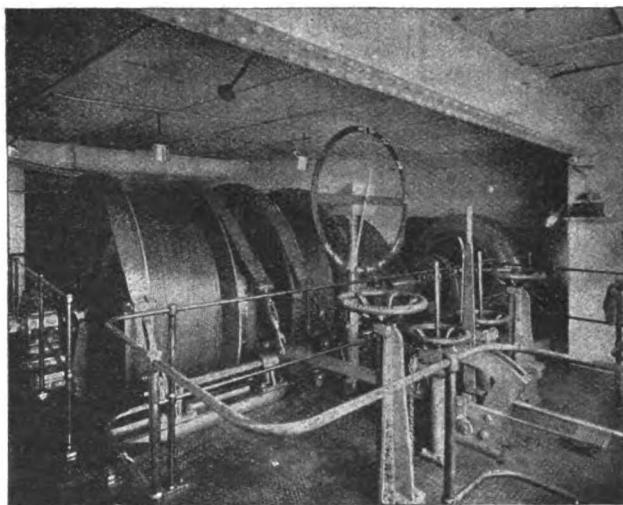

FIG. 2.—EXPLOSION-PROOF MINING FUSE.

of such gear, and a special flameproof gland is provided which entirely precludes the exit of the gases. The switch is designed to take the standard G.E.C. flameproof cable glands, which also afford a ready method of attaching the armouring of the cable to complete the earth connection.

Further additions to the range of mining gear are explosion-proof fuses, as shown in Fig. 2. These fuses are contained in flameproof cast-iron cases of substantial design. As in the switches, particular attention has been paid to the flame-proof flanges which effectively cool the products of any explosion inside the cases. The fuse-holders are of the Home Office bobbin type, and thoroughly protect the hand against dangers of shock or from the effects of a blowing fuse.

UNDERGROUND HAULAGE GEAR

AN example of a well-arranged electric haulage gear in the Seaton Burn Colliery is illustrated here. This has been designed to give a mean rope speed of 10 miles per hour, with a total length of rope of 4,500 yards. The haulage is driven by a 300-h.p. "Witton" slip-ring induction motor running at 290 r.p.m., and supplied at 2,750 volts, 40 cycles, from the mains of the Newcastle-on-Tyne Electric

300 H.P. HAULAGE GEAR AT SEATON BURN COLLIERY.

Supply Co. There are two drums, each 7 ft. in diameter on the roll, 10 ft. diameter over flanges, and 2 ft. 6 in. wide between flanges. They are made in halves. Between the motor and the haulage a Reich flexible insulated coupling is provided. A dial-type indicator is fitted to the main drum, and is driven through the drum boss by worm gearing.

The motor is controlled by a liquid controller designed so

that the motor can be started, stopped, reversed, and its speed regulated by a single lever. Movement of this from the "off" position first closes the oil-immersed stator or line switches. A further movement introduces a liquid resistance into the rotor circuit until the "full on" position is reached. All the parts are mechanically interlocked so that it is impossible for them to move in any but the correct order. Backward movement of the lever reverses the sequence of operations. In order to dissipate the heat generated in the liquid resistance when starting up, a special cooling system is included which effectively cools the liquid.

The General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.), were the contractors for this electrical plant, and in addition to this gear have also recently supplied the electrical equipment for the conversion of two existing steam-driven haulages. A main-and-tail haulage, previously steam-driven, is now driven by a 150-h.p. "Witton" motor running at 300 r.p.m. off the 2,750-volt, 40-cycle supply. The control gear is similar to that described. A further conversion was an endless haulage working on the surface, which is now driven by a 75-h.p. "Witton" motor, and also controlled by a liquid controller.

Increased Charges for Electricity Supply.—The City of London Electric Lighting Co. notifies that as from the March meter readings electricity supplied for lighting purposes will be charged for in accordance with the existing sliding scale, the alternative fixed rates for general lighting supply being withdrawn. The sliding scale is 5d. per unit for the first six units per 30 watts of connected demand in each quarter, and 2d. per unit for all energy consumed in excess of such quantity per quarter. We understand also that all the other London companies have agreed upon an increase in their lighting charges. An increase of 10 per cent. in the power rates is notified by the Charing Cross, West End & City Electricity Supply Co., and presumably applies also to the City Co.

The main reason for the advance in price is the freight on coal, whilst, in addition, labour is now costing some 10 per cent. more owing to a war bonus. It is claimed that the increased charge to the consumer, however, only represents the extra freight charges.

The Work of the Patent Office.—The annual report of the Comptroller-General of Patents refers to the special legislation by which, during the war, patents held by enemies can be avoided or suspended or compulsory licences granted under them. Applications of this nature have been heard by the Comptroller and Sir Cornelius Dalton, and as a result 172 licences have been granted, two patents avoided, and one suspended by the Board of Trade. Corresponding arrangements have been made in relation to trade-marks, and certain extensions of time regarding the payment of fees and filing of documents have been made in view of the war. In the main, continues the report, the policy has been to attempt to carry on as far as possible all applications before the Patent Office, and even to receive further applications from alien enemies. No patent rights are, however, granted, and the question of extending the time for the doing of any act or the payment of any fees is considered only when the applicant is in a position to pay the fees or carry on proceedings. The policy of this emergency legislation has not been to confiscate patent rights owned by alien enemies, but rather to foster the sale and manufacture of goods by giving an effective security against any legal proceedings for infringement hereafter. With regard to the general trend of invention, naturally applications relating to naval and military subjects have increased considerably. The electrical industry as a whole is very prominent, there has been continued progress in automatic telephone systems, and attention has been given to receiving arrangements for cable telegraphy, and to ionised-gas relays for use in telephony and wireless receivers.

Dispute about a Welding Machine.—An action concerning a welding machine, which has just concluded after a long hearing before an official referee in London, must have cost many times the sum involved in legal expenses. The British Insulated and Helsby Cables, Ltd. in 1912 supplied the Crittall Manufacturing Co., of Braintree, Essex, with an electric welder for dealing with casement frames from 1 ft. to 10 ft. square at a cost of £444, the contract stipulating a capacity of twelve frames an hour and an accuracy at the weld of five-thousandths of an inch. It was alleged that the machine failed to carry out the contract conditions, and whilst the makers claimed for the value of the machine, the Crittall Co. counter-claimed damages. The official referee decided that the machine failed to fulfil the contract conditions, and that the defendants were not bound to accept it. It was alleged by the makers that the welder was put to do work for which it was never intended. The counter-claim for damages, however, failed.

PRACTICAL NOTES ON D.C. MOTORS

A PAPER containing many practical points on D.C. motors, by Mr. E. F. Butler, was read at a recent meeting of the Association of Supervising Electricians. After outlining the main features of series, shunt, compound, and interpole machines, the author dealt with features to be attended to in the selection of motors. All parts of the machine should be easily accessible by removable covers or otherwise, especially the commutator and brush gear. It was also an advantage to be able to remove the armature from either end. The brush boxes should be castings and not flimsy stampings, should be capable of using up nearly all of the brush, and should have as few parts as possible. For the bearings of small machines, he preferred hard brass to white metal, and they should be arranged so that they can be moved from either side of the end plate. Elaborate oil gauges were unnecessary, a short overflow pipe was all that was required. It was important that the shaft, where taken up by the pulley or pinion, should be less in diameter than the journal. In the case of ball bearings, it was important that one end should have a thrust bearing, and great care should be taken that no knock or jar can take place. Belts should be carefully spliced, and gear or direct driving machines should be provided, where possible, with flexible couplings. Starters required more attention than was often given them, and semi-automatic or totally automatic starters had great advantages. Of purely mechanical faults, oil throwing or creeping was the most common, the usual cause was the overflow being wrongly set. In enclosed machines with internal fans, worn bearings sometimes caused the shaft to drop, leaving a gap through which the oil is sucked, unless special means are taken for keeping it out. Wrong connections were an occasional source of trouble in new machines, but were not difficult to diagnose. Interpoles on compounding coils were sometimes reversed. Other troubles were short circuits and disconnections of field coils. In order to locate the fault, disconnect the coils halfway and test each half. If necessary, disconnect further until the faulty coil is located. In the case of short circuited coils, if a voltmeter is available, the voltage across each coil should be taken separately. A good set of coils will not vary more than about two per cent. This method is also useful in testing out coils suspected of being carbonised, or burnt internally. In this case if pressure is applied to the coil while the voltmeter is reading, any fluctuation in the reading will confirm this. After a run, a short circuited coil will feel colder to the touch than a good one. The speed also will be high, and the brushes nearest to the faulty coil will spark. Increase of speed in a compound machine may be due to the shunt and series winding being in contact. The most common fault met with is sparking, which can be due to a variety of causes, in addition to the wrong position of the brush rocker. Brushes may be making poor contact. The brush may have worn low, the brush spring may be resting on the edge of the brush box, the holder may be loose on the spindle, or the brush be sticking in the holder. The proper distance from the commutator to the bottom of the brush box should be from 1/8 to 3/16 of an inch. Worn bearings may set up sparking owing to an unequal distribution of the magnetic field. Bad condition of the commutator is also another common cause. The usual troubles with commutators are—the mica between the segments standing high, and low commutator bars or flats. Low bars may be due, either to mechanical damage, or to some segments being softer than others. Flats often develop from low bars, or may be set up by causes external to the motor. Bad joints in belts are a very common cause, pulleys out of balance, or badly cut gearing, are also usual. Sparking due to overload can easily be recognised, being accompanied by heating up of the windings, and a reduction of speed. An open circuit will show as a green flash, arcing all round the commutator. This fault must not be mistaken for a somewhat similar one, in which the spark is of a red or yellow colour. This is due to dirt collecting on a sticky commutator, and can be removed by persistent cleaning. Sparking sometimes occurs because too many brushes are fitted, and more often because there are too few. Sparking may also take place owing to brush spindles being too close together, or too far apart; there will be more sparking in the first case than the second. In motors of more than two poles the brush holders should be staggered so that the commutator is covered by brushes of each polarity.

Royal Institution.—Among the arrangements after Easter are two afternoon lectures by Prof. J. A. Fleming on "Photoelectricity," and a Friday evening discourse by Prof. O. W. Richardson on "Electrons and Heat."

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,436.

I have recently been testing a small four-pole revolving-armature three-phase generator (A.C.). During the tests the question arose as to whether the machine was star- or mesh-connected. Several methods of ascertaining this were suggested, but none gave conclusive results. Is there any conclusive test which can be simply applied?—C. W.

(Replies must be received not later than first post, Thursday, April 8th.)

ANSWERS TO No. 1,434.

I wish to recover copper from pickling vats, of which we have a large number, each 9 ft. by 4 ft. by 4 ft. It is desired to deal with the liquid from six such tanks per week. It is proposed to use an electrolytic recovery bath, 4½ ft. by 2½ ft. by 3 ft., with a lead lining, forming the cathode and carbon anodes. What voltage and current density will give the best results, and is the scheme likely to be commercially profitable? The solutions to be dealt with nearly reach saturation.—J. L. L."

The first award (10s.) is made to "L. R." for the following reply:—

An analysis of the scheme suggested will show that it cannot be commercially used without some modification. The pickling vats each hold 144 cubic feet, if for the purposes of calculation it be assumed that they are entirely full. Hence, for six vats, 864 cubic feet of liquid have to be dealt with per week; making the same assumption for the electrolytic bath and neglecting the volume of the anodes, it contains 33½ cubic feet, therefore, 26 baths have to be dealt with each week, or say four a day. Reckoning for the moment that working can take place over 24 hours, this means six hours are allowed for obtaining the copper from each bath, that is, 5·6 cubic feet, or $5\cdot6 \times 28\cdot3 = 158$ litres of liquid must be electrolysed per hour. Pickling liquid comprises a mixture of sulphuric and nitric acids, and, for the present purpose, neglecting the effect of the acid on the solubility of the copper salt, the electrolyte can be looked on as a saturated solution of copper sulphate in water. It therefore contains about 39 per cent. of CuSO_4 , of which about 40 per cent. is copper, so that one litre of the liquid will contain approximately 155 grams of copper. Thus, 24,600 grams of copper have to be deposited per hour. Now, 1 ampere will deposit from a cupric solution in one hour 1.183 grams, so that 20,750 amperes are required to deposit the above quantity. The area of the lead lining of the bath, counting sides and bottom, comes to 53½ square feet, so that the current density of the cathode is 390 amperes per square foot. Now, ordinary current density for depositing copper electrolytically varies between 9 and 14 amperes per square foot (and the voltage required is from 0·5 to 1·5 volts, but this is only important as affecting the current density). From this it will be seen that the scheme exactly as set forth cannot be practically used, as the density would be forty times the ordinary figure and the copper deposited useless. Copper can be deposited at the high density suggested, but

only if there be very quick motion between the electrolyte and the cathode. Either the cathode may be moved quickly, or the electrolyte may be squirted thereon in jets. These latter cases will alter the conditions considerably, because a lead-lined tank cannot be used for the electrode, special electrodes must be employed. Further, as soon as this kind of treatment is involved, the bath cannot be left without attention, so that it would not be practicable to use in all probability anything like a 24-hour treatment. It is possible to increase the electrode area very considerably without increasing the size of the bath, by suspending a number of plate cathodes in the same bath. In this way, by placing, say, nine sheets across the bath, each of which would act as a cathode on two faces, an additional 140 square feet or so of surface could be obtained. This would reduce the current density almost to a quarter, but then it would be much too high. Further, not so much liquid would be contained in the bath. Again, the number of baths could be increased. It is, therefore, clear that some alteration is necessary, and whether this can be effected depends on the particular plant available. Certainly, it is not likely that it can be done with a single bath as suggested. It is quite possible that in this particular case the simplest solution will be to deposit the copper chemically, for instance, by the action of sulphuretted hydrogen, which throws down the sulphide and works very quickly, but in that event it will be contaminated with free sulphur if much nitric acid be present, because this will oxidise the sulphuretted hydrogen.

No second award is made.

ANSWERS TO CORRESPONDENTS

ARC.—An open-type 10-ampere arc lamp will give approximately 800 lower mean hemispherical candle-power, allowing for the loss in the globe (although the maximum in a particular direction reaches some 1,800 c.p.). The five lamps take 2,500 watts, including watts lost in resistance, or 500 watts each, so that the efficiency of each may be stated as 0·625 watts per mean spherical candle-power. In comparing this figure with that for other methods of lighting, you must be careful to see that mean hemispherical and not mean horizontal nor maximum candle-power has been considered.

H. TAYLOR.—You must give us further particulars of the nature of the circuit to be tested before your question can be answered satisfactorily.

Insurance of Diesel Engines.—At the March meeting of the Diesel Engine Users' Association the question of insurance of Diesel engines against breakdown was discussed. It was reported that a considerable proportion of Diesel engine plants were uninsured against breakdown, in consequence of the high rates charged by insurance offices. In nearly all cases in which insurances had been effected, these included damage to surrounding property, and the proportion of the amount insured to the total value of the plant averaged 35 per cent., and the ratio of the annual premium to the actual amount insured varied from 3 to 7½ per cent. Members of the Association were asked to keep careful account of the cost of repairs, as these would be of considerable assistance to the Association in dealing with the general question of insurance against breakdown. A scheme of insurance against breakdown was then outlined, under which members of the Association would be able to obtain advantageous terms. The proposal was referred to the Committee for further consideration. The next meeting of the Association is to be held on Wednesday, April 21st, when a discussion will take place on the whole question of the lubrication of Diesel engines. Information and particulars concerning the Association can be obtained from the Acting Hon. Secretary, Mr. Percy Still, at 19 Cadogan Gardens, S.W.

Volunteer Mechanical Transport.—The headquarters of the Mechanical Transport Column of the City of London National Guard Volunteer Corps have now been transferred to the offices of the Commercial Motor Users' Association (83 Pall Mall, S.W.). Colonel R. E. Crompton, C.B., has been appointed Hon. Commandant; Mr. E. S. Shrapnell-Smith, Commandant; and Mr. F. G. Bristow (Secretary of the C.M.U.A.), Adjutant of the Mechanical Transport Column. A composite convoy of the Column is conveying a number of members of the Guard to Brighton in connection with the Easter parades. The convoy will leave the Guildhall Yard on Wednesday next, the 31st inst., at 2.30 p.m., under the charge of the Adjutant, and will put down at the A.S.C., M.T. Garage, North Road, Brighton, by permission of Major W. Brailey, Officer Commanding. Owners of lorries who are willing to assist with the loan of their vehicles for subsequent Sunday parades are requested to make application to the Adjutant at 83 Pall Mall, S.W.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published March 25th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

5,511/14. Booster Transformers. B. HOLM-HANSEN. A booster or compound transformer having stationary primary and secondary windings, a series coil placed on a separate part of the core, and a movable armature without a winding dividing according to its displacement the flux induced by the shunt coil into two branches, one inducing a current in the series winding, the other having no inductive action, whereby the secondary E.M.F. is caused to vary in accordance with the position of the movable armature. (Two figures.)

5,583/14. Condensers. G. BURNSIDE and J. WALLACE. A method of manufacturing condensers in which the conducting plates are formed of layers of powdered metal spread upon the surface of, and cemented by, gold size or other suitable material.

6,739/14. Preparation of Nitrogen. B.T.-H. Co. (G.E. Co., U.S.A.). Isolation of the nitrogen from the air by leading air through an electrically-heated porous tube, causing a reducing gas, such as hydrogen, to enter the tube through the porous walls, and removing reaction products by known methods. This method is stated to produce nitrogen containing less than one half per cent. of oxygen. (Two figures.)

6,853/14. Incandescent Lamps. W. J. OWEN and C. DAMEY. Tubular lamps which can be arranged end to end in suitable fittings without wiring at intermediate points, as the feed wires are contained in the lamps themselves. (Three figures.)

14,595/14. Wireless Telegraphy. R. B. GOLDSCHMIDT. Elimination of extraneous signals by providing an intermittent contact maker putting the receiving apparatus in and out of operation at a frequency equal to a multiple or sub-multiple of that of the trains of waves to be received. (Two figures.)

22,270/14. Telephony. A. H. OTSSON and H. B. M. PLEIJEL. In self-induction coils for duplex telephone connections arranged on the Pupin system, the employment of two double coils inserted in each one of two double lines, and constructed in such a way that the duplex line is loaded by self-induction from the leakage field set up between the two coils by the current in the duplex line. (Three figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Arc Lamps: HUGHES [Lamp suspension] 5,662/14.

DYNAMOS, MOTORS, AND TRANSFORMERS: TAYLOR [Frequency changing] 2,060/15.

Electrometallurgy and Electrochemistry: LANDRETH [Electrochemical treatment of liquids] 3,181/14; CÔTE and PIERRON [Zinc furnace] 14,192/14.

Switchgear, Fuses, and Fittings: B.T.-H. Co. (G.E. Co., U.S.A.) [Automatic regulators] 5,639/14; HOLT [Circuit-breakers] 6,070/14; ALLOM [Reflectors] 6,173/14; JOYCE and SPAGNOLETTI, LTD. [Controlling switches] 7,900/14; COX [Switches] 12,976/14; MAHONEY [Circuit interrupters] 16,318/14.

Telephony and Telegraphy: SHEPARD and McKECHNIE [Line or wireless telegraph systems] 28,277 and 28,278/13; WESTERN ELECTRIC CO. (Woodward for W.E. Co., U.S.A.) [Switches] 6,162/14; BETULANDER AUTOMATIC TELEPHONE CO. and AITKEN [Impulse transmitters] 6,209/14; OLSSON and PLEIJEL [Duplex and multiplex telephony] 22,133/14.

Traction: WOLFF (Fielding) [Signalling] 5,321/14; SHEPARD and McKECHNIE [Automatic braking] 5,869/14; ELECTRIC & ORDNANCE ACCESSORIES CO. and ETCHELLS [Vehicle lighting and heating switches] 6,180/14.

Miscellaneous: WAUCHOPE and STOHTERT & PITTS, LTD. [Safety devices for electric winding mechanism] 8,286/14; FOURNIER d'ALBE [Apparatus for reading by the ear] 10,368/14; GILES [Condensers] 10,895/14; DU BOIS [Electrical egg-testers] 12,804/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Arc Lamps, &c.: PLANIWERKE A.G. FÜR KOHLENFABRIK [Negative carbon for heavy currents] 15,485/14.

DYNAMOS, MOTORS, &c.: VULCAN WERKE HAMBURG & STETTIN A.G. [Motor control] 12,048/14.

Miscellaneous: RICHARD-GINORI [Insulators] 3,369/15.

Opposition to Grant of Patents

24,755/13. Insulators. F. HANDCOCK. The appeal against the Comptroller's decision to allow the grant of a patent on this application, in spite of opposition, has been withdrawn. The specification describes a tool for boring holes in porcelain insulators during manufacture.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

6,947/01. Overhead Conductors. C. DE KANDÓ. Suspension of overhead contact lines for electric railways in which springs or other devices are provided to take up slack and keep a constant tension on the wire under varying temperature.

7,224/01. Lead Covering for Cables. E. A. CLAREMONT and J. STRATTON. Improvements in the construction of dies and cores for lead presses.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: J. STRATTON and E. A. CLAREMONT [Cable connector] 26,796/08.

DYNAMOS, MOTORS, AND TRANSFORMERS: HARLÉ & CIE [Motor control] 28,164/09.

Electrochemistry and Electrometallurgy: J. M. BAUDOT [Electrolytic treatment of wool] 25,681/05; E. WASSMER [Electric furnaces] 28,813/09.

Instruments and Meters: E. T. R. MURRAY [Maximum demand indicators] 28,947/09.

Switchgear, Fuses, and Fittings: B.T.-H. Co. (G.E. Co., U.S.A.) [Circuit breakers] 25,512/05.

Telephony and Telegraphy: E. W. SCHNEIDER [Telephones] 25,879/06; E. E. CLEMENT [Automatic telephones] 28,091/06; B. ROSING [Transmission of pictures] 27,570/07.

Miscellaneous: F. POWELL [Magnetic separator] 27,020/08; B. TRAUTMANN [Burglar alarms] 28,638/09; V. COURTECISSE [Number signs] 28,842/09.

The L.C.C. Power Scheme.—To fill vacancies on the L.C.C. Special Committee on London's electricity supply, it is proposed that Messrs. G. M. Gillett, H. H. Gordon, and the Hon. Gilbert Johnstone be elected. It may be remembered that after the L.C.C. decided to proceed with its Bill this session, Mr. H. H. Gordon, who has been so intimately connected with the Stepney electricity undertaking for many years and was strongly opposed to the scheme, resigned from the Committee.

Northampton Polytechnic.—The course of advanced lectures on "Electrical Instruments and Switchgear," by Mr. A. C. Heap, which was announced to be given at the Northampton Polytechnic Institute during the spring, has had to be cancelled, as urgent engagements caused by the war make it impossible for Mr. Heap to undertake it at the present time.

Osram Lamp Works and the War.—The employees of the Osram & Robertson Lamp Works have collected by weekly subscriptions up to now a total of £349 9s. 9d. towards the Prince of Wales War Relief Fund. Seventy-three men from the lamp works have joined H.M. Forces, and information has been received of four cases of their men being wounded. Fortunately, so far, no fatality has been reported.

Junior Institution of Engineers.—A Paper on "Electrical Heating and Cooking Apparatus," by Mr. S. M. Hills, dealing in a comprehensive way with radiators, &c., cooking apparatus, and water heaters, will be read at a meeting of the Junior Institution of Engineers on Monday, April 12th. Tickets can be obtained from Mr. A. Clifford Swales, secretary, 39 Victoria Street, S.W.

EXTENSIONS AT IPSWICH

EXTENSIONS to the electric supply system of the Ipswich Corporation have recently been completed and put into operation, whereby the whole of the eastern district of the town, which is largely residential, has been provided with an electric supply from 4-wire 3-phase low tension mains, at a pressure of 400 volts between phases, or 230 volts from any phase to neutral. 5·2 miles of main have already been laid. The district is supplied from two brick-built static transformer sub-stations, which are fed from duplicate 3-phase feeders at 3,000 volts. On their way to the eastern district, the duplicate feeders, which are each 2·75 miles long, are looped into a rotary converter sub-station in the foundry district, designed to supplement the existing continuous current supply to the consumers in that neighbourhood. The 3-phase supply at the power station is at present provided by a rotary converter, running inverted on the D.C. supply, and having a normal alternating current output of 312 K.V.A. As a stand-by for this, there is a 300 K.V.A. 3-phase alternator connected to one of the original Reavell tandem compound three-crank engines running at 375 r.p.m. Automatic voltage regulation is provided for on both the rotary and alternator by means of a Taylor-Scotson regulator, this being the third of that make of regulator installed at Ipswich. The two rotary converters in the foundry district sub-stations are arranged for a normal output of 250 K.W. The whole of the generating and converting plant has been supplied by the British Westinghouse Electrical Manufacturing Co., the main switchboards were supplied by the Switchgear Construction Co., of Birmingham and London, and the transformers in the static sub-stations were supplied by Messrs. Ferranti, under the supervision of Mr. F. Ayton, Chief Engineer and Manager, Ipswich Corporation Electric Supply and Tramways Department.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

"The Universal Electrical Directory (J. A. Berly's), 1915." 1,554 pp. 9 $\frac{1}{2}$ in. by 6 $\frac{1}{2}$ in. (London : H. Alabaster, Gatehouse & Co.) 21s. British and Colonial Sections only 12s.

Pitman's Shorthand Writers' Phrase Book and Guide—Civil Engineering. 88 pp. 6 $\frac{1}{2}$ in. by 4 $\frac{1}{2}$ in. (London : Sir Isaac Pitman & Sons, Ltd.) 1s. 6d. net; by post, 1s. 8d.

"A Treatise on the Theory of Alternating Currents." By A. Russell. Vol. 1. 534 pp. 8 $\frac{1}{2}$ in. by 5 $\frac{1}{2}$ in. 163 figures. (Cambridge : The University Press.) Second edition. 15s. net; abroad 15s. 8d.

"The Mathematical Analysis of Electrical and Optical Wave-motion." By H. Bateman. 159 pp. 8 $\frac{1}{2}$ in. by 5 $\frac{1}{2}$ in. 6 figures. (Cambridge : The University Press.) 7s. 6d. net; abroad 7s. 10d.

"Modern Illuminants and Illuminating Engineering." By L. Gaster and J. S. Dow. 462 pp. 9 in. by 6 in. 204 figures. (London : Whittaker and Co.) 12s. 6d. net; abroad 13s. 6d.

ELECTRIC TRACTION NOTES

At a meeting of the Birmingham Local Section of the Institution of Electrical Engineers, to which members of the Institution of Railway Signal Engineers and local members of the Institution of Mechanical Engineers were invited, Mr. W. C. AfIELD read a paper on the development of main line signalling on railways. After explaining the objects of the original "block" and "lock and block" systems, and a modified "interlocking block" system, giving greater freedom in handling mixed traffic, he remarked that the weak spot in these systems was the possibility of misuse of the cancelling key. He described the leading features of ordinary semaphore, dwarf, and other signals, referring to the growing movement for the abolition of the distant signal, and the simplification of large station signal equipment by illuminated route indicators. The interlocking of levers and actuating mechanism was then dealt with, and the tablet and staff systems for single-line working were described, together with the modifications in ordinary gear required for reversible working. Coming to more modern developments, the author said that, although train stops were satisfactory for electric traction at moderate speeds, it was in-

creasingly difficult to design such apparatus as the speed increased. He suggested that the solution of the problem lay at present rather in cab signalling. The most important recent innovation was track-circuiting, the possibilities of which for effecting all kinds of interlocking were enlarged upon. Various matters were dealt with under the heading of prevention of accidents, including special methods of protection of trains detained at signals. The author described the general principles of an automatic train control and audible cab-signal system, and also referred to the Kramer "Railophone" inductive signalling system. The main features of semi-automatic and fully-automatic signalling were described, the latter being preferably of the "normally clear" rather than the "normally danger" type. The author was strongly in favour of the use of upper quadrant three-position signals, and among other recent developments mentioned the use of yellow instead of red lights for distant signals. Finally, he discussed methods of power signalling, including the electro-pneumatic, low-pressure pneumatic, and all-electric systems, comparing the check, lock, and constant detection systems of indicating that the desired movements have been accomplished.

H.M. Treasury has indicated that it is unable to consent to Clause 25 of the L.C.C. (Tramways and Improvements) Bill, which authorises an expenditure of £271,900 for tramway extensions. The Council are urged to postpone, as far as possible, all new capital expenditure, and to limit expenditure, as far as possible, on works already in progress.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

An article in the *Sweizerische Elektrotechnische Zeitschrift* deals with the danger from sparking from wireless telegraph apparatus in balloons. The matter is discussed from several aspects, and finally the following precautions are recommended. The sending apparatus must be such that no open sparking is produced by the wave generator. In view of possible brush discharges from the ends of the antenna, the ends of the upper part of the antenna must be kept as far from the body of the balloon as possible, and an upper antenna of very considerable capacity is advisable. Undamped waves are preferable to strongly damped waves, as they do not entail such high voltage in the antenna. All leads in connection with the antenna must be carefully coupled up so that no contact can cause sparking by working loose. In order to prevent surges, all metal framework of the airship should be connected to the antenna, and there must be no sharp corners likely to produce brush discharges. The sending apparatus must, in no case, be used when gas is escaping from the balloon during descent.

The directors of Marconi's Wireless Telegraph Co. have issued a statement in which, after notifying a dividend of 7 per cent. on the cumulative participating preference shares, it is stated that no interim dividend can be declared on the ordinary shares owing to practically all the Company's business now being on behalf of the Government, and the question of compensation not having yet been settled. The new direct public service with New York, which had been expected to be opened last summer, has necessarily had to be postponed.

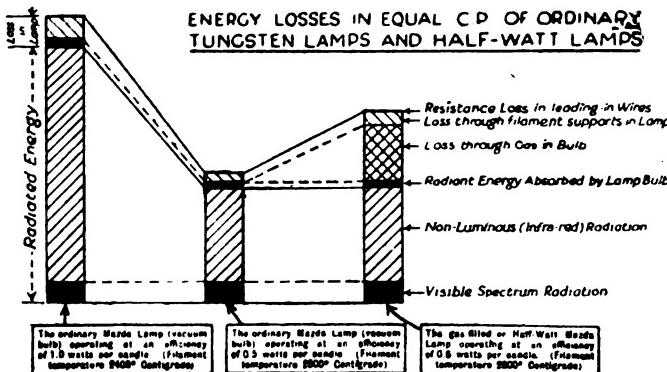

At the annual meeting of the Automatic Telephone Manufacturing Co. last week, Mr. James Taylor said that the four exchanges at Epsom, the G.P.O., Simla, and Cordoba (Argentina), continued to give every satisfaction. Exchanges had recently been completed at Rosario and Accrington. The company has also in hand exchanges for Leeds, Newport, Blackburn, Chepstow, Paisley, and Portsmouth, all of which are in an advanced state of progress.

An action against Marconi's Wireless Telegraph Co., by Mr. J. W. Hamilton, has just concluded in the High Courts. It was to recover damages for alleged wrongful termination of a contract by which Mr. Hamilton was appointed sole agent for the Marconi Co. in Australasia for a period of three years. The case lasted some three weeks, and Mr. Justice Avory, in his summing-up, referred to it as "a most wearisome case," and one "possessing no feature of human interest." The Company justified the termination of the contract, and counter-claimed for damages, but in the end, judgment was entered for Mr. Hamilton for £2,640. There will probably be an appeal.

Telephone communication has been established between Johannesburg and Kimberley, a distance of 810 miles at a charge of 2s. 9d. for a three-minutes' conversation.

ENERGY LOSSES IN INCANDESCENT LAMPS

THE accompanying diagram gives an interesting comparison of the efficiencies of half-watt (gas-filled) and other metal filament lamps. The columns show the losses occurring in the ordinary vacuum lamp when worked at an efficiency of one watt per candle and at 0·5 watts per candle as compared to the losses in the gas-filled or half-watt lamp at an efficiency of 0·6 watts per candle. This diagram was recently presented in a paper before the Chicago Engineering Society by Mr. S. E. Doane. The vacuum lamp, when worked at an efficiency of 0·5 watts per candle, shows smaller losses than the gas-filled lamp, due to the energy loss in the gas employed in the gas-filled lamp. As is well

known, however, the ordinary metal (vacuum) lamp, worked at such an efficiency as 0·5 watts per candle, would give only a life of a few hours. On the other hand, the gas-filled (half-watt) lamp is able to work at this high efficiency with satisfactory life, because of the neutral gas with which the bulb is filled, which prevents volatilisation of the filament. Energy losses due to the inert gas in the gas-filled lamp are, of course, unavoidable, but in spite of these losses, the diagram shows that the gas-filled or half-watt lamp makes a marked advance in efficiency over the ordinary vacuum lamp as used commercially.

CATALOGUES, PAMPHLETS, &c., RECEIVED

LOOM MOTORS.—A descriptive price list of three-phase squirrel-cage induction motors for the individual drive of looms has been issued by the British Thomson-Houston Co., Ltd. (Rugby). These are of the fully-enclosed type, with ball bearings, and are hinged to their base plates and provided with a spring regulating the belt tension. A special form of enclosed starting switch, built on the lines of a drum-type controller, is made for use with these motors. Six sizes are standardised,

• from $\frac{1}{2}$ to $1\frac{1}{2}$ h.p.

FITTINGS FOR HALF-WATT LAMPS.—A leaflet from Engineering & Arc Lamps, Ltd. (Sphere Works, St. Albans), illustrates a number of fittings for half-watt lamps made entirely at the St. Albans works. A very comprehensive range is included suitable for street, railway, works, or shop lighting. These fittings appear well designed and substantial, and a point worth noticing is the way in which the globe is carried on a cast-iron ring, having a wide hinge so that only one hand is required to open and to close the fittings. Some of the fittings carry hexagonal lanterns instead of globes. Internal cut-outs and substitutional resistances are arranged, and can be provided so that arc lamps can be replaced without alteration to the wiring.

SMALL AUTOMATIC TELEPHONE EXCHANGES.—In our issue of February 26th, 1914, in describing the automatic telephone exchange system of Siemens Bros. & Co., Ltd. (Woolwich, S.E.), we referred to the small automatic switchboards designed for village exchanges which the firm was then developing. These, as mentioned in ELECTRICAL ENGINEERING, February 18th (p. 73), are to be tried in six villages by the Post Office. A pamphlet describing the system has now been issued by the firm.

VACUUM CLEANERS.—We have received from Gillespie & Beales (Amberley House, Norfolk Street, Strand, W.C.) leaflets relating to the "Nilfish" electric suction cleaner, which has several special features. It is a neatly designed, portable machine which stands on the floor and works with a hose, and has the dust bag enclosed within a cylindrical case, in the upper portion of which is the high-speed motor with its two-stage turbine fan. A particularly large volume of air is swept through, which clears away more dust for the power exerted than do machines employing a higher vacuum with less flow of air. The outfit weighs 35 lbs. and consumes 300 watts.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Aldershot.—The Electricity Department requires a 400 kw. D.C. turbo-generator, water-tube boiler, and water softening plant. Borough Electrical Engineer. May 4th.

Basingstoke.—Sanction has been received from the L.G.B. for the laying of a cable to supply Messrs. Thornycroft & Co. with 250,000 units per annum.

Bedford.—A new sub-station is to be constructed.

Bristol.—Twelve months' supply of electric lamps for the Docks. Engineer, 19 Queen Square.

Haslingden.—Sanction has been received for carrying out certain important works in connection with the electrical undertaking, for which borrowing powers of £12,000 were recently sought.

Llandudno.—The L.G.B. having refused to sanction a loan of £2,000 for new plant, the Council has decided to proceed with the scheme nevertheless, and to pay for the plant out of reserve.

London: Battersea.—The Treasury has consented to a loan of £5,000 for meters.

Hampstead.—A number of rubber services are to be renewed with lead-covered armoured paper-insulated cable. The work is to be spread over three years and the cost met out of reserve.

Hammersmith.—The Treasury has consented to a loan of £10,000 for electrical extensions.

Ripon.—Mr. G. Wilkinson, the Harrogate Borough Electrical Engineer, is preparing a report upon an electric lighting scheme.

Sheffield.—An inquiry was held yesterday concerning a loan of £85,400 for electrical extensions.

Wiring

Barnet.—The North Metropolitan Electric Power Distribution Co. is to supply electricity for the infirmary for a period of seven years at 1d. per unit plus a standing charge of £50 per annum.

Bingley.—Wiring of Victoria Hall. Mr. Hopewell, 62 Main Street.

Rhondda.—Eighty-eight lighting points at the Council's offices. Borough Electrical Engineer. April 17th.

Salford.—Church of Ascension, Broughton.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Runcorn.—Additions to hospital. Mr. Wilding, Town Hall.

Smethwick.—Considerable additions to Smethwick and Oldbury Joint Hospital. Borough Surveyor.

Stoke-on-Trent.—County Mining Institute. Director of Education, Stafford.

Miscellaneous

Australia.—The Deputy Postmaster-General, Melbourne, requires 200 telephone transformers.—Motor equipments and magnetic brakes are required by the Hawthorn Tramways Trust. Further particulars in both cases at 78 Basinghall Street, E.C.

Batley.—Twelve months' supply of stores. Borough Electrical Engineer. April 7th.

Blackburn.—Electrical instruments are required at the County Asylum, Whalley. Steward.

Bradford.—Tramcar trucks, motors, controllers, and automatic circuit breakers are required by the Tramways Department. Tramway Manager. April 17th.

Stirling.—Owing to the difficulty of obtaining arc lamp carbons, the Borough Electrical Engineer has reported upon the replacement of the whole of the arc lamps, sixty in number, by half-watt 600 c.p. incandescent lamps. He puts the cost at £168, but estimates that there will be an economy in current and carbons of between £80 and £90 per annum. The work is to be carried out and the expense charged to revenue.

Siemens Rifle Club Social Evening.—The present season's membership of the Siemens Dalston Miniature Rifle Club forms the record since its inception, and some twenty-three past members of the Club are now serving with the Forces. A social evening was held at Mozart House on Friday last, under the auspices of the Club, and was enjoyed by a party of about 150 members and friends. Mr. A. E. Holmes distributed the medals and spoons won during the current half-season. Vocal and instrumental items were interspersed with dancing, and the success of the evening is largely due to the efforts of Mr. F. S. Dennison, who acted as Hon. M.C.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Barking.—The recommendation of the Acting Electrical Engineer to purchase a Ljungstrom turbine (Brush Electrical Engineering Co.) has been adopted.

Bootle.—The following tenders have been accepted:—Cables and stoneware troughing, Callender's Cable and Construction Co.; meters, B.T.-H. Co. and Reason Manufacturing Co.; fuse boxes and terminals, British Insulated & Helsby Cables, Ltd.; oils, Vacuum Oil Co.; bitumen and compound, Trinidad Lake Asphalt Co.; service boxes, E. Wilson & Co.; electric globes, General Electric Co.

Manchester.—A contract has been placed with Messrs. Chamberlain & Hookham for a twelve months' supply of tramcar meters.

APPOINTMENTS AND PERSONAL NOTES

Mr. James Bird, at present Deputy Clerk to the London County Council, has been appointed to succeed Sir Laurence Gomme as Clerk at a salary of £1,600 rising to £2,000 per annum.

The late Mr. J. F. Albright, Chairman of the British Electric Transformer Co., left estate valued at £33,854, of which the net personalty is £32,601.

The late Mr. W. Bullock, Manager of the Electric Construction Co.'s Works, left estate of the gross value of £6,883, of which £6,630 is net personalty.

Particulars appear in our advertisement columns of a number of central station and other appointments.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £76 to £76 10s. (last week, £74 10s. to £75).

Australian Agency.—An agent in Melbourne desires to represent United Kingdom manufacturers of electric cranes. Further particulars at 73 Basinghall Street, E.C.

London Office.—Parmiter, Hope & Sugden (Hulme Electrical Works, Manchester) have opened a London Office at Queen Anne's Chambers, Westminster, under the direction of Messrs. Nathan & Allen, where samples of their new "Fluvent" fuse system may be seen.

LOCAL NOTES

Bexley: New Plant.—A 500 kw. Westinghouse turbo-generator, the turbine being of the Rateau type, was put into service at the electricity works last week. In conjunction with this set a Stirling water-tube boiler has been installed. This scheme of extensions has been carried out under the supervision of Mr. H. P. Stokes, the Borough Electrical Engineer.

Canada: Ontario's Electrical Development.—The Ontario Hydro-Electric Commission is now supplying current in bulk to three towns, 102 municipalities, and some 800 rural in-

dustrial enterprises. The quantity of electricity distributed amounts to 100,000 h.p. The Chairman of the Commission (Sir Adam Beck) recently stated that the Province of Ontario will soon have 1,000 miles of State-owned electric railways.

Edinburgh: The I.M.E.A. Conference.—The recommendation of the Electricity Committee that Bailie Stevenson and the City Electrical Engineer be sent to the I.M.E.A. Conference in June was opposed by Councillor Robertson. The expense involved was characterised as extravagance, but on a vote the recommendation was agreed to by 20 votes to 12.

Ireland: Water-Power Electricity.—It is stated that a scheme of some magnitude for generating electricity by water power in Ireland is in contemplation. The waters of Lough Erne and the Shannon are referred to. Presumably the scheme is on the lines of the large power companies in this country, for it is stated that a power station at Limerick could supply electricity for Dublin and the southern half of Ireland, but that there will be no competition with existing undertakings. A capital of between one and two million pounds is mentioned.

Kingston: Chairman's Resignation.—In consequence of the Council's decision to impose a 10 per cent. increase on all classes of consumers instead of an increase of from 5d. to 6d. in the flat rate for lighting purposes, as recommended by the Electricity Committee (see ELECTRICAL ENGINEERING, March 25th, p. 136), the Chairman of the Electric Lighting Committee has resigned, says the *Surrey Advertiser*.

London: Poplar.—It is announced that there will be a reduction in the charge for private lighting from 4d. to 3d. per unit as from the end of March.

Stoke Newington: Loan Sanctioned.—The Treasury has sanctioned loans of £3,000 for mains and £1,000 for meters. It appears that this amount has already been spent without approval, and the Treasury has only given its sanction on the assurance of the Borough Council that no further capital expenditure will be incurred during the war which is not really necessary in the national interests.

Worcester: Loans.—An inquiry was held last week concerning loans of £5,250, £1,973, and £850 for the electrical undertaking. Naturally the question of the Treasury consent was raised, and Mr. H. R. Hooper, the Inspector, intimated that the application for £4,000 of the first-named sum required for mains must be withdrawn. He emphasised, as we have already pointed out in our columns, that the ordinary developments of the undertaking must wait until after the war. There is a sum of £838 over expenditure on mains and £116 over expenditure on sub-station equipment. These items are to be the subject of a special report to the L.G.B.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

North Metropolitan Electric Power Supply Co.—A dividend of 6 per cent. and a bonus of 12s. per share is declared on the ordinary shares for 1914, after placing £2,000 to reserve for redemption of debentures and £1,624 to depreciation, making the latter £100,000. The carry forward is £4,677.

British Aluminium Co.—The year 1914 was the best in the records of this company, notwithstanding the difficulties introduced by the war. A dividend of 5 per cent. less tax is paid on the ordinary shares.

British Insulated & Helsby Cables.—Dr. E. K. Muspratt, the Chairman, at the annual meeting last week, stated that although the company had had a very busy year and had made £30,000 more profit than in 1913, this was not due to orders for war supplies. Business with neutral countries had expanded very considerably, and the unexecuted orders on hand at the present time were more than ever before. In view of the prosperous position the sum of £25,000 has been set aside for the formation of a pension fund.

Brush Electrical Engineering Co.—At the meeting on Monday the report and accounts given in our last issue were adopted. Mr. E. Garcke, who presided, said that the directors would have been perfectly justified in declaring a moderate dividend on the ordinary stock, but they felt that war time was not one for a company which had only just emerged from a long period of depression to begin the payment of dividends.

British Westinghouse Co.—At the meeting on Monday the Chairman, Mr. J. Annan Bryce, warned the shareholders against any anticipations of large profits from war contracts. Such contracts were by no means profitable. The satisfactory result of 1914 was, he said, due entirely to contracts entered into before the war, but there was a prospect of the company being adversely affected in the future owing to the war. He anticipated a period of general industrial depression after the war.

All letters to be addressed to "Electrical Engineering," at the EDITORIAL AND PUBLISHING OFFICES: 203-206, TEMPLE CHAMBERS, LONDON, E.C.

Telegrams: "Circling, Fleet, London." Telephone No.: 5509 Holborn

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

SUMMARY

DR. LEWIS JONES, the well-known specialist in electro-therapeutics, died on Sunday (p. 149).

WE publish some further letters from central station engineers regarding the restriction of electricity works extensions (p. 150).

THE conditions to be contended with in connection with telephony in the tropics were discussed at the last meeting of the Institution of Electrical Engineers, in connection with a paper by Mr. W. Ll. Preece (p. 151).

A NEW form of rectifier for obtaining high tension direct current consisting of a vacuum bulb with heated cathode has been developed in America (p. 152).

A SCHEME is on foot for the formation of an Engineer Volunteer Training Corps by the Institution of Electrical Engineers (p. 152).

MR. G. WILKINSON writes to correct a misapprehension which might arise from remarks in a contemporary regarding his contribution to Mr. Cooper's paper on electric cooking (p. 152).

A CORRESPONDENT suggests a scheme whereby skilled amateur craftsmen might be employed in making munitions of war (p. 152).

A NUMBER of technical books are reviewed (p. 153).

A PAPER on intercommunication telephones was read at the last meeting of the Association of Supervising Electricians (p. 154).

A FURTHER hitch has occurred in the negotiations for the purchase of the Bristol Tramways by the Corporation (p. 154).

THE running of a motor at very much reduced speed is discussed in our "Questions and Answers" columns (p. 155).

AMONG the subjects of specifications published by the Patent Office last Thursday are selective signalling, arc lamp suspension, oil circuit breakers and apparatus for enabling the blind to read (p. 156).

OUR Trade Section contains articles on electrical driving of paper-making machinery, electrically worked gates, and glassware for obtaining illumination approximating to daylight (p. 157).

AN expenditure of £164,373 is contemplated at Sheffield mainly to deal with Government work; a loan of £6,400 has finally been sanctioned at Heywood; cable is required in New Zealand and Australia; the West Ham Council is utilising £16,863 from reserve for extensions, and a loan of £18,000 is contemplated by the Barking Council (p. 158).

THE increase in charges for electric lighting in London has been questioned in the L.C.C.—Increased charges for electric supply, owing mainly to higher cost of coal, are notified in a number of provincial towns.—The Manchester Corporation is persisting in its endeavours to obtain sanction to the loan for the Barton power scheme (p. 158).

For arrangements for the week, see page vii.

OBITUARY

HENRY LEWIS JONES.

DR. H. LEWIS JONES, the authority on medical applications of electricity, died at his house in Harley Street on Sunday after a long illness. He was fifty-eight years of age. Dr. Lewis Jones was in charge of the electrical department at St. Bartholomew's Hospital from 1891 to 1912, and on his resignation was appointed a Governor of the Hospital and Consulting Medical Officer to the Electrical Department. He was elected to a Fellowship of the Royal College of Physicians in 1894. In 1900 he read a Paper on "The Applications of Electricity in Medical and Surgical Practice" before the Institution of Electrical Engineers, and he acted as official delegate for the British Government at the International Conference of Physical Therapeutics at Liège in 1905 and in Paris in 1910. Dr. Lewis Jones's book on "Medical Electricity," which has run through many editions, is the standard work on the subject. His death is a great loss to the profession.

Electrical Labour Troubles.—Although the underground railway companies in London came into line with the other companies and granted the war bonus of three shillings per week, the engineers and mechanics have declined to accept it. They ask that the increase shall be permanent in view of the increase granted in London in November by the Engineering Employers' Federation. April 10th has been fixed as the date for striking.

The electrical employees of the Port of London Authority also threaten to strike on April 14th unless they are granted one shilling per hour and a 48-hour week.

THE RESTRICTIONS ON ELECTRICITY WORKS EXTENSIONS

WITH reference to our articles on this subject (*ELECTRICAL ENGINEERING*, March 11th and 25th and April 1st), we now publish extracts from some further letters which we have received from central station engineers:—

Hampstead.—Mr. W. Wyld writes: Fortunately for us we had a few months ago obtained the L.C.C.'s sanction to the borrowing of £17,300, so that we are not at the moment affected. Owing, however, to the present tightness of the money market, we are having to pay very heavy interest on the loans. I quite agree that with things in their present condition of reduced outputs and approximately 50 per cent. increase in the price of fuel, and the prospect of 1-watt lamps in small sizes at an early date, every care should be taken to build up the reserve fund rather than allocate profit to the relief of the rates. Where satisfactory reserve funds have been built up, it would certainly be advantageous to use these at the present time for necessary extensions.

Plymouth.—Mr. E. G. Okell writes: I do not anticipate that the refusal of the L.G.B. to grant loans for extensions will seriously affect the Electricity Department of the Old Plymouth area at the present time. It has been the practice for some years past to pay for all low-tension mains extensions, for services, electricity meters, &c., out of net revenue, also sundry high-tension extensions have been carried out under the reserve fund; no capital has been borrowed for these purposes for some years.

Ipswich.—Mr. Frank Ayton writes: As we have just completed a comparatively large extension, including the installation of three-phase plant, and a four-wire three-phase distribution for the Eastern District of the town, it is improbable that we shall be launching out on any further extension work for many months. I quite agree that for any future extension work it is desirable to utilise one's reserve fund, but, unfortunately, ours is not of a large amount, although we have so far made a firm stand against any allocation of profits of the Electric Supply Department to the relief of rates. In my opinion, the Treasury restrictions upon capital expenditure by local authorities must necessarily have a serious effect upon the progress of the electric supply undertakings in general, although the effect will not be immediately felt. At the same time, I do not think that anyone should complain, as the main aim at the present time should be a victorious termination of the war for ourselves and our Allies.

Coventry.—As mentioned in our last issue (p. 136), a loan of £46,932 for extensions was sanctioned quite recently. Sanction was given without the holding of the usual L.G.B. inquiry; the bulk of the electricity is to be used by firms engaged on Government contracts. Mr. George Tough writes us that he is quite in agreement with our suggestion as to the utilisation of reserve funds. The Coventry accounts for last year show that, in addition to amounts written off for obsolete and superseded plant (now totalling £29,365), there had been, up to date, a further amount of £22,488 transferred to the capital account for the purchase of new plant, and this was increased by a sum of £13,250 out of last year's profit, and spent on house services, sub-station equipment, cooling towers, and street mains for the future.

Wolverhampton.—Mr. S. T. Allen writes: I think that this is an occasion for utilising reserve funds as far as possible for extension work if it can be clearly realised that those reserve funds should be again built up as soon as possible out of the profits of the undertaking. With regard to the allocation of profits to rate relief, I certainly think that now is an opportune time for some definite statement on the part of the Local Government Board on the matter. The Local Government Board Inspectors have from time to time been very definite in their remarks relating to the allocation of profits, and in several cases have condemned, as far as they were able, the practice of allocating so-called profits to rate relief before adequate reserve or depreciation funds have been built up. The condition of things with regard to labour and cost of material on account of the war have shown us all the great wisdom of building up adequate reserve funds, and I feel that some definite pronouncement on the part of the Government would be welcomed by many Councillors who have to meet ratepayers in November, and who could, with thankfulness, wash their hands of what must be to many an uncomfortable task, that is the promise to press for rate relief from trading undertakings which have no full reserve or depreciation funds built up. I think the precedent has already been established by the Government departments in connection with Provisional Orders such as that of the Potteries Amalgamation a few years ago, when it was stipulated, I believe, that the prices should be so regulated that after full allowance had been made for expense, depreciation, and reserve no net profit should be made. The benefits of such an Order, if it could be made general, would be enormous, both to the undertakings and to the ratepayers. So far as the Wolverhampton Undertaking is concerned, the reserve fund amounts to approxi-

mately 50 per cent. of the amount permitted by statute, and has not suffered so much by transfers to the relief of rates from profits as other undertakings. Further, it is the practice to meet expenditure of a capital nature, such as services, meters, &c., out of reserve fund. Notwithstanding this, yearly amounts of £1,147 to £2,125 have been so transferred during the past eight years.

Basingstoke.—Mr. George Broadhurst writes: As this undertaking has only been running for six months, we have, of course, no reserve fund. We are at the present moment requesting the sanction of the L.G.B. for a loan, but as this is to supply a firm which is engaged on war supplies, we hope there will be no difficulty.

West Ham.—Mr. J. W. Beauchamp writes:—I quite agree with you that a good opportunity is presented for utilising reserve funds where they exist, and in spending revenue surplus on permanent works. Beyond that I do not think that the action of the Local Government Board need be taken too seriously. In most supply undertakings there is a large amount of business to be obtained along the routes of existing mains, therefore canvassing, instead of being general can now be made special, and directed to securing business where that can be done with a minimum of capital expenditure. The question of the employment of joiners and men connected with mains extension is hardly a serious one, as there is a brisk demand for that class of labour, and electricity departments would probably already have lost many such employees but for the fact that the latter prefer to keep a permanent job if possible. I do not anticipate that the Electricity Department in West Ham will be appreciably affected by the restrictions proposed, as new power business obtainable in the district is generally of such a character that a good case can be shown for borrowing for it if necessary.

Harrogate.—Mr. G. Wilkinson informs us that he has been refused sanction for a loan for service cables and transformers, and is recommending his Committee to set aside a sum out of this year's profits (which are double the estimated amount) for them.

Stoke-on-Trent.—Mr. Chas. H. Yeaman informs us that when the electrical undertakings in the present Borough were combined exactly a year ago, Hanley came in with about £2,200 reserve fund, but the three D.C. undertakings came in with an aggregate loss of about £4,400, so that there is no reserve fund available. Some extensions in prospect before the war are not to be proceeded with.

Derby.—Mr. T. P. Wilmshurst writes:—I consider that in this crisis we have no option but to submit to the wishes of the Treasury. Fortunately we have recently completed large extensions of our plant, and intend to connect up any new consumers to our existing distributors, charging the cost to revenue account. The normal growth of business must of necessity be checked and mains construction staffs must in some cases be dispensed with temporarily. There is, however, a great demand for labour of all kinds, and through the agency of the local Labour Exchange we have just sent off a party of pick and shovel labourers to Salisbury Plain to make roads, &c. I may add that the terms offered are very attractive. Where motors are required for hire purposes and the Supply Authority has not the necessary reserve fund, arrangements might be made temporarily for the makers to hire the motors to the Supply Authority, who could purchase outright at the termination of the war. I am opposed, at this and any other time, to using surplus profits for the relief of the rates while money is at the same time being borrowed for the carrying on of the undertaking.

Westinghouse Smoking Concert.—About thirty members of the Headquarters Supply Department staff sat down to supper at the Exchange Hotel, Manchester, on Monday of last week. Afterwards there was an excellent smoking concert, at which Mr. J. Gibson (Manager of the Supply Department) presided, fifty members of the Supply Staff and a few specially invited guests being present. During the evening the Chairman referred to the continued prosperity of the Supply Department, the turnover of which in twelve months had increased about 30 per cent. He missed several old faces in the gathering, particularly that of his Chief Assistant, Mr. G. Ellam, who had been away many months in Russia. During the evening the following toasts were enthusiastically honoured:—"The King," proposed by Mr. J. Gibson; "His Majesty's Forces," by Mr. L. E. Wilson; "The Westinghouse Co.," by Mr. W. S. Robson, the latter being responded to by Mr. W. J. Hollick; "Our Visitors," by Mr. A. Pouger, responded to by Mr. L. E. Wilson; "Our Chairman," by Mr. H. H. Bent, responded to by Mr. J. Gibson. The following artists rendered yeoman service in entertaining the company:—Messrs. A. Pouger and T. Jackson as pianists, Mr. A. Pouger (hautist), Mr. T. E. Kenyon (humourist), Mr. T. Clough (elocutionist), Mr. O. C. Oakley (baritone), Mr. W. S. Robson (violinist), Mr. McColl (humourist), Mr. F. Freeman (elocutionist), Mr. D. E. Elliott (Newcastle dialect recitation), while the "Inharmonious Four" caused great merriment by their vocal efforts.

TELEPHONE TROUBLES IN THE TROPICS

M R. W. LL. PREECE read a paper on this subject before the Institution of Electrical Engineers on Thursday, March 25th, and laid particular stress on the variations necessary before applying ordinary home practice to telephone systems in tropical regions.

Taking the case of instruments first, he said that teak prevented the ravages of white ants, but there were other insect troubles. An instrument was shown which some bee-like insects in Nigeria had made a hive of, entering through the slot for the switchhook, and actually forming a comb inside and reforming it several times after it had been completed. Spiders' nests in telephone cases were also not uncommon. As a preventative the switch-hook should carry a brass plate to keep the slot entirely covered. It is also desirable to have no terminals above the instrument, but to take the conductors through holes, which are subsequently sealed up. The internal wiring should be made as simple as possible, and not bunched but well stapled to the body of the instrument in separate ways. In subscribers' instruments (although not always in exchange instruments) enamel insulation with a silk covering is suitable. Some ebonite receiver sheaths in the West Indies had softened from the heat, and of course this is remedied by using blocked brass sheaths covered with enamel. In another tropical country, the insulating block carrying the contact springs in a capsule transmitter, became so warped by the damp heat that both springs short-circuited on the metal case. Faults in subscribers' instruments due to lightning are few, and may be avoided by fixing the protector at the point where the wires enter the house. In cases where the protectors had been fixed near the instrument, buildings had been frequently set on fire; several cases having occurred in the telegraph offices of Northern Nigeria. Many faults were also due to misuse of the instrument by the subscriber himself, and one case was mentioned where the mouthpiece of a hand set had been habitually used as a cigarette ash-tray.

The choice of the exchange switchboard system, Mr. Preece considered, must be largely affected by the difficulty of maintaining satisfactory insulation on overhead lines in the tropics, owing to the moist heat, so that the pressure of 24 or 40 volts required for the central battery system was to be deprecated unless underground mains were possible. At Port of Spain, Trinidad, a central battery system had been found unsatisfactory, and the more distant subscribers had had to be connected to a separate magneto board. On the other hand, in Havana, Cuba, he understood that an automatic system was giving satisfaction, but he had not personally inspected it. On the whole, therefore, he was entirely in favour of a magneto system either with mechanically restored indicators, or incandescent lamps controlled by relays. Trouble had, however, been experienced with enamelled wire windings on the relays owing to the damp atmosphere acting on the copper if there was the slightest defect in the enamel. Certain mechanically restored indicators, especially the eye-ball type, had given trouble, the steel pins on which the eye-balls were mounted were apt to rust, and, in fact, Mr. Preece regarded it as essential that any iron or steel must be galvanised or otherwise coated.

There is also trouble, he said, in obtaining suitable operators in the tropics, the climate usually renders it impossible to employ Europeans, and lack of ability, early marriage, or form of religion, makes native operators unsuitable. Sixty to eighty lines per position are all that can be handled as a rule, so the telephone department long for a simple automatic system. Mr. Preece then described a simple magneto board with lamp indicators and automatic clearing, which was now used in the Malay States.

There are also many line troubles peculiar to the tropics. In some parts it is not unusual to have a mile or two of lines wrecked by giraffes, elephants, or monkeys. The giraffes roaming over the wilds of East Africa, come against a telegraph or telephone line, and instead of drawing back or ducking their heads, they push on and sometimes carry the wires and poles with them. In the best practice the poles are either of wrought iron with taper tubes and cast-iron bases, or of the Hamilton type, built up of tubes of riveted sheet steel. In most places the white ants render wooden poles impossible, on the other hand wooden arms can be used, as the ants will not work their way up the iron tube to reach them. Where hard wood is not obtainable, tubular iron arms are employed, carrying six, eight, or twelve Cordeaux porcelain insulators on iron stalks. The insulation of all lines is very low, however, as the atmosphere has frequently a humidity of 80 to 90 per cent. But the most troublesome factor is the vegetation, as it is often difficult to induce the Government to clear away the trees. The normal clearing of the roads is supposed to be 60 ft., but is not always maintained, and even with 60 ft. clearing the lines must be within 20 ft. of the trees at the best, and are often less than 10 ft. away. Unless a further 50 ft. clearance is maintained contacts and breakages due to falling trees are almost a daily occurrence. Underground lines cannot be used when sometimes the subscribers are 20 to 25 miles from the exchange. Mr. Lawson, the chief engineer in Southern Nigeria, was able to persuade

his Government that 100 ft. clearance through the forest was essential, and the result is most satisfactory.

In Java the wires are suspended on span wires attached to poles on either side or to trees, and this has been found satisfactory, although Mr. Preece suggests that there is some danger to the public. Insects on the insulators cause frequent troubles; some insects delight in making their homes between the petticoats of insulators, and Mr. Preece had seen an insulator which was covered with a spider's nest so as to be invisible. Spiders' webs formed in a single night between the wire and the insulator stalks will reduce the resistance of a line to a few ohms. The ordinary oil insulator was found useless, as the oil chamber became entirely blocked up with insects. Mr. Guthrie Spain, telegraph engineer at British Guiana, was the first to call the author's attention to the fact that insects will not enter glass insulators, and these are said to be effective in Cuba. The reason is apparently that the insects prefer a dark place for their home. The author suggests that if oil insulators of glass could be easily obtained, considerable improvement would result. Ordinary carbon block lightning protectors give trouble, practically after every storm, owing to carbon dust being carried across the gap and placing the two carbon blocks in contact. This can be avoided by using the vacuum type of protector. The author also referred to a suggestion made by Mr. J. Sayers of the Midland Railway, to protect a line from lightning by erecting an earthed line along the tops of the poles. In underground work, Mr. Preece thinks that the practice hitherto followed of making the joints so that dry air can be periodically pumped through, is unsuitable for the tropics. He says that once the damp has entered the cable, no amount of pumping will drive it out completely, and the length has to be replaced. The tapped plugged holes as air inlets for the pumping are also, he says, possible inlets for damp. He suggests that solid joints should be made, as in America, and that the cable should be well sealed with paraffin wax immediately it is open for jointing. In Shanghai there is a curious flying insect which is able to bore holes in which to lay its eggs in the lead covering of overhead cables, but the author knows of no case in a tropical country where an insect has damaged an armoured lead-covered cable.

In the concluding part of his Paper, Mr. Preece referred to the staff difficulties. It is too expensive to obtain inspectors, foremen and linesmen from England, as no white man can live in the tropics comfortably on less than £250 a year. This means, therefore, the employment of native labour for the lower grades of the technical staff, and it is difficult to find natives with sufficient conception of responsibility or with any power of command.

Thirteen speakers took part in the discussion, ten being telephone engineers and the remainder manufacturers. Sir John Gavey, who spoke first, gave an idea of the conditions met with in South America, where no trouble had been experienced with the staff. He did not approve of the filling of joints, but most of the other speakers did. Mr. W. W. Cook, Mr. W. Slingo (Chief Engineer to the G.P.O.), and Mr. H. Laws Webb pointed out that without details as to the size of the area or the population to be served, it was difficult to discuss the relative merits of the local battery, central battery, and automatic systems, but there was general condemnation of Mr. Preece's preference for the local battery system, Mr. Slingo suggesting that it implied that telephone engineers had made no progress as regards telephone installations in the tropics since 1867. Similarly there was a general feeling that a telephone engineer should not be too pessimistic upon the native labour question. Mr. Webb said that it had even been found possible to employ Mahomedan girls as operators in Constantinople.

The question of enamelled wires received some attention, and Mr. Slingo gave interesting particulars of the tests applied by the G.P.O. The wire must withstand an E.M.F. of 1,000 volts after having been immersed in the following solutions for forty-eight hours, viz., caustic soda, sulphuric acid, nitric acid, and hydrochloric acid, and finally in potash for thirty-five minutes. Opinions, however, were somewhat divided as to the suitability of these wires, trouble being experienced in obtaining a perfectly even layer of enamel in manufacture. The Post Office has also experimented with glass insulators, and several specimens were shown, made in France and Germany respectively, but the manufacture of insulators similar to the German ones is now being undertaken in this country. It has a basis of asbestos, and is claimed to be unbreakable either by stones or bullets.

As to the automatic exchanges, one has been erected at Simla and has proved efficient and satisfactory. Mr. Preece's doubts as to the Havana automatic exchange elicited from Mr. H. H. Harrison that there had been a phenomenal growth in the number of telephone subscribers there since the introduction of the system, and that every satisfaction is being given in spite of a troublesome climate.

Mr. R. W. Weightman and Mr. G. McAlpine called attention to the varying conditions in the tropics, so that one class of apparatus was hardly likely to be generally applicable. In the high lands the conditions were extremely dry, whilst on the coast quite the opposite obtained, lines, insulators, poles, &c., often being covered with damp salt. Mr. McAlpine, who has

had experience in Ceylon, has found iron wires impossible, and that 400-lb. copper wire is essential. Copper-clad steel wire has been found to last less than three months. The average life of a telephone instrument in Ceylon has been found to be not more than five years.

Other telephone engineers who spoke were Messrs. A. J. Stubbs, E. O. Walker, H. H. Harrison and R. Scruby. It was stated that instruments for use in the tropics require more attention than they usually receive. Mr. Scruby advocated metal casings, and called attention to the need for rounding all corners. The use of teak was generally agreed with, and also overhead cables, where possible, in preference to open wires. For poles, disused railway rails were recommended as both cheap and thoroughly suitable.

On behalf of the manufacturers, Mr. J. E. Kingsbury (Western Electric Co.), Mr. G. H. Nash (Western Electric Co.), and Mr. E. A. Laidlaw (Siemens Bros. & Co.) complained that the manufacturer was given little help by the engineer in the tropics as to what was needed. They usually were told that the apparatus would not work, and that was all, and at present, it was said, no two engineers in the tropics held the same opinions as to what was necessary.

The author, who did not attempt to reply in detail, said he had had in mind, in writing the Paper, real tropical countries such as Ceylon, India, Malay States, and Uganda. Many of the troubles referred to did not occur in the high lands, such as Nairobi. As to his preference for the magneto system, regard must be had to the size of the installations. Many were hardly deserving the name of exchange. The largest he knew was of 1,500 subscribers. There were two or three for 600, and others for 300, 100, and even 50 subscribers.

THE KENOTRON

A CONSIDERABLE amount of research has been concluded at the Research Laboratory of the American General Electric Co. on the properties of the hot cathode vacuum tube, an example of which is the Fleming oscillation valve depending on what was originally called the Edison effect. It had long been known that an exhausted tube containing two electrodes are heated by an external source acted as a rectifier, and the work of Dr. I. Langmuir, described in the *General Electric Journal*, was directed to removing the difficulties in the way of applying it practically as a high-voltage rectifier. The laws governing the quantitative action were fully investigated, and a number of forms of the apparatus, which has been named the "Kenotron," were experimented. For current-carrying capacities up to 0·5 amperes, either a cylindrical anode with a filament down its axis or a W-shaped filament between two parallel plates were found suitable. Another form, with an anode in the form of a molybdenum cap, was used with success up to 0·1 ampere and up to 15,000 volts, but for higher voltages up to 100,000 the cylindrical anode proved the best. The actual energy losses in the kenotron may be reduced to less than 2 per cent. of the total energy rectified when the tube is operated to its full voltage limit. Up to the present, kenotrons have been constructed for direct-current voltages as high as 100,000; but there is every expectation of being able to extend the field of application to 150,000 and even 200,000 volts. The maximum current rectified has been as much as 1,500 milliamperes (1·5 amperes); but it is much more convenient to construct these rectifiers in the form of 10-kw. units where the voltages required exceed 25,000. For lower voltages, smaller units are advisable. A great advantage possessed by the kenotron over the mercury vapour rectifier is that two or more units can be worked in parallel. It is considered that in the physical laboratory where small direct currents of a few milli-amperes at very high voltages are required, as for spectroscopic work, operating small discharge tubes, &c., the kenotron ought to prove exceptionally useful, as well as to produce high-voltage direct current for X-ray tubes and the precipitation of dust, smoke, &c. It is said to work satisfactorily at 100,000 cycles as at ordinary frequencies.

Benevolent Fund of the Institution of Electrical Engineers.—A special appeal is being made by Sir John Snell to elicit practical sympathy in the Benevolent Fund of the Institution of Electrical Engineers, which has been doing much good work during the last twenty-five years, but is still smaller than it should be, considering the size of the Institution. Indeed, it will surprise many to learn that the 7,000 members last year contributed no more than £87 in subscriptions and £180 in donations, and that the income from invested capital is only £175 per annum. These amounts are sadly inadequate to relieve the distress which exists within the field of operation of the Fund.

ENGINEER VOLUNTEER TRAINING CORPS

THE Institution of Electrical Engineers has issued a circular letter to members residing in the London district announcing a scheme for the formation of an Engineer Volunteer Training Corps, including members of the engineering profession who are either above military age, or who, being of military age, are prevented by some good reason from serving in the Regular or Territorial Forces. This scheme was suggested to the President, Sir John Snell, by General Sir O'Moore Creagh, V.C. (Military Adviser to the Central Association Volunteer Training Corps). The objects of the Corps, which would be affiliated to the Central Association according to the War Office conditions, would be to train men of military age to make them useful Royal Engineers recruits if and when they are able to enlist, and to furnish engineer units to assist in the completion of the volunteer organisation.

It is particularly desirable that the technical knowledge of such a Corps should be organised so as to be available at the earliest possible moment, and the units would be so constituted as to ensure that the maximum advantage would be taken of the specialised skill of their members. Instruction and training would be given in military engineering with special reference to field and fortress work (including telegraphs, telephones, searchlights, &c.), in addition to drill, musketry, and other military operations proper to an engineer unit. Drills would be arranged so that each unit would receive instruction for at least two hours per week in the evenings and on Saturday afternoons or Sundays.

Members joining will be required to provide their own uniforms and probably some part of the equipment.

ELECTRIC COOKING

IN view of some remarks of our contemporary, the *Journal of Gas Lighting*, relating to Mr. George Wilkinson's contribution to the discussion on Mr. Cooper's Institution Paper on "Electric Cooking," in which that journal implies that the electric water-heating installation to which he referred was not of sufficient capacity to ensure the cleanliness of an ordinary family, Mr. Wilkinson writes as follows:—"What I actually said was that the electrical heater has a cubical capacity equal to 12 gallons, but it is equal to an output of over 60 gallons of water per day at 100° F., which, I think you will agree, is a fair supply for a small household; it is found sufficient for two or three baths per day in addition to the ordinary kitchen requirements. I have facilities for the production of ten times this amount of hot water if necessary, but the output of the electric heater is found ample for ordinary everyday demands."

CORRESPONDENCE

SKILLED LABOUR FOR THE MAKING OF MUNITIONS OF WAR.

To the Editor of ELECTRICAL ENGINEERING.

SIR,—In view of the expressed opinions of the Leaders of the Government as to the difficulties of manufacturing munitions of war and the acknowledged shortage of labour, the Society of Model and Experimental Engineers desires to call attention to the existence in this country of the considerable amount of mechanical ability and experience possessed by people who are not professionally occupied in engineering. No doubt many of these would be willing to offer themselves for service in Government workshops if suitable conditions of employment can be arranged. As the easiest means of effecting this the Society would suggest that the Government should give its consideration to the formation of an Industrial Branch of the Royal Engineers, in which such men might enlist without having to conform to the existing military standards.

The Society is of opinion that there are a number of capable men who would willingly come forward under a scheme of this kind, as they would then feel they were part of the recognised force employed in the defence of the country. Such a proposal as this, if carried into effect, would probably also attract trained workers whose services are not at present being utilised for Government work.

I am, Sir, yours obediently,

HERBERT G. RIDDELL,
Secretary, Society of Model and Experimental Engineers.

37 Minard Road, Hither Green, S.E.,
March 31st, 1915.

REVIEWS OF BOOKS

Consumers' Accounts and Meter Department Routine. By A. G. Glover. 49 pp. 8 $\frac{1}{2}$ in. by 5 $\frac{1}{2}$ in. (London : Electrical Press, Ltd.) 5s. net; abroad, 5s. 3d.

This work is intended as a guide for those in charge of the commercial and financial departments of supply undertakings, and comprises some nineteen model forms, commencing from the receipt of the consumer's application form. While presumably designed to cover all sizes of undertakings, small concerns with a limited clerical staff will find it somewhat difficult to find the necessary time for keeping up all the forms, and for these the models might be simplified. For instance, Forms 2, 3, 4, 5, 6, and 7 all contain identical details of the number, type, size, and pressure of the meter, and similar duplications occur elsewhere which could be avoided by a simple cross reference. There is no sample shown of the "Meter Test Book," and the "Meter Fix Register" (see Form 7) might contain the date and result of the last test of the meter, as this information is useful in cases of dispute with a consumer. Form 13, Meter Readers' Report, is somewhat obscure, as a meter reader's duty usually ends with reading the meter, and does not extend to reporting on the condition of the meter. Though not specifically mentioned, the author apparently has a preference for the looseleaf ledger rather than the card system; in Form 3 there are some advantages in the meter-reading sheets being in the form of cards containing only blank clock faces, as the chances of error on the part of the reader are somewhat less. A sample of each would be an advantage. The book concludes with extracts from the Electric Lighting Acts bearing on meters and accounts. The author evidently draws from a large experience, and the book can be thoroughly recommended for those who are commencing or reorganising their commercial departments.

Electric Cooking, Heating, Cleaning, &c. By Maud Lancaster. Edited by E. W. Lancaster. 335 pp. 8 $\frac{1}{2}$ in. by 5 $\frac{1}{2}$ in. 320 figures. (Constable & Co., Ltd.) 3s. 6d. net; abroad, 4s. 1d.

A comprehensive book on the domestic uses of electricity has long been wanted, and many will welcome the present attempt to deal with the subject from the consumers' point of view. Although, of course, much of its contents necessarily partake of the nature of special pleading, and the style of writing, in parts, is that of the advertisement rather than the text-book, it is quite the most complete work of its kind, especially as regards electric cooking, that we have seen. The writer evidently possesses the authority of experience. After a slightly disjointed introduction, opening with unnecessary remarks on amber and loadstone, the subject of cooking is gone into thoroughly and the requirements studied. It is then shown how these are met by electric cooking better than in any other way, and a large variety of apparatus is illustrated and described in a manner that ought to be a great help to those choosing appliances for cooking on a large or small scale. The information is quite sufficiently technical, and an interesting feature is a collection of heating time curves for different designs of ovens. Costs and quantities are gone into for the requirements of a small family, and there is also a section on hotel cooking equipment. Other subjects treated in a similar way, but not quite at the same length, are water heating, heating of rooms, fans and ventilation, medical and other personal applications, vacuum cleaning, ironing, &c. The actual equipment of an "electric home" is described, a short glossary of technical terms is given, and a useful concluding table gives the prices charged for current for heating in different places.

Electric Mine Signalling Installations. By O. W. Lummis. Paterson. 196 pp. 7 $\frac{1}{2}$ in. by 5 in. 189 figures. (London : Constable & Co., Ltd.) 2s. 6d. net; by post, 2s. 9d.

In view of recent developments, the subject of mine signalling has become one both of increased complexity and importance, and many will welcome a book dealing with such matters. The author goes into a considerable amount of detail, especially in his description of bells, keys, indicators, batteries, wiring, &c., and the arrangement of shaft and haulage signals, and our principal criticism is that he has allowed the fulness of the elementary part to interfere to a slight extent with the development of the later portion where we should have liked to see a little fuller treatment of such subjects as new systems of indicating signal gear of the nature now required by the Home Office regulations, and a little more on the much-discussed question of danger from

sparking from signal installations, where gas may be present. There is much, however, that is eminently practical and should be of use to those engaged in the fitting-up of signal installations in mines.

Magnetism and Electricity. By S. S. Richardson. 598 pp. 7 $\frac{1}{2}$ ins. by 5 ins. 260 figures. (London : Blackie & Son, Ltd.) New Edition. 4s. 6d.; abroad, 5s.

The author in this work, of which the second edition is now before us, addresses himself to students of physics rather than budding electrical engineers. He assumes some acquaintance with the "elementary descriptive parts of the subject and introduces the reader to more quantitative ideas. The work is divided into three parts: on magnetism, static electricity, and current electricity respectively, and some idea of the range of the book may be gathered from the fact that the principles of the dynamo and motor are contained in a short chapter near the end, followed by one on electrical units, and one on terrestrial magnetism and atmosphere electricity. The present edition is designed partly with a view to satisfying the requirements of certain Board of Education and University Examinations.

Alternating-current Electricity and its Applications to Industry. First Course. By W. H. Timbie and H. H. Higbie. 534 pp. 7 $\frac{1}{2}$ in. by 5 $\frac{1}{2}$ in. 389 figures. (New York : John Wiley & Sons; London : Chapman & Hall, Ltd.) 8s. 6d. net; abroad, 9s. 2d.

The authors provide in this work a first course of instruction in alternating currents of a thoroughly practical nature, following their subject through clearly and logically, and stimulating the interest of the student throughout by illustrations from problems of practical engineering. Thus a considerable amount of space is given to armature windings of alternators, but this is not, as the authors explain, with the object of teaching how to wind an armature, but to help in giving a clear understanding of the real meaning of phase difference, vector summation, and polyphase relations. A large number of problems to be solved by the student are given, which add to the utility of the book.

A Manual of the High-Speed Steam Engine. By H. K. Pratt. 270 pp. 8 $\frac{1}{2}$ in. by 5 $\frac{1}{2}$ in. 182 figures. (London : Constable & Co., Ltd.) 5s. net; abroad, 5s. 6d.

The development of the high-speed steam engine is indissolubly bound up with the history of electric lighting plant, and is a branch of steam engineering well meriting a treatise to itself. The author is, we believe, the first to supply this want, and in doing so he has produced a sound and practical manual dealing with the history, design, testing, and operation of these engines, including clear and useful drawings of complete typical engines, as well as details. The book deals primarily with the double-acting, forced-lubrication type of engine, but the single-acting engine is also considered. The high-speed engine has by no means been totally eclipsed by the turbine, even though the days of its largest sizes may be numbered, and engineers will continue to value the results of experience embodied in this work for some time to come.

Dynamo and Motor Building. By A. H. Avery. 152 pp. 7 in. by 5 in. 145 figures. (London : Cassell & Co., Ltd.) 1s. net; by post, 1s. 1 $\frac{1}{2}$ d.

This is a thoroughly practical book for the amateur, and is clearly written and well illustrated, containing a great deal of useful information for those desirous of constructing small dynamos, motors, converters, both as regards electrical details and mechanical methods. The machines described are not toys, but properly designed apparatus, which, if the instructions are followed, will also be properly constructed.

Dynamometers. By Rev. F. J. Jervis-Smith, edited and amplified by C. V. Boys. 267 pp. 9 in. by 5 $\frac{1}{2}$ in., 119 figures. (London : Constable & Co., Ltd.) 14s. net; abroad, 14s. 8d.

Prof. Boys, to whom the task fell to complete and prepare for publication this work of the late Rev. F. J. Jervis-Smith, has prefaced it with a charming little biographical note of the author, who is well known as having been the pioneer of engineering education at Oxford, and had devoted close attention for many years to problems in the measurement of power. The book deals with dynamometry with great thoroughness, giving us an interesting historical sketch of experimental progress, setting forth such theoretical considerations as are required with clearness, and describing the construction and working of practically every apparatus that has been devised for the measurement of mechanical power, including appliances for the laboratory, the test bed, the steamship, and the elaborate instruments that form part of marine testing tank equipments, and the whirling tables used for aeronautical research.

The Electrical Conductivity and Ionisation Constants of Organic Compounds. By H. Scudder. 580 pp. 9 $\frac{1}{2}$ in. by 6 $\frac{1}{4}$ in. (London: Constable & Co., Ltd.) 12s. 6d. net; abroad 13s. 4d.

This is a valuable work of reference to the organic chemist and physicist, and contains tables of organic substances, with their chemical formulae, specific conductivities, ionisation constants, conductivities of aqueous solutions and insolvents other than water, and other quantitative data. The list contains references to a bibliographical index of researches into the properties of each substance. There is also a formula index and a subject index, and the whole painstaking compilation forms a most complete compendium of recent organic chemical research.

Papers set in the Qualifying Examination for the Mechanical Sciences Tripos, 1906-1913. 90 pp. 7 $\frac{1}{2}$ in. by 5 in. 46 figures. (Cambridge: The University Press.) 2s. net.; by post, 2s. 2d.

THIS is a collection of questions set at Cambridge in what may be described as an intermediate examination in engineering. Mathematics and mechanics only are dealt with. The work will be useful to students as indicating the range of these papers.

American Handbook for Electrical Engineers. Edited by H. Pender. 2033 pp. 7 $\frac{1}{2}$ in. by 4 $\frac{1}{4}$ in. 891 figures. (New York: John Wiley & Sons; London: Chapman & Hall, Ltd.) 21s. net; abroad, 21s. 10d.

The bulky "pocket-book" of nearly 2,000 pages has been compiled by a staff of twenty-seven specialists, and although primarily addressed to the electrical engineer, a certain proportion of civil and mechanical engineering matter required by him is included; and again it should be of use to the civil engineer whose work occasionally takes him into electric fields. The practical information, which rightly forms the largest portion, is kept more or less separate from the theoretical discussions in each section. A somewhat different procedure is adopted from that in most of the existing works of this kind in that no subject-matter sequence has been attempted, but the articles are arranged alphabetically as in an encyclopaedia. It must be understood that American practice is principally referred to. For example, the only rules given in full are the new Standardisation Rules of the American Institute of Electrical Engineers. English readers will also find the use of the B. & S. wire gauge, the circular mil, and the ton of 2,000 lb. a little inconvenient, but on account of its completeness and up-to-dateness the work should be well appreciated here as well as in its own country. Telephony and wireless telegraphy are dealt with as well as the heavier branches of engineering, and a useful feature is a short bibliography at the end of each section.

The Universal Electrical Directory (J. A. Berly's), 1915. 1,554 pp. 9 $\frac{1}{2}$ in. by 6 $\frac{1}{4}$ in. (London: H. Alabaster, Gatehouse & Co.) 21s. British and Colonial Sections only, 12s.

THE 1915 edition of this directory, published by our contemporary, the *Electrical Review*, has been issued. As usual the contents are divided into four sections, viz., British, Colonial and General, Continental, and U.S.A., and the entries total some 35,390 names. The publishers have not been seriously affected by the war in the revision of the entries in the Continental section, as a good many corrections were received before the war started. The usual full information regarding electricity undertakings in the United Kingdom, British Colonies, and some other countries is given. We need hardly add that the new edition of this directory is thoroughly welcome.

Pitman's Shorthand Writers' Phrase Book and Guide: Civil Engineering. 88 pp. 6 $\frac{1}{2}$ in. by 4 $\frac{1}{4}$ in. (London: Sir Isaac Pitman & Sons, Ltd.) 1s. 6d. net; by post, 1s. 8d.

THIS is one of a series of books intended as a guide to shorthand typists for various professions. In addition to a list of words and phrases in common use in engineering offices, with their shorthand equivalents, there are specimens of specifications and correspondence, together with a general outline of the routine work in a municipal or consulting engineers' office. To a beginner just entering such an office there is a good deal of useful information contained in the volume.

The Batti-Wallahs.—An informal meeting was held on Wednesday of last week at the Victoria Mansions Restaurant, under the chairmanship of Mr. W. Wyld (Borough Electrical Engineer, Hampstead). An excellent entertainment was provided. The March number of the *Batti-Wallahs' Journal* records recent proceedings of the Society and includes a series of portraits of the officers and committee, with a brief note on the career of the new president, Mr. Haydn T. Harrison.

Blomfield House,
London, E.C.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A discussion on "Inter-communication Telephones" took place at a meeting of the Association of Supervising Electricians on March 30th, opened by a Paper by Mr. T. F. Lee, of the Western Electric Co. Considerable discussion centred round the question as to whether the cables should be connected directly to the terminals of the sets, or (as recommended by Mr. Lee) through junction-boxes. In either case the author recommended the use of a "forming board," consisting of a piece of board with nails protruding at the same distance apart as the connectors in the set or junction-box, round which the wires are bent and then bound with waxed string. This keeps the wiring always neat. Some speakers preferred to have the bells within the instrument cases to avoid their being put out of adjustment when the instruments were dusted, a trouble which is more frequently present with some types of "circular" bells.

Telephone communication between divers and the surface has long been an accomplished fact in this country, but none the less the demonstration at the Empire Theatre on Wednesday of last week by Capt. L. Sorcho of an American diver's telephone was of interest. A member of the Press was sent down in a diving dress fitted with transmitter and receivers within the helmet into a glass-fronted tank, and carried on conversations not only with those assembled to witness the demonstration, but with the office of his journal.

ELECTRIC TRACTION NOTES

The directors of the Bristol Tramways Co. have declined to continue the negotiations with the Corporation as to the sale of the Company's undertaking. The Corporation had appointed an Option Committee, one of whose duties was to ascertain the concessions the Company would make in the event of the Corporation not exercising its right of purchase and agreeing to an extension of the Company's life. The next step in the matter, therefore, is left solely with the Corporation. The Company's case is that a sale at the present time would result in considerable benefit to the shareholders, and the breaking off of negotiations is said to be due to the failure of the Corporation to reciprocate the Company's endeavours to avoid, in present circumstances, the large expenditure of public money which will be necessary if the purchase actually takes place.

A novel form of electric vehicle is in use in the Panama-Pacific Exhibition in the shape of a two-seated miniature car with basketwork body, capable of a speed of three miles per hour, to take the place of the wheeled chairs which have been a feature of many exhibitions. The "Electriquette," as it is called, is illustrated in the Canadian *Electrical News*, and has battery power sufficient for eight hours' running.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

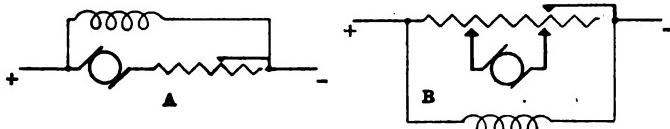

QUESTION No. 1437.

Acceptance tests of generators at works are often made by taking only copper and iron losses. Are these a reliable criterion of the operation of the machines at full load, particularly with regard to sparking?—"T. G."

(Answers must be received not later than first post Thursday, April 15th.)

ANSWERS TO No. 1435.

I wish to drive a milling cutter taking $\frac{1}{2}$ h.p. at 30 revs. per min. by means of temporary D.C. 15-h.p. motor which normally runs at 750 revs. Is it possible to reduce the speed of the motor to 30 revs., and will the speed remain fairly constant when the cutter is working, if a resistance is used in series with the

armature (with full excitation) to reduce the speed? I do not want to use reducing-gear. Are there any other ways of reducing the speed without altering the motor internally? Would it be better to shunt the armature across a resistance as in diagram "B" instead of series connection as in "A" to give constant speed?—"E. W."

The first award (10s.) is given to "ALPHA" for the following reply:—

It is possible to reduce the speed of the motor mentioned to 30 r.p.m. by means of series resistance, but the efficiency of working will, of course, be very low, and the speed of the motor will vary greatly with the load. The torque corresponding to 15 h.p. at 750 r.p.m. is 1,260 lb.-ins., and that corresponding to $\frac{1}{2}$ h.p. at 30 r.p.m. is 1,050 lb.-ins.; since the torque of the motor is proportional to armature current \times flux and the flux will be unchanged, it is evident that the motor will take $\frac{1050}{1260} = \frac{83}{100}$ per cent. of its normal full load current. The ventilation will be very much reduced owing to the armature having practically no fanning action at this low speed, and it is probable that the motor will overheat if the duty is of a practically continuous nature, unless it is designed as a totally enclosed machine. Assuming, however, that this difficulty does not arise, the speed characteristic and the efficiency will probably make the method of drive proposed impracticable, as shown below. A much better solution of the problem would be to arrange a temporary belt and countershaft, or gear drive.

(A) Plain series connection as shown in diagram A of the inquiry. Let V =supply voltage. Then, assuming that the C.R. drop in the motor at full load is 6 per cent., the back E.M.F. of the motor at 15 h.p. 750 r.p.m. will be $0.94V$ and at 30 r.p.m. it will be $\frac{30}{750} \times 0.94V = 0.0376V$. The C.R. drop at $\frac{1}{2}$ h.p. 30 r.p.m. will be $0.05V$, so that the total motor terminal voltage

will be $0.0876V$ and the series resistance must absorb the remainder of the supply voltage, or say $0.91V$. When the motor is running light, however, the current will be very much less. Assuming that it is 10 per cent. of the full load current, we find that the resistance will then only absorb 10 per cent. of $0.91V = 0.091V$, so that the voltage on the motor terminals will now be $0.909V$, and allowing for the motor C.R. drop the back E.M.F. must be approximately $0.9V$. Since the speed with constant flux is proportional to the back E.M.F. the speed of the motor running light with the resistance in series will be $750 \times \frac{0.9V}{0.94V} = 720$ r.p.m. In other words, the speed of the cutter before it commences its stroke will be twenty-four times the normal cutting speed (30 r.p.m.), and it is evident that either the cutter or the work would be seriously damaged by attempting to work under these conditions. With regard to efficiency, if C =full load current, it is evident that the power delivered to the motor terminals at full load is $0.0376VC$, and assuming the motor efficiency to be 85 per cent., the useful output of the motor will be $0.0745VC$, while the energy taken from the line = VC , i.e., the overall efficiency is only about $7\frac{1}{2}$ per cent.

(B) With the resistance connected partly in series and partly in shunt, as in diagram B, the speed characteristic will be improved, but the efficiency will be lowered still further. We have seen above that the voltage across the motor when giving $\frac{1}{2}$ h.p. at 30 r.p.m. will be $0.0876V$. This is also the voltage across the shunt resistance, so that if r is the shunt resistance in ohms, the current in this resistance will be $0.0876V/r$ and the current in the series resistance will be $C + 0.0876V/r$. We have also shown that the voltage across the series resistance must be $0.91V$, so that if R is the series resistance we have:—

$$R = \frac{0.91V}{C + 0.0876V/r}$$

From this, by assuming values of r we can find corresponding values of R . It can also be shown that the no load speed of the motor will be (approximately) $\frac{750r}{r+R}$ and the overall efficiency at full load will be $\frac{0.0745Cr}{Cr + 0.0876V}$. It will be found that if r be chosen so that the no load speed is four times the full load speed (120 r.p.m.), the overall efficiency at full load will only be approximately 37 per cent., while further reducing the no load speed will rapidly increase the losses in the resistances.

The second award (5s.) is made to F. G., who writes as follows:—

The speed of a shunt motor can be reduced only by increasing the field strength or decreasing the voltage. Nothing can be done with the field in this case, as it is already working at full strength, and the only ways of reducing the armature voltage by resistance methods are the two suggested in the question, which will be considered in turn, and to give point to the answer let us assume that the motor is $500V$ with a no load speed of 800 r.p.m. and an armature resistance of 0.6 ohms.

(A) *Field fully excited and the armature connected to line through a series resistance.* This resistance can be arranged to reduce the speed to 30 r.p.m. with $\frac{1}{2}$ h.p. output, and the speed will be constant with constant load; that is to say, with the same cutter working on the same material with the same depth of cut and rate of feed. When, however, a variation in these factors reduces the load the motor will race to an extent which can best be realised by calculating the no load speed:—

Current at 15 h.p. 750 r.p.m. = 25 amps.

Current at $\frac{1}{2}$ h.p. 30 r.p.m. = $\frac{1}{2} \times \frac{750}{15} = 25$ amps.

Armature drop at 21 amps. = $21 \times 0.6 = 12.6V$.

Back E.M.F. at 30 r.p.m. = $\frac{30}{800} \times 500 = 18.75V$.

∴ Armature voltage at 21 amps. 30 r.p.m. = $31.3V$.

Drop of voltage in series resistance must be $500 - 31.3 = 468.7V$.

∴ Series resistance = $\frac{468.7}{21} = 22.3$ ohms.

Assume motor would take 5 amps. at light load.

Voltage drop in series resistance with 5 amps. = $5 \times 22.3 = 111V$.

Voltage drop in armature with 5 amps. = $0.6 \times 5 = 3V$.

∴ Back E.M.F. = $500 - 114 = 386V$.

Motor speed light = $\frac{386}{500} \times 800 = 618$ r.p.m.

As this speed is evidently quite impossible, a simple series armature resistance will not serve.

(B) *Field fully excited with shunting resistance across armature and a series resistance between the armature and line.*

In other words, this means a potentiometer resistance across the line with the armature spanning a suitable section of it. If this resistance is designed to pass a sufficient number of times full load current, it is evident that the connection of the motor will have practically no effect on the current, so that the voltage between the tapping points may be regarded as the same on all loads. Let us assume this to be the case and that the voltage on the armature is as at full load in the previous case, that is $31.3V$. Now what is the light load speed?

The armature resistance drop will now be $5 \times 0.6 = 3V$.
 Back E.M.F. = $31.3 - 3 = 28.3V$.
 \therefore Light load speed = $\frac{28.3}{500} \times 800 = 45$ r.p.m.

While this 50 per cent. increase between full and no load can scarcely be called "fairly constant speed," it may perhaps serve the purpose.

It should be added that to obtain approximately this best possible result the potentiometer resistance should pass at least say six times full load current. That is to say it should have a maximum value of 4 ohms and a capacity of at least 130 amps.

for the assumed voltage. Such a resistance would cost more than a reducing gear, and with power at one penny per unit it would cost about 5s. per hour to operate, the only asset on the credit side being that no starter would be required.

Among other replies we may mention the suggestion of "M. M." that an automatic speed regulator consisting of a liquid rheostat controlled by a governor be contrived, and that of "Koil," who proposes running the armature circuit from a few large storage cells.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 1st, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

• 28,277/13. **Selective Signal Reception.** W. H. SHEPARD and A. E. McKECHNIE. A line or wireless telegraph system with a selective device actuated only by a predetermined signal. In this device, a number of suitably spaced contacts are provided, and a number of brushes move relatively to the contacts, and are automatically displaced by the reception of the message to the one side or the other, according as dots or dashes are received. (Five figures.)

5,662/14. **Arc Lamp Suspension.** G. A. HUGHES. A system of arc lamp suspension in which the lamp is suspended from an inner pivoted frame swinging out to clear the lamp for lowering, and a single locking device locks the lamp when raised against vertical displacement, makes the connection between the lamp and the leads and locks the tilting frame. (Two figures.)

6,070/14. **Oil Circuit Breakers.** F. B. HOLT. Oil switches with a special form of moving contact giving a particularly quick break, which prevents the formation of bubbles of oil vapour. A row of inclined brushes is used of a form which reduces the displacement of oil to a minimum. (Two figures.)

10,368/14. **Apparatus for Enabling the Blind to Read.** E. E. FOURNIER D'ALBE. A row of moving dots of light are projected on to the letter to be distinguished by the movement of a perforated disc, and an image of the discontinuously illuminated letter is projected by a lens on to a light sensitive surface of selenium or other material in series with a telephone receiver. Different letters result in different sounds in the telephone, which the inventor states can be distinguished after sufficient practice. (Two figures.)

16,318/14. **Oil Circuit Breakers.** J. N. MAHONEY. Main and auxiliary moving contacts are provided, and reactance coils surround the fixed contacts. The main and auxiliary contacts are actuated by separate mechanisms, so that the auxiliary contacts close before the main contacts and open after them, so that the reactance is put in circuit before the final opening or closing. (Six figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: READ [Generating and control systems] 6,918/14; HOLDWAY and ANDERSON [Connectors] 13,960/14; TEGGIN and LONDON ELECTRIC WIRE CO. & SMITH'S, LTD. [Insulation] 19,878/14.

Heating and Cooking: W. T. HENLEY'S TELEGRAPH WORKS CO. and SAVAGE [Electrically-heated vulcanising apparatus] 13,348/14.

Instruments and Meters: BERRY [Indicating interruption or variation of current] 6,421/14.

Switchgear, Fuses and Fittings: CHERROU and LEMP [Switches] 8,010/14; SMITH [Circuit breaker] 18,747/14.

Telephony and Telegraphy: AUTOMATIC TELEPHONE MANUFACTURING CO. (Automatic Electric Co.) [Telephone systems] 6,428/14; MARTIN [Telephone systems] 6,659/14; GREEN [Telephone switches] 7,513/14; HAZARD [Telephone index or directory holder] 11,229/14; WESTERN ELECTRIC CO. (Woodward for W. E. Co., U.S.A.) [Telephone exchange systems] 13,523/14.

Traction: COLLINS [Signalling] 6,179/14; BOUND and ROWLAND [Train stops] 6,807/14.

Miscellaneous: CRAIG [Electric clocks] 6,970/14; MELLERSH-JACKSON (Posen) [Pocket lamps] 18,809/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

DYNAMOS, MOTORS, &c.: SCHÖNGUT [Armature winding] 3,932/15.

Instruments: LANDIS & GYR A.G. [Current measurement] 3,856/15.

Switchgear, &c.: ANDERSON [Switches] 3,657/15; VAN SWAAY and ANR. [Synchronisers] 3,676/15.

Telephony and Telegraphy: DE FOREST and ANR. [Wireless receiving system] 3,950/15; SÄRNMARK [Wireless telegraphy and telephony] 4,017/15.

Miscellaneous: FORD [Gyrostatic compasses] 10,095 and 24,847/14; LILIENFELD [Production of Roentgen rays] 4,097/15.

Amendments made

16,409/04. **Meters.** B.T.-H. CO. Amendments have been allowed in this specification, which is for induction motor meters, by which one of the claims is omitted and other omissions are made on account of the doubtful novelty of a portion of the subject-matter.

17,487/14. **"Wired" Wireless Telegraphy.** G. O. SQUIER. At the request of Dr. ERSKINE MURRAY, patentee of No. 15,718/11, an acknowledgment has been introduced into this specification of the lack of novelty of the use of a 0.01 microfarad condenser in the high frequency bridge, which enables ordinary telephone lines to be used for "wireless" reception.

Opposition to Grant of Patents

1,341/14. **Combined Starting Motor and Lighting Dynamo.** A. H. MIDGLEY and C. A. VANDERVELL. Opposition has been entered to this specification, which describes a machine with separate commutators and armature windings for use in its two functions and the field windings, which as a self-regulating dynamo leave half the poles unexcited, are re-grouped to give the full number of poles when working as a motor.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: C. E. G. GILBERT [Arc lamp] 27,303/08.

DYNAMOS, MOTORS and TRANSFORMERS: B.T.-H. CO. (G.E. CO., U.S.A.) [Single phase motors] 27,894/03; A.E.G. [Prevention of sparking of A.C. motors] 26,094/05; B.T.-H. (G.E. CO., U.S.A.) [Single phase motors] 27,849/07; H. A. MAVOR and MAVOR & COULSON [Induction motor with rotatable "stator"] 28,040/07.

Electrochemistry and Electrometallurgy: C. BINGHAM [Electric furnaces] 28,593/06; T. A. SMITH and T. DEAKIN [Electro-plating] 27,624/08.

Heating and Cooking: S. L. R. PRICE [Electric heating] 29,411/09.

Ignition: SOC. ANON. MONBARBON [Magneton] 24,737/08.

Storage Batteries: G. LUCKOW [Regenerating battery plates] 29,706/09.

Switchgear, Fuses and Fittings: G. SWEETSER [Thermal flasher] 27,213/08.

Telephony and Telegraphy: GES. FÜR DRAHTLOSE TELEGRAPHIE [Wireless telephony] 26,530/07.

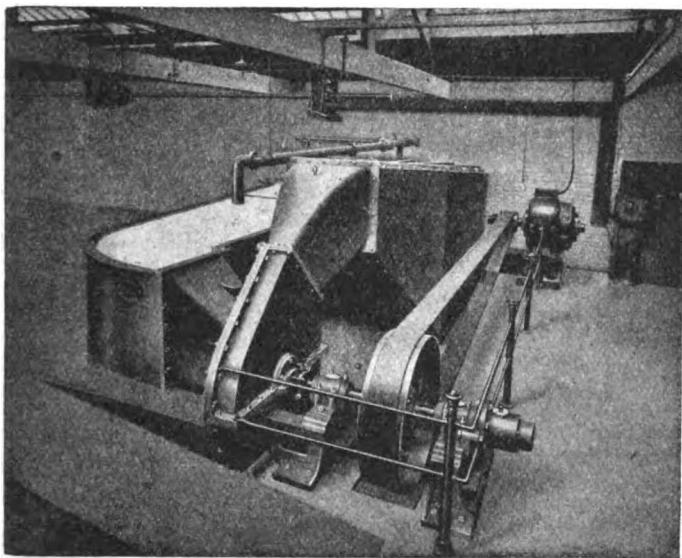

Traction: T. A. HEARSON (Bleichert) [Electric ropeways] 27,733 and 27,734/03.

Miscellaneous: OTIS ELEVATOR CO. (Otis Elevator Co., U.S.A.) [A.C. lift control] 27,352/04; W. FAIRWEATHER (C. H. Huff, U.S.A.) [Electrostatic separators] 27,449/04; SIEMENS BROTHERS DYN. WKS., LTD. and C. S. GRIMSTON [Duplex searchlights] 28,004/07; H. SKELTON [Ozoniser] 27,107/08; ELECTRIC EXPORT GES. and E. GOTTSCHALK [Miners' lamps] 29,789/09.

"ELECTRICAL ENGINEERING" TRADE SECTION

ELECTRIC DRIVE FOR PAPER MAKING MACHINERY

AN example of the electric drive as applied to paper-making machinery is given in the accompanying illustration, which shows a 45-h.p. "Witton" motor supplied with power at 230 volts, running at 420 r.p.m., and driving a special kind of breaking and bleaching engine. The function of this machine is to break or disintegrate the sheets of wood

ELECTRICALLY-DRIVEN PULP BREAKING PLANT.

pulp by means of a special impeller and circulate the pulp to the bleaching engine in a concentrated form. The motor is controlled by a "Witton" controller and a main switch with ammeter, seen on the extreme right of the illustration. The electrical equipment was supplied by the General Electric Co., Ltd., of Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.

ARTIFICIAL DAYLIGHT

IN response to a number of inquiries for glassware which will ensure artificial light of daylight value, the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), are putting on the market a most complete range of colour-matching screens and globes. The name "Trutint" has been given to the glassware employed, and it is available in several grades.

In one variety the composition of the glass is such as to ensure the most accurate matching in colour comparison work, but is not intended for general room lighting. Another coloured glass is for general illumination, and gives a light of "noon" sunlight value, and is particularly suitable for general lighting in paint shops, lithographic plants, art galleries, &c. The "noon" sunlight globe is made of clear Trutint glass sandblasted inside, and ensures a light corresponding to noon sunlight. The watts per candle efficiency of Mazda half-watt lamps when fitted with this particular type of globe is practically equivalent to standard Mazda lamps in a white opal globe. A variety is also supplied for general illumination, and ensures a light of "afternoon" sunlight value. The purpose of the Trutint globes in this case is to furnish a light that is slightly more efficient in watts per candle than in the last mentioned, and necessarily somewhat yellower, as is the case with afternoon sunlight, forming a compromise between colour and efficiency. The globes in this group are made of Trutint glass cased over by a light opal, or a very light opal body in which Trutint has been mixed, and are known respectively as "Trutint Cased" and "Trutint Opal." The cased glass appears white when unlighted, while the other units appear bluish. When possible, complete installations of Trutint glass should be ob-

tained, so that the yellow light of other lamps be not present. Trutint glassware is not made for use with ordinary Mazda lamps, but has been specially compounded for Mazda half-watt lamps, which, owing to their high intrinsic brilliancy, are more like sunlight in colour than previous incandescent lamps.

ELECTRICALLY WORKED GATES

ASOMEWHAT novel application of electric driving is for the remote control of the opening and closing of gates. The General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), have called our attention to an installation of this kind in the North of England, where a pair of handsome iron gates at the entrance to a drive are worked by a $\frac{1}{2}$ -h.p. "Witton" motor geared through a clutch to a mechanism for opening and closing the gates. The motor and mechanism are housed in a small tunnel underneath the gates, a small manhole situated to one side giving access. Power is supplied from the house installation, and the controlling switch is placed in the garage. This controlling switch is of the reversing type, so that putting the switch in one position closes the gates, and putting it in another position opens them. In completing the circuit the motor is started up and a solenoid circuit energised, thereby connecting the motor to the gate-opening mechanism through the clutch. The presence of this clutch, which is open when the motor is not at work, enables the gates to be opened or closed by hand when desired. The gates were constructed by Messrs. Lockerbie & Wilkinson, Tipton, Staffs, and the operating mechanism by the Witton-Kramer Electric Tool & Hoist Co. (Witton, Birmingham), for whom the General Electric Co., Ltd., are sole selling agents.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Australia.—The Melbourne Electric Supply Committee requires 13 tons of bare hard-drawn copper cable and 13,560 yards of insulated copper cable. Tenders to Messrs. McIlwraith, McEacharn & Co., Biliter Square Buildings, E.C.

Barking.—The Council has decided to apply for a loan of £18,000 for electrical extensions.

Dundee.—Centrifugal circulating pumps and cast-iron piping. General Manager and Engineer. April 28th. (See an advertisement on another page.)

Glasgow.—Twelve months' supply of cables, meters, and arc lamp carbons. Chief Electrical Engineer. April 16th. (See an advertisement on another page.)

Heywood.—We referred at some length on page 102 of our issue for March 11th to the application of the Council for sanction to a loan of £12,480 for electrical extensions. This was the first application to come under review after the Treasury's announcement that all borrowings by municipal electricity undertakings must be curtailed to such an extent as is absolutely necessary to deal with power supplies for Government contracts. The amount asked for was £12,480, but the L.G.B. has now given its sanction to £6,400.

Sheffield.—A L.G.B. inquiry was held last week concerning a loan of £164,373 for electrical extensions. It was explained that this large sum is necessary, not for ordinary expansion of business, but in order to supply the large armament firms in the city. The amount is apportioned as follows:—New generating plant, £86,813; sub-stations and equipment, £50,000; buildings at Neepsend, £27,560. Among the applications now in hand is one for six new melting furnaces of 6,000-kw. capacity. It was also pointed out to the Inspector that one firm could not carry on at the speed required by the Government without an extra supply of power, and, further, the Government had given the Electricity Committee permission to prevent their men from recruiting, having regard to the desirability of turning out the largest possible number of units.

New Zealand.—The Public Service Stores Tender Board at Wellington requires 74½ miles of lead-covered cable. Further

particulars at 73 Basinghall Street, E.C. Tenders by April 21st. This information is only of value to firms who can advise agents by cable.

West Ham.—The Council has decided to withdraw £16,863 from the Loans Fund in order to purchase machinery. This sum will bear interest at the rate of 3½ per cent.

Wiring

London: Woolwich.—220 houses to be wired for the Woolwich Borough Council at Eltham.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Bolton.—Factory for R. Walker, Ltd.

Darwen.—Extension to Moss Bridge Hospital.

Miscellaneous

Australia.—The Victorian Railway Commissioners require 120 single-phase track transformers; 300 electric train stops; bogie trucks, wheels, and axles for 10 cars. Further particulars at 73 Basinghall Street, E.C.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Burton-on-Trent.—The Electricity Department has placed a contract with E. Bennis & Co. for two stokers and self-cleaning compressed air furnaces.

Croydon.—The tender of Callender's Cable & Construction Co. for a twelve months' supply of cable on a sliding scale according to the market price of copper has been accepted.

Huddersfield.—An order has been placed with E. Bennis & Co. for 4 pairs of chain-grate stokers for Stirling boilers.

Iford.—A contract has been placed with the B.T.-H. Co. for a twelve months' supply of meters.

Salford.—The Tramways Department has placed the annual contract for Wotan, Tantulum, and carbon filament lamps with Siemens Bros. Dynamo Works.

Walthamstow.—The contract with J. H. Tucker & Co. for single and double pole 5 and 10 ampere tumbler switches has been renewed for a further twelve months.

LOCAL NOTES

Colne: *The Rateable Value System of Charging.*—Mr. A. G. Cooper, the Borough Electrical Engineer, has recommended an optional system of charging for electricity on a rateable basis with a secondary charge of 4d. per unit. The matter has been referred to a Sub-Committee.

Croydon: *Increased Charges.*—The flat rate for lighting is to be increased from 3½d. to 4d. per unit. A recommendation that the charge for public lighting should be increased in corresponding proportion to the increase made by the Gas Co. for gas lamps has been referred back.

Dublin: *Electricity Charges.*—The Corporation has decided to postpone giving a decision as to increasing the charges for lighting and power until the detailed estimates for 1915-16 are ready.

London: *Woolwich: Electricity Loans.*—Terms have been arranged with the L.C.C. for the borrowing of £48,000, which is the balance of expenditure to be incurred on the extensions to the electricity undertaking in accordance with the recommendation of Sir John Snell. This matter has been under discussion for some considerable time in connection with the loan periods. The L.C.C. first suggested that some of the older plant should be sold and the outstanding loans paid off immediately, but this view did not meet with the approval of the Borough Council. The total amount of out-

standing loans on a 42 and 39 years' basis for plant and machinery is £64,732, and the condition proposed to be attached to the new loan is that the amount outstanding on April 1st, 1920, of the £64,732 is to be repaid within one-half of the periods then unexpired. Subject to this condition, which the Borough Council has accepted, the sum of £35,000 has now been sanctioned, leaving the remaining £13,000 to be dealt with after a further report by Sir John Snell.

L.C.C.: Electric Lighting Charges.—The decision of the London electric supply companies to increase their charges, as notified on page 142 of our last issue, was raised at the meeting of the L.C.C. before the Easter recess. Mr. W. C. Johnson hinted that the companies were increasing their charges solely to maintain dividends. Mr. G. H. Hume, Chairman of the London Electricity Supply Committee, pointed out that the companies were still charging less than the maximum price mentioned in their Provisional Orders, and were apparently within their legal rights. He promised, however, to give consideration to a suggestion as to whether the present legislative conditions under which the companies work affords sufficient protection to the public.

Maidstone: *Increased Charges.*—The price of current is to be increased temporarily by ½d. per unit for lighting and 1½d. per unit for power, owing to the higher cost of coal.

Manchester: *The Barton Power Scheme.*—Reference has already been made to the representations made by the Corporation to the Treasury to grant an exception to the prohibition of capital expenditure upon new electricity works in the case of the Barton power scheme, having regard to its magnitude and the pressing needs of the city. The Central Executive Committee of the Employers' Parliamentary Association has passed a resolution urging the Government to sanction the scheme on the ground that to hold it back will hamper to a very considerable extent the firms engaged on Government contracts. According to the statements made by the L.G.B. Inspectors, however, there is no likelihood of consent being refused for the necessary machinery to keep such firms supplied with all the power they need. The point made by the Corporation itself is that the whole of the scheme should be allowed to go forward.

Stoke-on-Trent: *Large Power Supply.*—The Council has sanctioned the agreement with Messrs. Keeling & Walker for a large power supply in connection with a new chemical process previously worked in Prussia, referred to on page 100 of our issue for March 4th. The contract contains a coal clause.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £76 10s. to £77 (last week, £76 to £76 10s.).

Prices of Fittings.—The British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), inform us that a 10 per cent. advance has been made in their prices of electrical fittings.

Agency.—A firm in Wellington (N.Z.) desires to represent British manufacturers of lead-covered cable. Further particulars at 73 Basinghall Street, E.C.

Change of Address.—Mr. J. G. Lorrain, Consulting Engineer and Chartered Patent Agent, has removed to 9 John Street, Adelphi, W.C.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Companies Struck off Register.—The following have been struck off the register of joint stock companies:—Electrical Regulators & Economisers, Ltd.; Indestructible Accumulators, Ltd.; International Electric Transport & Enterprise Company of Alsace-Lorraine, Ltd.; Kellogg Manufacturing Co. (Europe), Ltd.; Leeds & Bradford District Electric Railways, Ltd.

Midland Electric Corporation for Power Distribution.—The full dividend is paid on the 6 per cent. preference shares for 1914, carrying forward £3,650, after writing off £9,083 for depreciation. This is an improvement on 1913, when only the debenture interest was met.

SUMMARY

EXTENSIONS of plant, including two large turbo-alternators, boilers, switchgear, and rotary converters, have recently been put down at the Swansea Electricity Works (p. 160).

IN a Paper published by the Institution of Electrical Engineers, Mr. S. Evershed described an investigation into the resistance to motion of various types of meter counting trains (p. 160).

WE publish some particulars of the Constantinople telephone system. The English staff has been displaced by a Hungarian staff; they have been obliged to leave Constantinople, and when last heard from were across the Bulgarian frontier (p. 161).

A NOTE with regard to the terms used in connection with cables in the United States points out that those now accepted there differ to some extent from those employed in Great Britain (p. 161).

THE equipment of an electrically driven textile mill is described in an illustrated article (p. 162).

A PAPER by Mr. S. M. Hills, read at a meeting of the Junior Institution of Engineers on Monday, reviewed the subject of electric heating and cooking, and gave practical notes on modern apparatus for these purposes. (p. 163).

SEVERAL technical books are reviewed in this issue (p. 163).

MR. C. HAMILTON WICKES, H.M. Trade Commissioner in Canada, gave an address on Friday on the marketing of British goods abroad. He said that our present

trading methods with foreign countries are very little better than they were in the eighteenth and the early part of the nineteenth centuries (p. 164).

METHODS of determining whether a three-phase winding is star or mesh connected are discussed in our Questions and Answers Columns (p. 165).

SOME interesting details of the conditions under which field telegraph and telephone work are carried out at the front are given under "Telephony and Telegraphy" (p. 165).

AMONG the subjects of specifications published at the Patent Office last Thursday were tramcar brakes, telephony and insulating material. The grant of a patent for helical filament lamps of an application of C. O. Bastian has been refused. A patent for improvements in electro-pneumatic multiple unit train control expires this week, after a full life of 14 years (p. 166).

EXPENDITURE upon new plant is contemplated as follows:—Dover, generating set, £6,000; Leigh, £2,813; Middleton, mains, £3,000; Wigan, boilers, £6,000.—Cable, switchgear, transformers, and public lighting are required at Abercynon; rotary converters at Bexley; generating plant at Ballymena; arc lamp carbons at Melbourne; and electric cranes in Spain (p. 167).

A DIFFICULT position has arisen between the Belfast Electricity Committee and its Chief Electrical Engineer.—The question of reduction in street lighting charges through the war has arisen at Chichester.—The Board of Trade is stipulating that new electric lighting provisional orders must not be put into force before the end of the war (p. 168).

AN issue of £100,000 new capital is being made by the London Electric Supply Corporation (p. 168).

Arrangements for the Week.—(To-day) Thursday, April 15th.—Institution of Electrical Engineers, Victoria Embankment, E.C. "The Power Supply of the Central Mining-Rand Mines Group," by J. H. Rider. 8 p.m.

Friday, April 16th.—Institution of Mechanical Engineers, Storey's Gate, S.W. Presidential address by W. C. Unwin, F.R.S. 8 p.m.

Saturday, April 17th.—Association of Mining Electrical Engineers, University College, Nottingham. "Protective Devices against Lightning and Surges," by E. K. Scott and L. F. Fogarty. 4 p.m.

Birmingham and District Electric Club, Swan Hotel, New Street. "Telephones," by E. J. Jarrett. 7 p.m.

Monday, April 19th.—Institution of Post Office Electrical Engineers, I.E.E., Victoria Embankment, E.C. Annual General Meeting. 5 p.m.

Electrical Trades Benevolent Institution, I.E.E., Victoria Embankment, E.C. Annual General Meeting. 6.30 p.m.

Tuesday, April 20th.—Wireless Society of London, I.E.E., Victoria Embankment, E.C. "Methods of Measurement of the Strength of Wireless Signals," by Prof. E. W. Marchant. 8 p.m.

Wednesday, April 21st.—Association of Mining Electrical Engineers, West of Scotland Branch, Royal Technical College, Glasgow. "Bearings of Electrical Machinery," by A. Gibson. Also discussion on paper, "Some Experiences in the Handling of Electricity," by A. Smellie. 6.30 p.m.

EXTENSIONS OF PLANT AT SWANSEA

IMPORTANT extensions have been made in the plant at the generating station of the Swansea Electricity Department. The new plant includes two large turbo-alternators, with condensing plant, switchgear, &c., two rotary converters, and the necessary extensions in boiler plant.

The turbo-generators are of the horizontal Curtis type, made by the British Thomson-Houston Co., Ltd. (Rugby), and are designed to give 1,875 k.v.a. each when running at 3,000 r.p.m., and supplied with steam at a pressure of 150 lb. per sq. in., and a vacuum of 28 in. The generators give three-phase current at a pressure of 6,600 volts and 50 cycles. Each generating set is capable of giving 25 per cent. overload for two hours continuously and 50 per cent. overload for ten minutes, with steam at normal pressure and 85 per cent. vacuum. The turbines are provided with centrifugal governors capable of controlling the speed within 2 per cent. from no load to full load, and an emergency governor, positive in action, designed to shut off the steam should the turbine reach a speed of 15 per cent. above the normal. The governors are fitted with electric motors, connections from which are taken to the switchboard gallery so that the speed of the machines may be adjusted therefrom. Dry-air filters are provided; these are fixed outside the building and connected by means of air-ducts to the alternators. The condensing plant was made by Cole, Marchent & Morley (Bradford), and is of the surface type, with Edwards' pattern air-pumps. The air and circulating pumps are driven by a single motor. The condenser is designed to maintain a vacuum of 28 in. when condensing 27,000 lb. of steam per hour, with cooling water at a temperature of 65° F. and a 30-in. barometer.

The extra-high-tension switchgear was supplied by the British Westinghouse Electric & Manufacturing Co., Ltd. (Trafford Park, Manchester), and is arranged for remote electrical control. The low-tension control switches and instruments are mounted on a bench-board of black enamelled slate. The E.H.T. switchgear is placed in cubicles built of moulded stone, and sheet-iron doors are provided for the oil-switch cubicle; the doors of the other E.H.T. chambers are of expanded metal. Red and green lamps, fixed on the control panels, show whether any particular oil switch is open or closed. The E.H.T. switchgear controls the two turbo-generators, two 500-kw. rotary converters, and four three-core 0·1 sq. in. outgoing feeders. Two D.C. rotary converter panels for 440-580 volts have also been supplied, arranged for lighting or traction.

There are two Westinghouse rotary converter sets at the generating station. Each converter has a capacity of 500 kw. at 750 r.p.m., and is of the six-phase eight-pole horizontally divided type, suitable for giving any D.C. voltage between 440 and 480 when operating as shunt machines or 500 volts at no load, and 560 volts at full load as compound machines. An A.C. booster is mounted on the rotary converter shaft, and a squirrel-cage induction motor for starting purposes is mounted at the other end of the shaft. One 550-k.v.a. 3/6-phase oil-insulated self-cooling transformer is provided, suitable for transforming from a 6,600-volt 50-period supply to a suitable secondary voltage. The boosters allow of complete and independent control of the power factor on the A.C. side and the voltage on the D.C. side. This, of course, is possible because the power factor control and the D.C. voltage control are obtained by adjusting the rotary and booster excitations respectively. By this means, therefore, the power factor on the A.C. side may be maintained at unity, or even leading, at any load or voltage on the D.C. side. Any lagging current taken by induction motors on the A.C. system can therefore be neutralised by the leading current of the rotary converter. The starting gear for these sets is quite simple. It consists of a starting panel upon which is mounted a three-pole low-tension switch in the main L.T., A.C. current, a smaller three-pole switch for the starting motor stator circuit, a double-pole rotary field switch, and a central zero D.C. voltmeter. For starting up, all these switches except the field switch are opened. The oil switch on the E.H.T. side of the rotary transformer is then closed. On now closing the starting motor stator switch, the L.T., A.C. circuit would be completed through the starting motor stator, and the motor would therefore start. The stator of the induction motor is wound for the same voltage as that on the secondary side of the transformer. Each of the three phases of the rotary converter are connected in series with the slip-rings; the primary circuit, therefore, is completed through the armature. At the first moment of starting the motor has practically full voltage across its windings, due

to the low impedance of the rotary armature. Owing to the high impedance of the starting motor windings, the current is reduced to about 30 per cent. of the normal full load current. When the D.C. voltage builds up, the voltmeter is watched and the field current is adjusted to give normal voltage. The starting motor is then short-circuited by closing the low-tension alternating switch, and then the motor starting switch opened.

The new plant in the boiler-house consists of two Stirling water-tube boilers fitted with superheaters and under-feed mechanical stokers. One boiler has a heating surface of 5,157 sq. ft. and a grate area of 91 sq. ft., and is capable of evaporating 26,000 lb. of water per hour from and at 212° F. The other boiler is slightly larger, having a heating surface of 5,719 sq. ft. and a grate area of 98 sq. ft., and is capable of evaporating 29,000 lb. of water per hour from and at 212° F. The superheaters were made by the Superheater Units, Ltd. (Swansea), and consist of four distinct units complete with cylindrical solid draw steel heaters, disposed one on each side of the central steel inlet and outlet junction piece containing solid diaphragm faced on each end, and provided with flanges for the attachment of the units, which are fitted with wrought steel flanges. The four units contain 88 tubes, giving a total heating surface of 580 sq. ft. The mechanical stokers were made by the Underfeed Stoker Co., Ltd., and are of the push plate type.

The Uplands is the only sub-station ready for running at present. The plant in this sub-station consists of two 500-kw. rotary converters, together with the necessary transformers and switchgear.

We are indebted for the above particulars to the kindness of Mr. J. W. Burr, Borough Electrical Engineer.

METER COUNTING TRAINS

A PAPER by Mr. S. Evershed, containing the results of a painstaking research into the effect of the variable resistance of motion offered by the registering trains of electric supply meters, is published in the *Journal of the Institution of Electrical Engineers*. The author arrives at the following conclusions:—

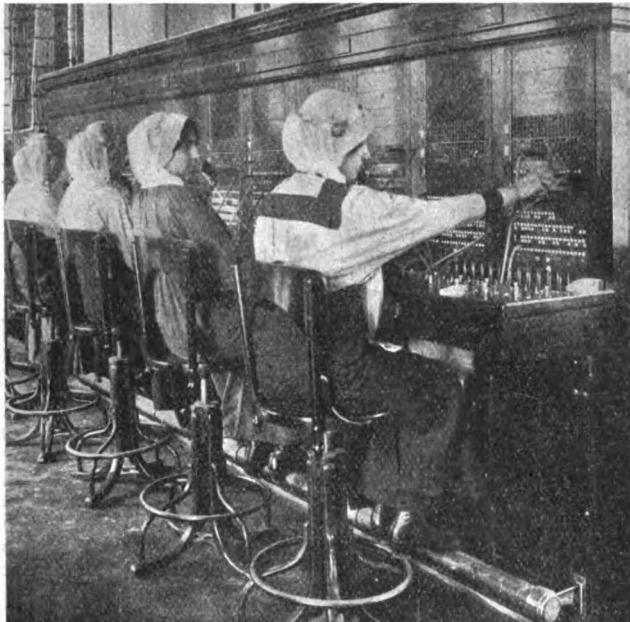

The only variations to be reckoned with in meters with pointer dials are the small irregular changes common to all meter trains, which at one-tenth load with a worm drive may amount to as much as 1·2 per cent. either way in the case of a meter which has a full-load torque as low as 1·grm. cm., and perhaps as much as 0·4 per cent. with a spur drive. They are quite haphazard in their occurrence, and in those instances in which low-load testing is affected by them nothing but a prolonged run will secure a fair average. When a meter has a creep counter dial of the Harding type the fall in speed at times when one or more nines are changing to zero is apt to lead to considerable discrepancies at a low load in the case of all meters which have a torque-speed product of less than 100 (grm. cm. × r.p.m.). The only way to avoid them is to carry out all low-load tests at times when the first digit wheel alone is in motion. Although the decrease in speed which results from the increase in resistance during the nine-changing periods may be very large, the resulting under-registration over a long period of use is unlikely to amount to as much as 1 per cent., and might well be allowed for in the initial adjustment of meters. With "jump" counter dials, provided the jump device is not fitted on an axle nearer to the rotor than the tenths axle in a 1-kilowatt meter, the units axle in a 10-kilowatt meter, or the tens axle in a 100-kilowatt meter, the periodic changes due to the rising and falling of the jumper weight and counter weight are comparatively small, but would certainly have to be reckoned with in low-load tests on meters which have a torque-speed of less than 50. With a jump counter which has both jumper and counter weights, the speed rises above and falls below the normal value twice in each revolution of the axle on which the jump device is fitted. If low-load tests are carried out at times when either of the digits 1, 4, 6, and 9 is passing by the centre of the dial opening, the meter should be running at the normal speed corresponding with the load. By carrying out a low-load test in this way, comparatively large periodic variations should not give rise to any difficulty.

The Kenotron.—The article on this device in our last issue was based on an article in the *General Electric Review* (published by the General Electric Co. of New York). By an error the name of our contemporary was given as the *General Electric Journal*.

THE CONSTANTINOPLE TELEPHONE SYSTEM

THE telephone system in Constantinople, which belongs to an English company, the Constantinople Telephone Co., Ltd., had been in successful operation for some little time before the declaration of war with Turkey on November 5th. Constructional work in connection with extensions was proceeding, and the European war had affected the Company very little except as regards the difficulties of getting material delivered. The situation is now very different, however, as will be seen later in this article.

In Constantinople three large telephone exchanges have been built, and a few sub-exchanges, and there are about 5,000 subscribers. The plant is of a most modern character, having been so recently erected; the common battery system is employed, and a feature is that there are practically no overhead wires, the majority of the wires being either underground or in cable on the face of buildings. In connection with junction wires also the most modern practice has been employed, "loaded" wires being used throughout, and no wire heavier than No. 20 S.W.G. The system extends to both sides of the Bosphorus, and reaches Prince's Island on the south and Kavak on the north. Altogether the Company employed about fifty Europeans on the staff, and, in addition, there were about twenty-five workmen on erection work

TURKISH OPERATORS IN CONSTANTINOPLE TELEPHONE EXCHANGE.

belonging to the British Insulated & Helsby Cables, Ltd., and about twelve belonging to the Western Electric Co., Ltd. The men of the two latter Companies, however, left after the declaration of war, as it was impossible to proceed with much of the new work on account of the non-delivery of material. A few of the Company's linesmen also returned when war was declared with Turkey, but the majority of the European staff remained. The work of the exchange went on just as before, and, in fact, new lines were connected up to some extent, so far as material there permitted. Naturally there were a few minor troubles, and the situation was a difficult one for the staff, but, taken as a whole, everything proceeded quite calmly until about three or four weeks ago. It may be mentioned that the Company has been accustomed to working under war conditions, for this is the fourth war in the Balkans since they started the erection of the exchanges.

Soon after the bombardment of the Dardanelles started, however, trouble began, probably owing to German influence, and, as stated in the daily papers last week, the authorities have seized the property of the Telephone Company, and, according to the *Daily Telegraph*, have inflicted great hardships on the British staff. They left Constantinople about three weeks ago and got as far as Kuleli Burgas, but after being detained there three days were sent back to Stamboul. They were allowed to leave Constantinople again a few days later, and finally arrived at Dedeagatch, the other side of the Bulgarian frontier, on Good Friday. Although no news has yet been heard directly from them, it is known that Mr. Douglas Watson, the General Manager, and twenty-four other men, arrived together at Dedeagatch, together with three ladies (probably including Miss Minter, the Traffic Manager).

Mr. Watson's staff included Mr. J. M. Anderson, the Accountant, and Mr. Andrew Duncan, the Chief Electrician. Mr. Podmore, the Chief Engineer, had come home before war was declared with Turkey, and obtained a commission over here in the R.E. According to the *Morning Post* last week, the Constantinople staff has been replaced by Hungarians, under the control of the Austrian Councillor, Eugen Redl.

The operators themselves included only a few English-women, who were engaged there in the ordinary course, and were not brought over specially. The majority are Jewesses, Armenians, and Greeks, and there are a few Turks, in spite of their being Mohammedans.

Our illustration shows a group of these Turkish operators in their distinctive head-dress, and was the subject of a slide which was shown by Mr. W. W. Cook at the discussion on Mr. W. Ll. Preece's paper a fortnight ago.

CABLE TERMINOLOGY

CARE must be taken to avoid confusion when corresponding with America with regard to cable and wires, as the terms employed there are to some extent different from those prevalent here. The American Bureau of Standards, working in conjunction with the American Institute of Electrical Engineers, has issued the second edition of a circular relating to "electric wire and cable terminology." The loose method of utilising the word strand either for the wires making up the cable or the cable itself is wisely discredited, and the terms "strand" and "stranded conductor" are adopted, each with its distinct meaning. "Cord" is the name given for "a small cable, very flexible and substantially insulated to withstand wear," but one of the two illustrations of this shows a 7-strand cable, which would certainly not be considered a "cord" in this country, and the other illustrates what is known here as circular braided flex., with two conductors. On the other hand, what is called flex., or twin flex., in England is given the name "twisted pair," as a "special case of a 'cord';" and twin wire is the name given only to two small insulated conductors laid parallel under a common covering. An ordinary single cable made up of strands in the ordinary way is called, rather misleadingly, a "concentric lay cable" (in distinction to a "rope-lay" cable, of which the main strands are themselves stranded). Instead of the accepted terms concentric and triple-concentric, the terms 2-conductor and 3-conductor concentric are laid down, and a 3-core cable is called a "triplex" cable. "Twin cable" is confined to flat twin cable (with the two conductors parallel and not twisted), while the more usual sort of twin cable is called a "duplex" cable.

A note at the end of the circular refers to the calculation of the resistance and mass of a stranded cable. The convention adopted in the United States is that the resistance and weight are both 2 per cent. greater than the resistance and weight of the same number of straight single conductors of the same length, but the definition is very badly worded in the circular.

Obituary.—The death took place on Wednesday last week of Major S. Flood-Page, at the age of eighty-two years. After leaving the Indian military service Major Flood-Page took over the management of the Crystal Palace, but resigned in 1882, and joined the staff of Edison's Indian & Colonial Electrical Co. In the following year he became secretary and manager of the Edison & Swan United Electric Light Co. More recently Major Flood-Page interested himself in wireless telegraphy, and was on the board of the Marconi Companies.

Mr. David Smith, Managing Director of the United River Plate Telephone Co., and Director of the Constantinople Telephone Co., died last Saturday.

A Combined Power Factor Corrector and Reserve Plant.—A somewhat unusual arrangement is adopted at one of the steam auxiliary generating stations of the Southern Power Company, of North Carolina, in connection with a large power transmission scheme taking power from five water power stations. The auxiliary station at Mount Holly, which is described in the *Electrical World*, contains one steam turbo-alternator of 8,000 k.v.a. generating at 44,000 volts and connected by step-up transformers to the 110,000-volt transmission lines. At times when the station is not called upon to give out power the alternator of this set is kept running as a synchronous motor to improve the power factor of the system. The boilers are kept with banked fires, and the turbine warmed up so that as the alternator is already in synchronism, it can be put on load when required immediately by admitting steam to the turbine and regulating the excitation. A small turbine-driven independent exciter is provided, as well as a motor generator, from which excitation can be taken.

AN ELECTRICALLY DRIVEN TEXTILE MILL

THE advantages accruing from the adoption of electric driving of textile machinery are being more and more widely taken advantage of, and it is now pretty generally realised that the case does not turn on power economy alone, but that the application of electricity to the driving of such mills brings with it benefits in the way of convenience, efficiency, flexibility, reduction in capital cost, quietness, safety, and cleanliness, in addition to the important gains in rapidity of production and quality of the goods produced.

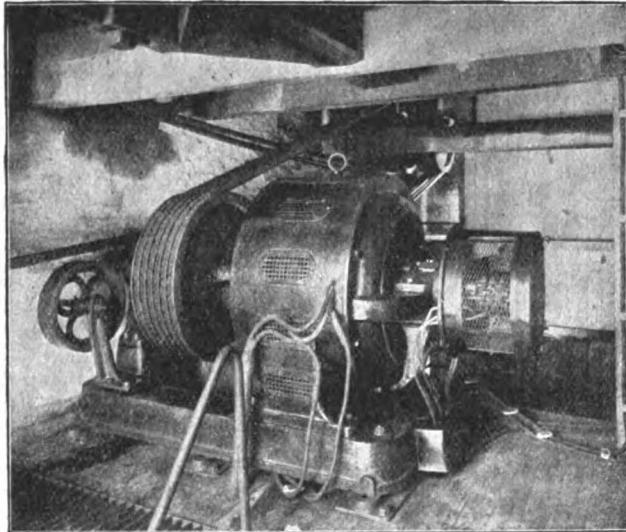

FIG. 1.—120-H.P. MOTOR DRIVING 6,000 SPINDLES.

An interesting example of electrical textile drive is found in the doubling frame installation equipped by the General Electric Co., Ltd. (Witton, Birmingham, and Victoria Bridge, Manchester), at the New Bridge Lane mills of Thos. Reynolds, Ltd., Stockport. In this installation the main "Witton" generator of 150-kw. capacity running at 385 r.p.m. delivers three-phase power at 500 volts, 25 cycles, and is driven direct through ropes from a main mill engine. On the same shaft is coupled a continuous-current generator, which supplies the excitation current for the alternator as well as continuous current for the lighting of the mill. The power from the

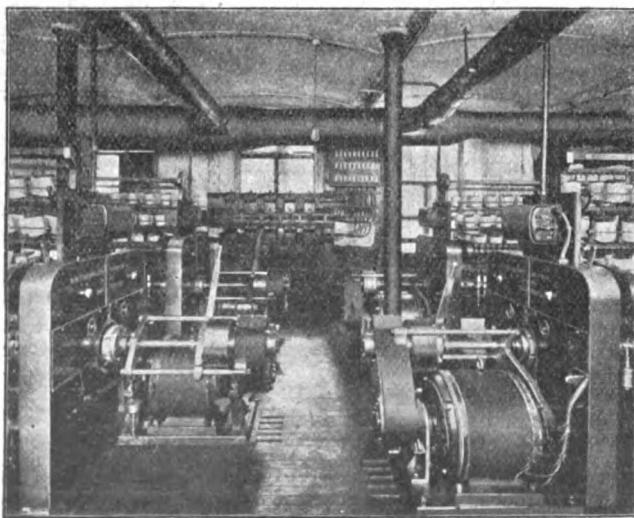

FIG. 2.—INDIVIDUAL MOTORS DRIVING DOUBLING FRAMES.

alternator passes through a main switchboard, where it is distributed to the electrically-driven portion of the mill. On one of these circuits is connected the 120-h.p. "Witton" three-phase slip-ring motor, shown in Fig. 1. This drives about 6,000 spindles from a central point, and runs at 490 r.p.m. It works in conjunction with two 45-h.p. water turbines. These turbines draw their water from the river Mersey, and an extremely ingenious arrangement has been adopted to overcome the variation in the water supply. The motor is of sufficient capacity to take the full load of the

6,000 spindles when the water supply fails. When there is a water supply available, the arrangement is such that the turbines take as much load as the water supply will permit and the motor develops the additional power. This is accomplished by means of a special clutch whereby when, through the scarcity of water, the speed of the turbines drops, they are instantly cut out and the motor takes the full load. As soon as the speed of the turbines comes up again, the clutch acts to effect engagement between the turbines and the motor, so that the load is shared as before.

From the main switchboard another circuit passes to distribute power in another part of the mill, wherein are installed ten doubling frames aggregating 4,000 spindles. These frames, which are illustrated in Fig. 2, are individually driven by three-phase squirrel-cage "Witton" motors taking power at 500 volts 25 cycles, and running at a speed of 1,490 r.p.m. Each motor is mounted on a bedplate complete with oil-immersed chain drive in a cast-iron case, which enables the tin roller shaft to be driven at the correct speed through a friction clutch and a flexible coupling. The drive is so arranged that by disconnecting the flexible coupling the whole gearing can be slung over approximately 45°, thus making the frame gearing accessible without in any way interfering with the motor or its gearing. The motors are run up to speed by star-delta starters of a simple compact design, which are conveniently situated in proximity to the motors. These starters are provided with mistake-proof devices which prevent the workmen inadvertently or inadvertently making a mistake in the starting-up operation, and fully protect the motor against damage. Main switches are placed in series with each motor. These are of the standard G.E.C. "Salford" pattern, complete with fuses.

This installation has solved for the owners a difficult problem, as the small headroom available would have made the installation of mechanical transmission very difficult. We understand that the owners are entirely satisfied with the application of electricity for driving their mill. We are indebted to Messrs. Thos. Reynolds, Ltd., for permission to reproduce the photographs of the installation and to publish this description.

London Power Supply.—On the suggestion of the Conference of Metropolitan Borough Councils owning electricity undertakings, the L.C.C. Special Committee on electricity supply is calling a conference for the purpose of discussing the most advantageous manner of dealing with the whole subject of electricity supply in London. It is possible that the companies will be invited to join. Incidentally, it may be mentioned that one or two counties outside London whose areas were included in the last L.C.C. Bill are making inquiries as to the possibility of promoting Power Bills themselves.

Dry Battery Manufacture in Germany.—A curious sidelight on the shortage of flour in Germany due to the war is thrown by information in German technical papers regarding substitutes that may be used for wheat or rye flour for thickening the electrolyte in dry batteries for pocket-lamps. For this purpose the following materials are recommended:—Glass-wool, sawdust, gelatine, starch, Kieselguhr, and water-glass. The following instructions are given for compounding the electrolyte:—140 grammes of well-powdered sal ammoniac, 40 grammes of zinc chloride, 10 grammes of ammonium sulphate are mixed together in a porcelain bowl with 10 grammes of thick refined glycerine. The mixture is then covered in small quantities with distilled water at a temperature of 40° C. and energetically stirred until the materials are dissolved into a concentrated solution. This mixture is allowed to soak into the binding material, and the paste so formed is filled into the cells, which are closed with a paraffined card top sealed with bottle-wax. In the cover two small glass tubes are provided for the escape of such gases as are generated within the cell. In compounding the electrolyte calcium acetate can be mixed with advantage with equal parts of the sal ammoniac. Such a solution possesses excellent conductivity, is hygroscopic, and does not crystallise or creep.

Magnetic Localisation of Shell Fragments.—At a recent meeting of the Académie des Sciences, Paris, a communication by M. J. Bergonité, describing a new method of localising shell fragments or other pieces of magnetic material in the human body, was communicated by M. d'Arsonval. A powerful alternating current electro-magnet is brought near the region affected, and the presence of a magnetic body within the flesh is indicated by a perceptible trembling of the surface at the immediate locality. By feeling the flesh the surgeon can easily find the spot where the trembling is strongest, and can thus locate the fragment of projectile with considerable accuracy. Experiments have been made with the apparatus in one of the French military hospitals.

ELECTRIC HEATING AND COOKING

A PAPER on "Electric Heating and Cooking Apparatus," by Mr. S. M. Hills, was read on Monday before the Junior Institution of Engineers. After some historical notes, the author explained the difference between radiators and convectors, and showed how, in some forms of electric fire, both methods of transmitting the heat were adopted as the convection air currents of heated air were given space to circulate through the back of the fire and round the glowing wire elements. In other cases convection is suppressed by limiting the access and egress of air, and nearly all the heat is emitted by direct radiation. Almost all non-lamp heater elements are wound with "nichrome" wire, and various methods of allowing for the expansion of the heated wire were employed in the design of the fire-clay or other support. It is of advantage to dispose the wires so that the fire-clay heats up gradually from one side, or there is a danger of the inner portions remaining soft and damp, and causing cracks by the imprisoned steam when in use. It is difficult to lay down a definite rule for the kilowatts required to heat a given room, but the following formula has been given by Mr. T. P. Wilmshurst :—

$$\text{Kilowatts required} = \frac{(30A + 8B + nC)20.4 \times t}{60 \times 60 \times 1,000}$$

where A =sq. ft. of window surface, B =sq. ft. of wall surface, C =cu. ft. of air in room, n =number of times air is changed per hour, and t =number of degrees F. air has to be raised in temperature.

The pleasant glow of the luminous radiator is popular among consumers, and a radiator gives a greater feeling of warmth than a convector of equal power, and heats up the surroundings in the lower part of a room more quickly than the latter, which sends its first instalment of heated air up to the top of the room. Tests have shown that electric heaters can heat up a room more rapidly than coal-fires, and have the advantage that, once heated, the energy given out can more easily be reduced to the value required to keep the room warm. Roughly speaking, 2 watts per cubic foot will heat a room up reasonably quickly, and half that amount is sufficient to maintain a comfortable temperature. The life of the heating elements varies from 2,500 to 4,000 hours.

With regard to cooking apparatus, the author generally preferred hot-plates of the enclosed or conduction type to the open or radiant pattern. Some curves, however, showed that the radiant hot-plate is more efficient for heating small quantities of water, but enclosed plates are better for larger quantities. The alloy of nickel and chromium known as "nichrome" is commonly used for the heating element, insulated with mica. Among points in the construction of hot-plates, the author mentioned the necessity for the top plate to be as thin as is consistent with freedom from buckling with rapid changes of temperature. The most usual source of trouble was in the connecting wires between the heating element and the terminal box. These should be of non-oxidisable material or the same material as the element, and at least three times the section of the element wire. The maximum loading possible is 25 watts per square inch, the limiting factor being the mica insulation, which will not stand a prolonged temperature above 700° F. The chief defect of hot-plates at present is that they are somewhat slow in boiling. The life of hot-plates is a variable quantity; some fail within a month, and others of the same make last a year or more.

The most satisfactory and popular part of the electric cooker is the radiant grill. A loading of 15 to 20 watts per sq. in. should be employed, and the element, which is usually assembled on fire-clay formers, should have as low a thermal storage capacity as possible.

In speaking of ovens, the author said that the unlagged bright oven had the advantages of cheapness and portability. It heated up quickly, but the lagged oven maintained its temperature with less expenditure of energy, and was, in his opinion, preferable for general purposes, although the largely-used bright oven had given much satisfaction. A loading of about 750 watts per cubic foot capacity was sufficient, and considerable range of regulation should be provided. A temperature of 350° F. should be attained in fifteen minutes. The elements could be placed at the bottom, sides, or top. The first arrangement, while giving good distribution of heat, was objectionable, as grease and water tended to collect on the element. It appears that among consumers in the north of England top and bottom heat is preferred, but side elements is favoured in the south. A good deal can be done with suitable deflectors to control the distribution of heat. Large elements with moderate loading per square inch are to be preferred. In the latest form of the "Tricity"

oven a ribbed hot-plate is used, which has a better radiating capacity, and gives better results than the older form.

The author favours the placing of the control switches on a control board away from the cooker itself, with fuses preferably of the cartridge type for every heating unit on the same board, together with indicating lamps for each circuit, and the leads to the cooker enclosed in flexible metallic tubing. A main double pole must also be provided. Several patterns of ironclad switch, fuse, and indicator box are now made on the unit principle, so that they can be assembled into control boards that can be added to at any time. It is, in the author's opinion, imperative that all cooking apparatus in the kitchen be effectively earthed, and particularly necessary that the earthing of no piece of auxiliary apparatus be omitted. There is now an increasing tendency towards the standardisation of all parts of the equipment, and this, in particular as regards the contacts of spare heating elements, will have a great influence on the success of electric cooking in the future. It should be as easy to change a heating element as a lamp.

Experience with a particular cooking installation for a household of four showed a daily average consumption of 1.47 units on the oven and 2.52 units on the hot-plate and grill. Figures given recently by Mr. R. Weaving before the Birmingham Electric Club were quoted showing that, comparing gas at 2s. 3d. per 1,000 cu. ft. with electricity at ½d. per unit, the ovens were favourable to electricity, but for boiling gas was cheaper. The difference was not very great in the ovens so long as they remained at full heat. This, however, is only used for running up to cooking temperature, which is only for a small portion of the time the oven is in use. While cooking is actually going on, the electric oven is costing 50 per cent. less than the gas oven. There was a movement in America to introduce thermostatically-controlled ovens, but these had not as yet found much favour in this country.

The latter part of the Paper dealt with electric water-heating, and described one or two forms of apparatus, including the continuous load type with thermal storage, the thermostatically-controlled tank heater, and the geyser type, in which the water is heated as required.

REVIEWS OF BOOKS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

Modern Illuminants and Illuminating Engineering. By L. Gaster and J. S. Dow. 462 pp. 9 in. by 6 in. 204 figures. (London : Whittaker & Co.) 12s. 6d. net; abroad 18s. 6d.

Engineering has been defined as common sense applied to the use of materials, and from prehistoric times onward, men have been applying varying amounts of common sense to artificial lighting; although it is only lately that a certain class of those whose business it is to arrange lighting schemes have dignified themselves by the title of illuminating engineer. The subject is, however, one that has developed enormously in the last few years as electric and other forms of lighting have been perfected, and an increasing amount of attention is being paid to the proper utilisation of the means which electrical, gas, and other engineers have provided. The authors deal with the subject from many points of view in this comprehensive work, which commences with a chatty little history of artificial lighting, and concludes with a variety of photographs of actual interior and exterior installations. The body of the book describes in detail many commercial forms of electric, gas, oil, petrol, and acetylene lamps, and a useful chapter sets in order one's ideas as to the physiological effect of light on the eye. Another important section deals with the quantitative estimation of light and illumination, incidentally describing many forms of photometer. Globes, shades, and reflectors are then dealt with. Having thus considered the production and measurement of light, the authors proceed to examine its application, and discuss in detail the apportioning of illumination with aesthetic satisfaction to practical needs.

If the work is a little discursive at times, we must forgive this in our appreciation of its completeness, and the valuable index that it forms both by means of references and a bibliography to the already extensive literature on the subject. It must be understood that the book attempts neither to be a scientific treatise on optics nor a manual for the lamp manufacturer, but there must be many to which it will appeal, as dealing generally with problems of practical illumination.

A Treatise on the Theory of Alternating Currents. By A. Russell. Vol. I. 534 pp. 8 $\frac{1}{2}$ in. by 5 $\frac{1}{4}$ in. 163 figures. (Cambridge: The University Press.) Second Edition. 15s. net; abroad, 15s. 8d.

In the first edition of this work, eleven years ago, Dr. Russell made it his object to collect together and examine the mathematical theorems which bear on the applications of alternating currents to practical work, and it is natural that in the present edition he has been obliged to extend his range to keep pace with recent developments. This applies more particularly to high frequency currents as used in telephony and wireless telegraphy. There has been a good deal of other revision, and several chapters have been entirely rewritten, and the mathematical treatment, which deals with such refinements as elliptic integrals and *ber* and *bei* functions has been in places somewhat extended. With the advance of modern developments, mathematics is becoming more and more the weapon of the engineer, as well as the delight of the theorist, and a book of this kind has more real practical value than might appear at first sight.

The Mathematical Analysis of Electrical and Optical Wave Motion. By H. Bateman. 159 pp. 8 $\frac{1}{2}$ in. by 5 $\frac{1}{4}$ in. 6 figures. (Cambridge: The University Press.) 7s. 6d. net; abroad, 7s. 10d.

The author deals with recent developments of Maxwell's electromagnetic theory directly connected with the solution of the partial differential equation of wave motion, but stops short of the higher developments of the theory, which are based on the dynamical equations of motion. Part of the latter portion of the book bears on the problem of the structure of the aether, and the difference between positive and negative elementary static charges, and not the least interesting part is the author's own work on the subject.

Submarine Vessels, including Mines, Torpedoes, Guns, Steering, Propelling, and Navigating Apparatus. By W. E. Dommett. 106 pp. 7 $\frac{1}{2}$ in. by 4 $\frac{1}{2}$ in. 21 figures and 16 plates. (London: Whittaker & Co.) 1s. net; by post, 1s. 2d.

At the present time this little work will appeal to many who wish to know more about the weapon of naval warfare, which has been developed to such perfection by the British Navy and put to such base uses by the Germans. Its style is much better than the usual book on technical matters addressed to the non-technical public, and in particular the short section on the electrical means by which under-water propulsion is effected is clearly written, although of necessity many things that electrical engineers will want to know are left unexplained. Some interesting exploits both of our submarines and in the way of defence against the "U boats" of the enemy are hinted at, but here again it is not good for us, at present, to know too much.

Advertising and Progress: A Defence by E. S. Hole, and a Challenge by J. Hart. 271 pp. 8 $\frac{1}{2}$ in. by 5 $\frac{1}{4}$ in. (London: Review of Reviews.) 5s. net; abroad, 5s. 5d.

One of the main objects of the authors of this book is to destroy the "superstition" that the consumer pays for advertising, and to advance the contrary proposition that "the burden of successful advertising is borne by the unprogressive manufacturer or merchant, who is unable to recognise the advantages of good advertising, and a part of whose trade is taken by the successful advertiser." This contention may seem remarkable, but a perusal of the work, which reveals an absolutely new and unconventional treatment of the subject, will convince many readers that it is by no means unjustifiable.

The authors are even fortunate in their mistakes. Advertising is likened to the flywheel of an engine, on the absolutely unparable supposition that the flywheel increases the available power for the same expenditure of fuel. But the analogy is a very suitable one, nevertheless. A heavy flywheel not only enables the engine to meet momentarily excessive demands upon it, but can also prevent waste of energy and fuel during momentary diminutions of output.

The book was written and published before the war. Had it been written later, the authors could have pointed out that the manufacturers who had been regular and ubiquitous advertisers suffered the least by the commercial upheaval of last August. There will be another critical time when the war is over, and then those who have advertised consistently and persistently during the war period will have the least cause for anxiety.

Portland Cement.—A new edition of the British Standard Specification (No. 12) for Portland cement has been issued by the Engineering Standards Committee, and can be obtained at the price of 5s. Certain changes in the minimum allowable tensile strengths and the construction of test briquettes have been made, and the growth of tensile strength with time is specified in a new formula.

MARKETING GOODS ABROAD

AT a meeting of the Sales Managers' Association on Friday, Mr. C. Hamilton Wickes, H.M. Trade Commissioner in Canada, gave an address in which he outlined some of the difficulties from which British manufacturers are suffering in their trade relationships with foreign countries and the Colonies. In March Mr. Wickes was good enough to afford us a special interview (ELECTRICAL ENGINEERING, March 11th, p. 109), in which he discussed with our representative some of the trading conditions in Canada, particularly in respect to the electrical industry. In his address on Friday, however, Mr. Wickes was more general, and did not deal with any specific industry, foreign country, or colony. Mr. Arthur M. Samuel, who was in the chair, urged the adoption of the decimal system of weights and measures as likely to facilitate trade abroad, and also pleaded for a change in our educational system as regards salesmen sent out from this country. As an instance he deplored the lack of an institution in this country for the training of young men in Oriental studies, having regard to the enormous trade carried on between this country and India.

Mr. Wickes said that British trade to-day was largely permeated with the leisurely ideas which held sway during the eighteenth and the early part of the nineteenth centuries. At the same time the necessity for some change in our method was now being recognised. The criticism which had often been made of our Consular service, although to a certain extent true, did not absolutely strike at the root of the matter. The manufacturer himself was very largely to blame in many respects. The great drawback to British trade abroad had been the class of salesmen sent out from this country, or the absence of merchants to deal with the goods, especially those of the heavier kinds, which did not pass through the hands of a retailer but went direct from the importer to the user. It was a curious fact that in those countries where British goods were adequately represented by merchants we held our own quite easily with foreign goods, but the reverse was the case where the merchants dealing with British goods were not sufficient. In order to get over this difficulty he suggested that firms manufacturing different goods, but coming within a similar category, should combine and make arrangements with a merchant in those countries where they were not at present obtaining a sufficient volume of trade who would adequately represent their interests. Another matter which must be re-arranged was that of credit. The number of British firms who would give credit to the extent that other countries did were few and far between, and the representatives of the U.S. Commissioners of Trade attributed a great deal of the success of American goods to the credit extended to customers. Another outlet for British trade abroad was that where loans were asked for in this country, there should be some stipulation that the goods should be purchased here. For instance, the recent Canadian loan of £5,000,000 for wharves and landing-stages at Halifax and St. John, so readily taken up here, did not have any condition attached that the necessary plant and machinery should be purchased in this country. British manufacturers should also take the trouble to translate their money values into those of the country where the price lists were sent, and particulars should also be given as to freightage costs, so that the buyer knew exactly what the goods would cost him in his own town. It was a curious thing that the British shipping companies did not issue a freight list, and most exporters had to adopt the freight list issued by the German shipping companies as a guide. Mr. Wickes hinted at the necessity for some change in our fiscal system on behalf of British trade, and also some restrictions upon foreign firms being allowed to trade here under British names and competing in our domestic markets with imported goods.

Glass Manufacture.—The Council of the Institute of Chemistry has published a report dealing with the work of the Glass Research Committee appointed last October to conduct investigations as to the best formulæ for the composition of laboratory glassware, miners' lamp glasses, combustion tubing, resistant glass for pharmaceutical products, glass for X-ray bulbs, &c. An immense amount of experimental work has been done in arriving at these, with the result that full information is now available for the manufacture of all the important glasses used in the laboratory and for industrial purposes, which have hitherto been mainly obtained from abroad. Copies of the report can be obtained from the Registrar, Institute of Chemistry of Great Britain and Ireland, 30 Russell Square, W.C.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,438.

Could any reader describe in detail the apparatus used in taking the ohmic resistance of an electrolyte of fused salts, especially the apparatus containing the salt?—"ELECTROLYTE." (Replies must be received not later than first post, Thursday, April 22nd.)

ANSWERS TO No. 1,436.

I have recently been testing a small four-pole revolving-armature three-phase generator (A.C.). During the tests the question arose as to whether the machine was star- or mesh-connected. Several methods of ascertaining this were suggested, but none gave conclusive results. Is there any conclusive test which can be simply applied?—C. W.

The first award (10s.) is given to "M. M." for the following reply:

Presuming it is impossible to follow course of windings, we must have recourse to an electromagnetic method. It might at first be thought that the desired result could be attained by measurement of resistance, i.e., by taking resistance between ring *a* and ring *b*, and then between *a* and rings *b* and *c* joined together. This, however, gives same ratio both with star or mesh. As we do not know resistance per phase, this is of no use. An electromagnetic method is as follows:—Send a current from ring *a* to ring *b*; if the armature exhibits polarity (which may be made evident by a small compass), armature is in mesh. If in star, the effect due to one phase would be wiped out by the magnetic effect due to the other. Now connect—that is, short-circuit—rings *b* and *c*. Send a current from ring *a* to the rings *b* and *c*. If the armature is in mesh, it will exhibit two poles; if in star, there will be no polarity, as the return flowing back through two phases will neutralise current in remaining phase.

No second award is made.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

A further article by Lieut. A. A. Jayne, "With the Expeditionary Force," appearing in the April number of the *Telegraph and Telephone Journal*, gives evidence of the importance of the field cable work, and the coolness and intrepidity of the men engaged on it. Repairs have to be executed in areas immediately behind the trenches, swept by rifle fire, "Jack Johnsons," and shrapnel. To be a passive target in

an open field and at the same time to make a good joint in a wire is surely a good test of courage.

Along the trenches telephonic communication is usual, and the operators may find themselves in the thick of the fighting; if a trench has to be vacated, the telephone man is not by any means the first out, as he must not leave his speaking set behind. A Divisional Signal Company consists of headquarters and four sections. No. 1 Section consists of three cable detachments, who connect four divisions to each of the three brigades, and the remaining three sections called Brigade Sections communicate with the battalions in each brigade, in the trenches or wherever they may be. Each Brigade Section has two telephone detachments and eight despatch rider cyclists. The telephone detachments have a pack mule or pony, which carries three miles of cable.

From the Brigade Headquarters to the trenches, or wherever the battalion headquarters may be, cables are at first laid out on the ground. This where possible is done at night, cable D 5 gauge being used. Afterwards they are lifted on to 'sticks.' It is not at all an easy matter to lay cable during the night, as may be supposed. There are small woods, undulations in the land, ditches, and dykes to negotiate; men being relieved from the trenches and others passing along to effect the reliefs, ration parties, and other difficulties have to be contended with. During this first stage of communicating with the trenches the cable is pegged down to the ground. Obviously it must lie evenly on the ground everywhere or someone may trip up and break it. When roads are crossed the cable must be raised at least 15 feet—soldiers going to their posts in the dark often use the cable as a guide or they inadvertently walk into a pole at a crossing—in both cases some derangement of the line frequently takes place. After a time troops learn to avoid the cable, and similarly, when it is known what tracks are being used, the cable is raised on poles and moved out of the way. Often during the night the linemen have to grope along to trace and repair a fault caused by shell fire.

No. 1 Section marches with the brigade when they are on the move, and communication with the division is kept up by means of the cable, which is continually run out, often on to the side of the road. When, however, the various headquarters remain stationary, any permanent lines that may be running along the route are utilised. This is easily accomplished because it is known that only the enemy is in front, and therefore no inconvenience will be occasioned to people that matter by cutting and terminating the wires. Of course, it frequently happens that there are no permanent wires along the road, and then cables on poles are used. The number of poles carried by a section is limited, and hop poles and props are borrowed or bought from farmers and others. Suitable sticks are also cut from hedges, &c.

From Divisional Headquarters to Brigades buzzers are worked, but on the lines to Corps Headquarters single current sounder sets are now being used. From the Army Headquarters to the Corps, where there is frequently very heavy traffic, the Second Class Office baseboard set has actually been converted to duplex. The capacity on such lines is negligible, and the insertion of a rheostat for the compensation circuit acts splendidly. All that is necessary is to move the sounder from the baseboard for the convenience of the receiving telegraphist and in its place put the rheostat.

Among the examples of dangerous work mentioned, the following is worth quoting:—"On one occasion it was the duty of a section to proceed up a road across an open field and down another road, thence to connect with its headquarters. The cable wagon laid the cable down the first road and turned into the field and immediately became the centre of shell fire. The only thing to do was to clasp on speed and pay out the cable. Away jolted the wagon and got across when the officer discovered that his small stock of poles had slipped off. 'About turn and pick up poles.' Again the area shelled was successfully done and they started down the next road. 'Don't you go down that road,' shouted a despatch rider, 'Jack Johnsons are coming straight up the road like hailstones.' 'All right,' said the officer, 'we will pay out under this ridge.'"

An article by Mr. J. H. Watkins in the April number of the *Post Office Electrical Engineers Journal* describes a call-office call-box for use on automatic exchanges. The caller "dials" for the number he wants, and can hear the called subscriber's reply, but until he has deposited his penny there is a short-circuit across the call-office transmitter, so that he himself cannot speak on the line. In addition, there is a 30-ohm shunt across the receiver, so that this cannot be used as a transmitter.

According to the *Yorkshire Observer*, the installation of the automatic exchange in Leeds has had to be postponed. Among the reasons given is the large number of men who have been taken for telephone and telegraph purposes in France and the urgent need for placing the telephone and telegraph wires in Leeds underground. The latter is considered more important than installing the automatic exchange.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 8th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

6,443/14. Tramcar Brakes. A. W. E. MALEY and G. N. CADBURY. A regenerative electric brake and a track brake are controlled by the same handle, preferably the handle of the driving controller, in such a way that the regenerative brake cannot be applied before the track brake, nor so as to produce skidding. (Three figures.)

6,659/14. Telephony. T. G. MARTIN. A system of cord circuit connections for semi-automatic telephone systems, in which the working of the "busy" signal is not dependent on the position of the operator's listening key. A supervisory relay is arranged to be energised in series with the line relay of the connecting switch, and means are associated with the connecting switch for alternately applying the signal current and short-circuiting the supervisory relay so as to give the busy signal. (One figure.)

13,348/14. Electrically-heated Vulcaniser. W. T. HENLEY'S TELEGRAPH WORKS CO., LTD. and H. SAVAGE. An electrically-heated apparatus for vulcanising cable joints, tyres, &c., by immersion in a bath of molten wax, having a vulcanising vessel within an outer vessel, in which are placed the heating resistances. (Three figures.)

19,878/14. Insulating Material. W. TEGGIN and LONDON ELECTRIC WIRE CO. & SMITH'S, LTD. This material is composed of superimposed combed or carded cotton wool or a mixture of cotton and wool on asbestos sheet, the whole impregnated with rubber solution under pressure. (Two figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: COLLIS and CROMPTON & CO. [Protective apparatus] 9,065/14.

Electrometallurgy and Electrochemistry: GMÜR-ZEHNDER [Resistance furnaces] 23,495/14.

Heating and Cooking: QUAIN [Heaters] 4,017/14; NEGUS and NEGUS [Ovens] 9,213/14 and 1,376/15.

Switchgear, Fuses and Fittings: COLLINSON [Resistances] 29,622/13; GOLBY (Wizard Electric Lamp Co.) [Lamp stand] 4,758/14; WEISSMANN [Lamp supports] 7,311/14; CURTIS, MACKLEY and IGRANIC ELECTRIC CO. [Controllers] 20,132/14.

Traction: STABIE [Train control] 4,131/14.

Telephony and Telegraphy: BETULANDER AUTOMATIC TELEPHONE CO. and BRYANT [Impulse transmitters] 7,218/14; WESTERN ELECTRIC CO. (W.E. CO., U.S.A.) [Printing telegraphs] 7,907/14; PRITCHARD [Telephone transmitters] 7,974/14; PLEIJEL and OLSSON [Loading duplex telephone circuits] 8,184/14.

Miscellaneous: GREVILLE [Current control for electro-medical purposes] 4,542/14; SCOTT [Electrical steering gear] 6,424/14;

CATALOGUES, PAMPHLETS, &c., RECEIVED

GEARING.—A well-illustrated booklet from David Brown & Sons (Lockwood, Huddersfield) gives a very large amount of information regarding double helical gear and its application as a high-efficiency speed reducer.

THE BRILL MAGAZINE.—The last number of this interesting publication of the J. G. Brill Co. (Philadelphia), whose name is known all over the world in connection with tramcar trucks, &c., contains a number of illustrated articles describing rolling stock and other features of American electric interurban and street railways.

LIQUID STARTERS.—Two forms of liquid type motor starters are described in a leaflet from J. H. Holmes and Co. (Portland Road, Newcastle-on-Tyne).

DYNAMOS AND MOTORS.—A leaflet from the Millns Elec-

HARDING [Indicating apparatus] 8,526/14; CAMPBELL [Electric safety control for steam engines] 10,516/14; ESTER & CO. and STROHMEYER [Apparatus for converting electric currents] 20,308/14; FARNSWORTH and SCHUSTER [Vapour electric devices] 1,869/15.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Heating and Cooking: LANDIS & GYR A.G. [Electric heating and cooking apparatus] 3,855/15.

Switchgear, &c.: BOZZETTI [Switches] 4,012/15.

Telephony and Telegraphy: DIXON [Printing telegraph receivers] 3,987/15; HULTMAN [Automatic telephone exchange system] 4,285/15.

The following Amended Specifications can now be obtained:—

Instruments: B. T.-H. CO. [Induction meters] 16,409/04.*

Telegraphy: G. O. SQUIER ["Wired" wireless telegraphy] 17,487/14.

Opposition to Grant of Patents

22,331/13. Lamp Filaments. C. O. BASTIAN. A grant has been allowed on this application, in spite of opposition. The specification describes helically-wound drawn-wire filaments, in which the wire is provided with a coating during preparation to keep the convolutions apart. This coating is removed after mounting the filament.

7,677/14. Resistances. J. COLLINSON. A grant has been allowed on this application, in spite of opposition. The specification describes a method of construction of grid-type resistances.

21,029/13. Lamp Filaments. C. O. BASTIAN. A grant has been refused on this application. The specification describes lamps with wire filaments in helical form, with the convolutions arranged at a distance from one another equal to, or less than, one-half the diameter of the wire.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

7,966/01. Train Control. E. R. HILL. This patent covers a number of improvements in details of electro-pneumatic multiple unit control systems for electric trains.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: F. DIXON [Flywheel power equalisation] 28,349/04.

Dynamos, Motors and Transformers: ELEKTRICITÄTS A.G. VORM, W. LAHMEYER & CO. [Single-phase motors] 25,393/05.

Heating and Cooking: B.T.-H. CO. (G.E. CO., U.S.A.) [Heating apparatus making use of iron losses as well as resistance] 29,120/06.

Telephony and Telegraphy: J. PETICKY, L. CIZEK, and F. SUCHÁNEK [Automatic telephones] 28,036/04; F. RITCHIE [Electric order telegraph] 28,254/04; J. PETICKY, F. SUCHÁNEK, and L. CIZEK [Automatic telephones] 11,497/09; E. BLOS [Automatic telephones] 29,801/09; AMERICAN AUTOMATIC TELEPHONE CO. and C. L. GOODRUM [Automatic telephones] 29,963/09.

trical Co. (37 and 38 Strand, W.C.), which business was recently started by Mr. P. N. Millns, late of the Adnil Electric Co., Ltd., gives prices of a line of British-made continuous-current dynamos and motors from $\frac{1}{2}$ to 300 h.p. These machines are all fitted with interpoles, and a large number of ratings are standardised. We understand that very prompt delivery can be given.

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

TELEPHONE CARD.—A neat telephone card is being issued by the County of London Electric Supply Co., Ltd., on which the telephone numbers of the Company's head and branch offices are printed, and space left for filling any numbers likely to be in frequent use.

DYNAMOS AND MOTORS.—A list of continuous-current dynamos and motors of moderate size is to hand from Higgs

Brothers (Dynamo Works, Sherbourne Road, Balsall Heath, Birmingham). The list contains full specifications of the firm's machines, and a very convenient way of listing the outputs by means of an output factor for each size of carcase to be multiplied by the speed within a certain range is used.

DYNAMOS AND MOTORS.—A considerable number of continuous and alternating current machines ready in London for immediate delivery are detailed in a special stock list from Marples & Leach (26-30 Artillery Lane, E.C.).

STEEL WIRES.—A new list of steel wires, rods, &c., for hardening and tempering is being issued by W. H. Brunton and Son (Musselburgh, Scotland), who will send a copy to any of our readers who are interested.

FANS.—A new illustrated descriptive price list of electric fans has been issued by the British Thomson-Houston Co., Ltd. (Rugby), and includes fixed and oscillating bracket and table fans, for alternating and continuous current, as well as porthole pattern exhaust fans, ceiling fans, and other special designs. The oscillating movement is obtained by positive gearing and is not dependent upon air reaction.

SUPPLIES AND NOVELTIES.—Leaflets from Krupka & Jacoby, Ltd. (39 Victoria Street, Westminster), deal with enamelled iron shades, flash-lamp novelties, and pocket-lamp batteries. Special attention should be drawn to a miniature flash-lamp, resembling a fountain-pen in appearance, 5*g* in. long and 11/16 in. in diameter.

THE SPRINKLER BULLETIN.—The last issue of this quarterly publication of Mather & Platt, Ltd. (Manchester), deals to a large extent with electrical matters and gives illustrated descriptions of a number of forms of continuous and alternating current motors made by them, as well as generating plant and a variety of electrically-driven machinery. Electrical driving is also dealt with in the sections devoted to the pump and textile departments. It is interesting to note that 525 of the firm's staff and employees have joined the Forces.

POCKET WAR MAPS.—A useful little booklet of maps of the areas of war, which incidentally calls attention to their cables and other products, is being circulated by W. T. Henley's Telegraph Works Co., Ltd., Blomfield Street, E.C., and will be sent to any of our readers who apply on their printed letter heading.

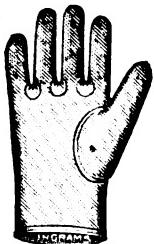

DYNAMOS.—An illustrated descriptive pamphlet from the British Thomson-Houston Co., Ltd. (Rugby), deals with their latest pattern of multipolar continuous current generators of moderate size, giving full specifications of their construction, with dimensions and weights.

METAL FILAMENT LAMPS.—The British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.), have issued revised price lists of British-made Mazda drawn wire lamps, including ordinary, high candle-power, candle, tube, sign, marine, and traction lamps, and also a list of "half-watt" lamps in sizes from 100 to 500 watts for 50 to 60 volts, 200 to 1,500 watts for 100 to 130 volts, and 500 to 1,500 watts for 200 to 225 volts. These lamps are also made at the company's factory at Rugby, which is briefly described in a leaflet accompanying the price lists.

Islington Civic Guards.—Hearing that this body are looking round for a rifle range, Messrs. A. P. Lundberg & Sons have offered the free use of a very suitable strip of ground adjacent to their Pioneer Electrical Works. The matter has been referred to the Parliamentary Committee of the Islington Borough Council.

INGRAM'S INDIA-RUBBER GLOVES and GAUNTLETS FOR ELECTRICAL PURPOSES

NON-CONDUCTING.

Made in
all sizes of
Ordinary & Stout
Substances
to suit varying
Volts.

BEST QUALITY
INDIA-RUBBER.

Prices on Application.

Manufacturers—

J. G. INGRAM & SON, Hackney Wick, LONDON, N.E.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Abercynon.—Tenders for the following are required:—E.H.T. underground cables, L.T. overhead lines, and public lighting; E.H.T. and L.T. switchgear and transformers. Consulting Engineer, H. H. McLeod, Portishead, near Bristol. April 26th.

Ballymena.—The Treasury has sanctioned a loan of £3,800 for an electric lighting installation for the Guardians.

Bexley.—A 50-kw. rotary converter is to be installed at an estimated cost of £350. The bulk of this is to be met out of revenue and the balance out of unexpended borrowing powers.

Dover.—A L.G.B. inquiry concerning a loan of £6,000 for a new generating set was held yesterday. In anticipation of the possibility of the loan being refused in present circumstances, the Borough Electrical Engineer has been considering what other steps he can take to meet the demands for which the new generating set is required.

East Grinstead.—An inquiry was held last week into the Council's application for an Electric Lighting Provisional Order. The estimated expenditure is £10,000.

Ireland.—A few further particulars are available of the electric power scheme for Ireland, referred to on p. 147 of our issue for April 1st. It is stated that all the agreements for the necessary land have been signed, but that it is not the present intention to go to the public for any part of the £2,000,000 capital. Presumably, however, the Company will have to go to Parliament to enable it to carry the scheme out.

Leigh (Lancs.).—A loan of £2,813 is contemplated for plant extensions.

Middleton.—An expenditure of £3,000 is contemplated on mains.

Wigan.—A loan of £6,000 is required for two new boilers at the electricity works.

Wiring

Edgware.—Wiring of Redhill Institution for Hendon Guardians. Clerk, Union Offices. April 29th. (See an advertisement on another page.)

Hull.—Wiring and fittings for secondary school, Cottingham Road. City Architect. April 29th.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Ayr.—Hospital, Hunter's Avenue.

Dundalk.—County offices.

London.—School at Tulse Hill. Architects, Hine & Pegg, 35 Parliament Street, S.W.

Stockport.—New offices for Prudential Assurance Co.

Miscellaneous

Australia.—The Melbourne Electric Supply Committee requires 1,207,900 arc lamp carbons. Further particulars at 73 Basinghall Street, and tenders to Messrs. McIlwraith, McEacharn & Co., Biliter Square Buildings, E.C., by April 21st.

Great Indian Peninsula Railway Co.—Twelve months' supply of lamps and fittings. Secretary, 48 Copthall Avenue, E.C. April 22nd.

Spain.—Six electric cranes and four electric capstans. Tenders to the Presidente de la Junta de Obras del Pantano del Chorro, Alameda 13-15, Malaga. Further particulars at 73 Basinghall Street, E.C.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Aberdare.—The following tenders have been accepted:—Cables, joint boxes, &c., Callender's Cable & Construction Co.; meters, Landis & Gyr; oils, Vacuum Oil Co.

Belfast.—A twelve months' contract has been placed with Venner Times Switches, Ltd., for time switches.

Croydon.—The Tramways Department has placed a con-

tract with Siemens Bros. Dynamo Works for a twelve months' supply of Wotan, Tantulum, and carbon filament lamps.

Hove.—The Electricity Committee recently invited tenders for a turbo-generator. The tenders received show that the prices are generally higher by some 20 per cent. than three months ago, whilst all dates for delivery are provisional. Taking this into consideration, together with the Treasury request that capital expenditure should be curtailed, the Committee recommend that the installation of the proposed set should be postponed until a later date. The Committee, however, is of the opinion that a battery should be installed, and the tender of the Tudor Accumulator Co. at £701 is recommended for acceptance.

London: Hammersmith.—Ten firms tendered for meters, and that of the Electrical Apparatus Co. for a supply for three years is recommended for acceptance. The prices of the successful tender are:—3-ampere meters, 24s. each; 5-ampere, 24s. 6d.; 10-ampere, 25s. 9d.; 25-ampere, 28s. 6d.; 50-ampere, 36s.; 75-ampere, 43s. 6d.; 100-ampere, £2 10s. 6d.; 250-ampere, £4 6s.; and 500-ampere, £5 1s.

Mile End.—The tender of Baxter & Caunter, the only firm tendering, has been accepted by the Guardians for electrical fittings at £114 18s.

Pontypridd.—Contracts have been placed with Messrs. Lucy & Co. and the British Insulated & Helsby Cables, Ltd., for joint-boxes and cut-outs.

Tunbridge Wells.—A contract is to be placed with the British Thomson-Houston Co. for a 300-kw. steam alternator and condensing plant at £3,132.

Messrs. Ferranti, Ltd., have received orders for ordinary and prepayment meters for the year to March 31st, 1916, from the Bristol, Croydon, Londonderry, Plymouth, and Whitehaven Corporations, the Hammersmith Borough Council, and the Ilford Urban District Council.

The Mansfield Corporation and the Walthamstow and Holyhead Councils have placed orders for Chamberlain & Hookham meters for twelve months with Messrs. Venner & Co.

APPOINTMENTS AND PERSONAL NOTES

The Royal Society of Arts has conferred the Albert Medal upon Mr. G. Marconi for his services in connection with wireless telegraphy.

Mr. V. F. Bush, Assistant Mains Engineer at West Ham, has been appointed Assistant Electrical Engineer at Redditch at a salary of £170 per annum.

Mr. H. C. Ashton, who was appointed in September as temporary meter assistant in the Hammersmith Electricity Department in the absence of Mr. H. R. Watts, enlisted, is to be placed upon the permanent staff and transferred to other work on Mr. Watts's return, at a salary of £175 per annum.

A shift engineer is required at Wednesbury; an engineer for a works in Wales; and assistant electrician at the Park-end Deep Navigation Collieries; and wiremen by John Brown & Co.

LOCAL NOTES

Belfast: Electricity Staff Reorganisation.—The Electricity Committee, which has had the reorganisation of the Electricity Department under consideration for some eighteen months, has now, through inability to agree upon a scheme, been compelled to ask the Corporation to deal with the matter in Committee. It appears from a report by the Committee which was on the agenda at the last meeting of the Corporation that four members of the Committee had voted for a

motion, and eight against, that no scheme should be submitted which included the Chief Electrical Engineer in his present position. Another motion, however, that the present Chief Assistant be relieved of his duties and assigned to others was passed, together with a recommendation for the appointment of a Chief Assistant Engineer to be mainly responsible for all electrical and mechanical repairs, at a salary of £450 per annum. In the course of a short discussion at the last meeting of the Corporation, during which this report was deleted from the agenda, leaving the Corporation to deal with the matter completely, it was pointed out that no charge had been preferred against Mr. Bloxam by the Committee.

Boston: Electric Lighting.—The Board of Trade, in sanctioning the Council's application for an Electric Lighting Order, has stipulated that it cannot come into operation before the close of the war.

Chichester: Reduced Street Lighting.—In reply to the Council's application for a reduction in the charge for public lighting owing to the fewer number of lamps in use, the Chichester Electric Lighting Co. points out that the increased cost of generating the public lighting units since the war has amounted to £267, against which the saving effected by the Company does not exceed £70. The Council has deferred the next payment for public lighting under the contract until some arrangement has been arrived at, but the directors retort that there is no legal or other justification for such an action.

London: Marylebone: Increased Charges.—The Electric Supply Committee recommends an increase of 10 per cent. in their charges, the reason being that they expect a considerable reduction in the private lighting demand in the near future.

Newport (Mon.): Electricity Estimates.—Mr. A. Nichols Moore, the Borough Electrical Engineer, states that since the presentation of the annual estimates for 1915-16, which show a net loss of £1,164, the price of coal has steadily advanced and seems likely to go still higher. The loss mentioned above was arrived at by taking coal at 12s. per ton. We understand that the Committee recommends an increase of 20 per cent. in the charge for current after the June quarter.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £78 10s. to £79 10s. (last week, £76 10s. to £77).

Advance in Prices.—The Sterling Telephone & Electric Co., Ltd. (210-212 Tottenham Court Road, W.), announce a general advance of 10 per cent. on their catalogue prices with the exception of a few special items, for which new list prices are in force.

Liquidations.—A meeting of Safety Light, Ltd., will be held at 62 London Wall, E.C., on May 10th, at 12 noon, to hear the liquidator's account of the winding up.

German Trade.—The Imperial Trade Correspondent at Quebec reports having received inquiries from seven firms in Canada respecting the transfer of their trade from German and Austrian to British manufacturers. The goods dealt in include electrical apparatus of all kinds. Further particulars at 73 Basinghall Street, E.C.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Companies Struck off Register.—The name of the Automatic Telephone Co. is to be struck off the register of joint stock companies at the end of three months. This, of course, is not the Automatic Telephone Manufacturing Co., whose accounts for 1914 were dealt with in our issue for April 1st, p. 145.

London Electric Supply Corporation.—The shareholders are being offered £100,000 four per cent. first mortgage debenture stock at 85 per cent. The Treasury has given sanction to this issue, which is required mainly in connection with liabilities upon plant for the electrical working of the London, Brighton & South Coast Railway.

SUMMARY

We invite readers to enrol themselves in the "Electrical Emergency Service." The object of the Service is to provide part-time volunteer switchboard attendants, and so to release men who have hitherto been refused permission to join the Colours (p. 170).

EXTENSIONS of plant have been recently installed in the Carlisle electricity works, including a high-speed turbo-alternator with rotary wet-air filter, two rotary converters with special arrangements for running inverted, and a new form of voltage regulator (p. 171).

IN a Paper on "Artificial Illumination and Architectural Effect," last week, Mr. S. D. Chalmers disapproved of completely concealed methods of lighting (p. 172).

A PAPER on "Electric Power in India," by Mr. H. R. Speyer, reviews the causes of backwardness of the conversion of the cotton and other mills to electric driving, and discusses the conditions of electric power supply in that country generally (p. 172).

AT the annual meeting of the Electrical Trades Benevolent Institution on Monday, Mr. E. Garske called special attention to the slow progress of the Fund, and suggested various methods of increasing the income (p. 173).

SOME technical books are reviewed in this issue (p. 173).

A PROPOSAL for revised power charges in Bedford, made by the Electricity Committee, was opposed by the Mayor last week, but was carried notwithstanding.

During the discussion the Town Clerk expressed the opinion that a coal clause was not admissible in a power contract unless it applied to all consumers alike (p. 173).

ACCEPTANCE test for generators are discussed in our Questions and Answers columns (p. 174).

AMONG the subjects of specifications published by the Patent Office last Thursday are resistances, heaters, and the loading of duplex telephone lines. A patent for a cut-out for inserting substitutional resistances in arc-lamp circuits, and an automatic telephone patent, expire this week after a full life of 14 years (p. 175).

AN article on telegraphy in war time is reviewed (p. 176).

FURTHER joint working of the London Tube Railways is proposed (p. 176).

REFLECTORS for shop window lighting are described in our Trade Section, which also contains an illustrated article on a half-watt lamp installation and a new system of electrical heating and ventilation (p. 179).

AN expenditure of £30,000 is contemplated at Waterford; £500 at Carnarvon; and £1,300 at Clacton. Generating plant is required in New Zealand (p. 179).

THE repair shops at the Stuart Street power house of the Manchester Corporation have been offered to the Government for the manufacture of shells.—The scheme of reorganisation at Belfast has been referred back to the Electricity Committee. The Dublin Corporation is also asked to reorganise the Electricity Department.—Edinburgh's coal bill will be up by £10,000 for the current year.—Difficulties through enlistments are being experienced at Dundee and Ealing (p. 180).

Arrangements for the Week.—Saturday, April 24th.—Association of Mining Electrical Engineers, Notts and Derbyshire Branch, University College, Nottingham. "Protective Devices Against Lightning and Surges," by E. K. Scott and L. F. Fogarty. 3.30 p.m.

Tuesday, April 27th.—Institution of Electrical Engineers, Manchester Section Annual Meeting, Engineers' Club. "The Bombay Hydro-Electric Scheme," by A. Dickinson. 7.30 p.m.

Association of Supervising Engineers, St. Bride Institute, Fleet Street, E.C. "Lightning Conductors," by H. C. Hands. 8 p.m.

Illuminating Engineering Society, at Royal Society of Arts, John Street, Adelphi. "Visibility: Its Practical Aspects," by C. C. Paterson and B. P. Dudding. 8 p.m.

Wednesday, April 28th.—Institution of Electrical Engineers, Birmingham Section, at the University. "The Bombay Hydro-Electric Scheme," by A. Dickinson. 7.30 p.m.

Institution of Railway Signal Engineers, at I.E.E., Victoria Embankment. Continued discussion on "A Review of the Art of Signalling and Some Suggestions," by Mr. Bound. 2.15 p.m. "Dynamicals," Trocadero Restaurant. Anniversary meeting, 7 p.m.; Dinner, 7.30 p.m.

Royal Society of Arts, John Street, Adelphi. "Utilisation of Solar Energy," by A. S. E. Ackermann. 8 p.m.

Thursday, April 29th.—Institution of Electrical Engineers. "The Bombay Hydro-Electric Scheme," by A. Dickinson. 8 p.m.

Saturday, May 1st.—Royal Institution. Lecture I.: "Photo-Electricity," by Prof. J. A. Fleming, F.R.S.

THE ELECTRICAL EMERGENCY SERVICE

Volunteer Switchboard Attendants Wanted for Part Time Service

ELECTRICAL men who have any leisure time are urgently requested to send in their names to us and to signify their willingness to act as part-time switchboard attendants during the war. Every electrical man, no matter how high his standing in the profession, is begged to respond to this appeal if he has four hours' leisure a day, and if he is willing to be called on to meet the emergency.

There is already a great shortage of switchboard attendants at electricity works, tramway power houses and sub-stations. In some cases men unsuited to the work have had to be quickly taken on, and trained so far as possible, and in other cases the shifts have been lengthened to twelve hours, and the strain will soon tell.

Most electricity works have refused to let further switchboard attendants leave to join the Army, and the War Office has, in many districts, acceded to the request of the electricity works, and actually refuses to recruit any more of their employees. There are thus hundreds of men of military age and eager to serve, being kept back on this account.

The shortage will become more and more acute as the men gradually leave to take on better-paid work in the industrial army making war material, in response to the wide appeals now being circulated.

Temporary switchboard attendants are therefore wanted at once in many electricity works, owing to an actual shortage of men.

Further temporary switchboard attendants will be needed to replace men leaving to work in manufacturing industries supplying the War Office and Admiralty.

Still more temporary switchboard attendants will be required to enable young men working on the switchboards at present to join the army.

The organisation of the Electrical Emergency Service is for the purpose of supplying this need. We are preparing a register of electrical men who are willing to give a portion of their spare time to work as temporary switchboard attendants, and the arrangements as to hours of service will be very similar to those of Special Constables.

Large numbers of men connected with the electrical industry have joined the Colours; others are doing a national service in connection with the manufacture of war material or of apparatus required for its manufacture. There are, however, many electrical men, above the military age, or for some other reason unable to join the Colours, whose time is not fully occupied, and whose desire is to "do something" for the national cause, in which the technical knowledge they possess will be of utility.

The men who register in the Electrical Emergency Service, and whose offer for the above work is accepted, will be giving service of even more immediate need to the nation than the numerous Volunteer Training Corps, and quite equal to the self-sacrificing work performed by the Special Constables all over the country.

Mr. A. L. C. Fell, Chief Officer of the London County Council Tramways, has expressed his approval of the Electrical Emergency Service, and can already avail himself of the services of a number of members as soon as they are enrolled; we have also already had an application from another electricity works in London.

Applications for enrolment, on the form below, should be sent to the Editor of ELECTRICAL ENGINEERING, 203 Temple Chambers, London, E.C., who will be pleased to reply to any inquiries for further information, and from whom also further application forms may be obtained.

The Service Required.

- A. A full eight-hour shift a day, or—
- B. A half-shift (four hours) daily (1st week morning, 2nd week afternoon, 3rd week night, in rotation).
- C. A half-shift every day, without midnight work.
- D. A half-shift alternate nights with no day work.

To prevent any suggestion of competition with regular employees, wages will be paid in proportion to the existing rates at the works at which the member is employed, and to the time given.

A week's notice will be required from any member leaving the Service.

APPLICATION FORM.

(Please cut out, fill in, and return to the Editor of "Electrical Engineering," 203 Temple Chambers, London, E.C.)

I wish to be enrolled as Member of the Electrical Emergency Service.

Age..... Married or Unmarried.....

Qualifications (state electrical experience)

.....
.....
.....

I am willing to work a full shift as (A) (above),

a half shift as (B), (C), (D).

(Delete the line and letters not applicable.)

My regular occupation prevents me at present from giving electrical emergency service between.....a.m. and.....p.m.

distinctly, and give
addresses very fully.)

EXTENSIONS OF PLANT AT CARLISLE

THE latest addition to the generating plant at the electricity works of the City of Carlisle, which was formally inaugurated last week, marks the entry of turbine-driven three-phase plant into the system. These extensions form good examples of up-to-date central station equipment, and comprise one 1,250-kw. turbo-alternator complete with surface condenser and wet-air filter, two 600-kw. rotary converters, high- and low-tension switchboards, a new pipe-line and river sump for condensing water, a new water-tube boiler, and additions to the lighting battery. For the reception of this plant the station building has been prolonged so as to join up to the building used as offices by the Electricity Department, and space is available for the installation of two more sets of the same size.

The turbo-alternator was supplied by the British Branch of the Maschinenfabrik Oerlikon (Switzerland), and is of interest on account of its high speed and small size. It is of similar type to the machines which have already proved their economy in steam consumption in the Marylebone Electricity Works, and were described and illustrated in ELECTRICAL ENGINEERING, Vol. IX., p. 675, December 4th, 1913, and Vol. X., p. 646, December 24th, 1914, but is of smaller size. It is rated at a continuous output of 1,250 kw. at 3,000-3,300 volts 50 cycles when supplied with steam at 160 lb. per sq. in. at 100° F. superheat, and as the alternator is of the two-pole type, the set is enabled to run at 3,000 r.p.m. The turbine is of the pure impulse type as developed by the Oerlikon Co. The governing and main throttle valves are worked by oil pressure in a way described in the article referred to above, and an independent run-away trip is provided. Overloads are dealt with by admitting live steam with a bye-pass after the first two stages under control of the main governor. The alternator is also very compact. It is of the two-pole revolving field type, with slotted cylindrical core and distributed winding. It is of particularly substantial construction in view of the high speed. A small exciter is coupled to the machine by a flexible coupling. The alternator is enclosed and ventilated by fans of special design mounted on the rotor. The air is drawn through a wet-air filter described hereafter.

The condensing plant was supplied by the Worthington Pump Co., Ltd., and is designed to deal with 20,600 lb. of exhaust steam per hour, maintaining a vacuum of 28 in. with barometer at 30 in. and cooling water at 65° F. The condenser is of the rectangular two-flow type, having 2,300 sq. ft. of cooling surface, and as no main exhaust valve is provided it has flooding valves on the condenser. The air and hot-well pumps consist of a Worthington 5-in. rotary air pump on the ejector principle, carried upon an operating pump with an attached hot-well pump. The air pump is guaranteed to deal with 17½ lb. of air per hour, at a vacuum of 28 in. The hot-well pump will extract from condenser at the rate of 60 gals. per minute, and deliver against a head into feed-water tank. This machine is driven by one 12½-h.p. Oerlikon D.C. motor running at 560 r.p.m. It is provided with water sealing tank, water being circulated around, and the make-up supply being taken from the circulating suction. The centrifugal pump delivers at the rate of 1,450 g.p.m., and is a 10-in. machine running at 725 r.p.m., driven by a 20-h.p. motor. The condensing plant motors are supplied from the lighting bus-bars, but in the event of failure of supply they are automatically switched over to the batteries. To supply the necessary large quantity of water required for condensing purposes, a new pipe-line and sump have been put down to the river, the suction being 22 in. and the discharge 18 in. diameter respectively. These will supply the water requisite for the three turbine sets when all are installed.

The wet-air filter is of the revolving type, supplied by Heenan & Froude, Ltd. (Worcester). This apparatus does not depend on spraying of the water in any way, but is designed on the principle of utilising wet surfaces of large area close together. The wet surface is contained in a rotating drum of special design, consisting of a cast-iron centre on to which is wound spirally thin galvanised plates, a very small space being left between each layer for the air to pass through. These drums are mounted on a horizontal shaft and rotated slowly, with the lower part in a tank of water, and the air to be filtered passing through the upper part, baffles being fitted so that there can be no leakage of air past the drums. The wet plates comprising these drums take up the most minute particles of dust and foreign matter in suspension in the air, owing to the fact that the velocity of the air through the drums is over the

critical value where a stream-line motion is replaced by an eddying motion, the eddying motion being increased by the splitting up of the stream lines when the air enters the drums, so that every particle of air is thoroughly scrubbed against the wet surfaces, the latter being washed clean by the rotation of the drums in the water. At no part of the process is there created a violent disturbance of water such as might result in loose moisture being given off at the filter outlet.

In order to provide the connecting link between the A.C. and D.C. systems, two 600-kw. Westinghouse six-phase rotary converters running at 750 r.p.m. are installed with the necessary transformers. The converters are arranged for D.C. starting only, and are capable of supplying traction current at 500-550 volts, or lighting current at 460-550 volts, with the middle wire taken back to the transformer, so that an out-of-balance current up to 25 per cent. can be dealt with. They are also capable of running inverted off either supply, and so furnish the alternating supply at 3,000-3,300 volts. A special exciter is mounted on the shaft of each converter, so that when it is running inverted, any undue speeding-up, due to the demagnetising effect of the wattless current in the armature when an inductive load is suddenly thrown on, is prevented. The effect of the exciter is to increase automatically the current in the rotary field when the rotary begins to speed up, and in this manner balance the demagnetising effect of the armature. A further speed-limiting device is fitted in the form of a centrifugal arrangement operating a switch, which causes the no-volt tripping coil of the circuit-breaker to come into action at excessive speeds. In order that voltage regulation may be obtained, a synchronous booster has been provided with each machine.

The switchgear has also been supplied by the British Westinghouse Co. It is placed on an extension of the existing D.C. switchboard gallery, and is arranged so that the H.T. feeder cables are brought direct from the street and in to the cubicles without any intervening cable subway. The high-tension switchgear consists of an operating board, behind which is erected the moulded stone cubicles containing the bus-bars, oil switches, instrument transformers, and isolating links. The cubicles are arranged on the back-to-back system, with a passage-way round the whole structure. Panels are provided for two rotary converters, two turbine sets, two feeder panels, and spare panels for an additional rotary and turbine set. An automatic voltage regulator for the turbo-generator is carried on the same board. This is of a new pattern recently introduced by the British Westinghouse Co. under the Olmsted patents. In this apparatus a main control coil connected across the mains, directly or through a pressure transformer, raises or lowers a core connected to a lever controlled by a spring and a dash-pot. A vibrating lever is also provided, worked like the hammer of an electric bell by a coil taking current from a few accumulator cells. This carries a contact engaging periodically with contact on another spring-mounted lever, the limiting position of which is varied by the main control lever already mentioned. The arrangement is such that the movement of the main lever causes the intermittent contact between the vibrator and the other lever to vary in its duration. This variable contact controls a relay circuit, which actuates the main regulator contacts, which cut the control resistance in and out of its connection as a diverter to the main shunt regulating resistance. The above is an outline of the main principle, but there are naturally various refinements of detail, adjustments, &c. The D.C. board for controlling the rotary converters is situated on the same gallery, but at right angles to the H.T. board. The main machine switch is electrically interlocked with the change-over switch fixed on the rotary, to ensure that both switches are set for lighting or traction as required. The direct-current board is connected to the old board by bare copper strip, suitably mounted on insulators.

We wish to express our thanks to Mr. F. W. Purse, City Electrical Engineer, for his courtesy in supplying us with information regarding the new plant, and also to some of the contractors, notably the Oerlikon Co., Heenan & Froude, Ltd., and the British Westinghouse Co., to whom we are indebted for particulars relating to the portions of equipment supplied by them.

In connection with the Carlisle Electricity Undertaking, it is interesting to record that 30 per cent. of the staff are now serving with the colours, those still employed being furnished with a badge indicating that they are engaged on public service. Below are given the names of the men now with the Forces:—

H. P. Baynham, station superintendent (Royal Engineers);
J. H. Hay, chief clerk (4th East Lancs. Howitzer Brigade,

Cumberland R.F.A.); W. Fraser, storekeeper (7th Batt. Border Regiment); G. Stephens, assistant storekeeper (Border Depôt); H. S. Ballantyne, switchboard attendant (4th Batt. Border Regiment); W. V. Thompson, consumers assistant (Army Service Corps); F. Fairclough, meter reader (4th Batt. Border Regiment); J. Mannion, jointer (4th East Lancs. Howitzer Brigade, Cumberland R.F.A.); R. Baxter, stoker (2nd Batt. Border Regiment); M. Berry, coal trimmer (4th Batt. Border Regiment); R. H. Sanderson, engine-room attendant (4th East Lancs. Howitzer Brigade, Cumberland R.F.A.); A. Wright, coal trimmer (Royal Engineers); J. Simpson, apprentice (4th East Lancs. Howitzer Brigade, Cumberland R.F.A.); G. Todd, apprentice (4th East Lancs. Howitzer Brigade, Cumberland R.F.A.); R. Gem, apprentice (Royal Engineers); W. H. Clark, porter (4th Batt. Border Regiment).

ARTIFICIAL ILLUMINATION AND ARCHITECTURAL EFFECT

IN a Paper upon this subject before the Society of Architects, on Thursday, April 15th, Mr. S. D. Chalmers, head of the Department of Technical Optics, Northampton Institute, London, commented on the little progress made by the illuminating engineer in the application of new methods to purely architectural problems. Hitherto, the production of the illumination requisite for the comfortable use of a room for its ordinary purposes had been the aim, whilst economy had been a prime consideration. Just as natural lighting, however, had led to important architectural developments, so artificial lighting might be equally capable of a success of that character. The great controllability of artificial light was an asset, and he urged architects, at any rate on the more important buildings, to make greater efforts at weaving the lighting effects into the general architectural scheme. He did not altogether approve of indirect lighting except for special purposes, such as drawing offices, and for general purposes preferred the semi-indirect system. This method was specially useful when the ceiling and frieze of a room were worthy of attention in themselves. It was, however, preferable to show the sources of light illuminating the ceiling, even if the greater part of the light be derived from concealed sources. There was a number of cases in London where the ceilings had been lit entirely by concealed lights, and the effect had not been happy.

In the course of a short discussion, Mr. James Darch, an architect, expressed the opinion that architects are too much governed by the engineer in the matter of lighting. Illumination was an art and not a science, and the engineer almost invariably failed on questions of art. The work of the engineer was to produce the illuminant, leaving it to the architect to distribute. Mr. Percy Tubbs said architects would appreciate a table giving the value of various illuminants at different distances. The author pointed out that most lamp-makers supply such information. Messrs. L. Gaster and J. S. Dow urged greater co-operation between architects and illuminating engineers.

ELECTRIC POWER IN INDIA

APAPER on the development of electric power for industrial purposes in India, by Mr. H. R. Speyer, which was originally intended to have been read at a meeting of the Institution of Electrical Engineers, has, owing to the author remaining in India, been published in the *Journal of the Institution*.

Mr. Speyer points out that out of the ninety-five cotton mills and forty-five jute mills, aggregating some 200,000 h.p. at the two great industrial centres, less than 10 per cent. is yet driven electrically. That the large field for electrical driving has not been better covered, the author attributes to British manufacturers having been reluctant to consider seriously the systematic canvassing of the country, and to have been too prone to place the management of their Indian agencies in the hands of commercial men to the exclusion of engineers, with the result that machinery quite unsuited to the conditions prevalent in India has been sent out, causing mill-owners to regard electric driving with disfavour. That there has been a steady increase in electrical imports and decrease in steam imports is clear from curves given in the Paper. Unfortunately, however, of the 66,900-kw. of

plant installed in the five most important supply undertakings in India, Switzerland has supplied 54,000 kw., England only 7,500 kw., and the United States 5,400 kw. of the prime-movers, whilst Germany has supplied no less than 32,000 kw., the United States 17,000 kw., Switzerland 10,000 kw., and England only 7,500 kw. of the electrical generating plant. In the author's opinion, this is due chiefly to the greater standardisation covering a large range of voltages, in many cases from 220 to 6,000 volts, which allows foreign manufacturers many opportunities of putting forward standard plant where British manufacturers are obliged to quote higher prices to cover special construction and require longer times for delivery. The Continental makers, so he says, make a more complete study of the local conditions.

With regard to the climatic conditions in India, it must be remembered that during the "rainy" season, which lasts each year from June to October, the humidity reaches a figure of 95 per cent., with a temperature often of 98° F., and in the mills, factories, and engine-rooms a temperature of 115-120° F. is often recorded. The temperature of water available for condensing purposes during the hot months, even when taken direct from the river or other sources of supply, often reaches 95° F., with the result that in the case of turbine plant it is essential to install condensing plant of much larger capacity than at home. In view of these climatic conditions there has been some difference of opinion whether it was advisable to wind motors for so high a voltage as 6,000. The author takes the view that the insulation of the average low-tension motor to prevent internal short-circuiting between successive turns due to the difference of potential between them is insufficient to prevent the percolation of moisture from an external source, whereas the insulation necessary on 6,000-volt mains to prevent internal short-circuiting due to the potential difference between successive layers is more than sufficient to prevent the percolation of moisture from an outside source.

Another factor which has hampered the development of electricity for industrial purposes in India during recent years has been the lack of English capital for projected industrial enterprises for utilising either water power or coal near the pit's mouth for the generation of electric power for transmission at a cheap rate for mill and factory use. Several proposed schemes are mentioned which were not carried through for this reason. The Tata water-power scheme was carried out with capital raised entirely in India.

There are various local conditions which require plant which would be successful at home to be unsuitable in India. For example, a point often lost sight of is the fact that during the rainy season the average textile mill, after having been shut down on the Saturday afternoon, requires approximately double the amount of power to get under way on the following Monday morning, owing to the abnormal humidity causing the rope drives to tighten during the interval. It is therefore advisable when designing an electric drive with either ropes or belts to allow for the starting gear having an overload capacity of 80 to 100 per cent. The author discusses to some extent the relative advantages of public supply and private plant, holding that where facilities for coal and water supply are adequate, load above 15,000 h.p. can be dealt with as cheaply by private as by public supply. The power load is a great advantage to public supply companies, and the author recommends a system of charging based on a standing charge per h.p. installed, with the addition of a fixed rate for energy used.

A few details are given of the most important power schemes in India. The largest is that of the Tata Hydro-Electric Power Supply Co., whose power-house under construction at Khopoli (Bombay Presidency) will supply 30,000 h.p., and later 60,000 h.p., to the Bombay cotton mills. Water is obtained from the Bhor Mountains through a series of storage reservoirs at a head of 1,700 ft., and Pelton wheels driving 8,000-kw. units will be used. The main transmission will be at 100,000 volts over forty-three miles. The Cauvery power scheme in Mysore has now a station capacity of 16,750 h.p., and transmits power ninety-two miles at 35,000 volts to the Kolar gold-fields. A further 5,000 h.p. is about to be installed. The Calcutta Electric Supply undertaking (see ELECTRICAL ENGINEERING, Vol. IX., p. 661, November 27th, 1913) has a capacity of 15,000 h.p., and the Bombay Tramways & Electric Supply Co. have a station of 12,000 h.p. The largest private generating station is that of the Tata Iron & Steel Works at Sakihi, Bengal. There are a number of electrically-worked tramways in India, but at present no railway has adopted electric traction. Several schemes are, however, being considered by the Indian State-owned railways.

THE ELECTRICAL TRADES BENEVOLENT INSTITUTION

THE annual meeting of this Institution was held at the Institution of Electrical Engineers on Monday. Mr. E. Garcke, who presided, moved the adoption of the report and accounts. He said that the total income for the past year amounted to £3,470, compared with £1,362. The income is the largest which the Institution has received in any year since its formation. Twenty-eight grants were made during the year, £252 being paid away, compared with fourteen grants costing £153 in the preceding year. The management expenses were £343 against £247, so that the total outgoings for the year amounted to £595, compared with £400 for the preceding year. The surplus is £2,874, compared with a surplus of £962 for the year 1913, and the total capital of the Institution at the 31st December last was £7,870, as against only £4,996 at the 31st December, 1913. Notwithstanding this comparatively satisfactory result, the funds of the Institution, said Mr. Garcke, were really making very slow progress considering the size of the electrical industry. At present it was quite impossible to relieve even a small part of the distress which exists. It was suggested that all electrical firms should become annual subscribers, and that everyone engaged in the industry should become a member of the Institution. If the 5,000 or 6,000 firms in the industry subscribed five guineas, or even one guinea, they would have a substantial income, or, better still, if everyone in the industry became a member and paid 10s. or 5s. per annum, the Institution would be in a position to give relief to everyone in distress, and to promise a moderate pension to everyone in need of it. Another means might be to ask shareholders in electrical companies—to whom many millions sterling were paid annually in dividends—to agree to a deduction of one penny in the pound as a contribution to the Benevolent Fund. The Chairman concluded by paying a tribute to the work of the Secretary, Mr. F. B. O. Hawes, and to the successful efforts of Mr. H. Hirst and Mr. G. Sutton to raise funds at the recent Festival dinners.

Mr. Justus Eck, in seconding the adoption of the report and accounts, said that three-quarters of those who had been compelled to seek relief from the Fund had been put into permanent employment.

The report and accounts were then adopted.

The following members of the committee retired by rotation, but were re-elected:—E. J. Clark, Guy Burney, H. Bevis, H. H. Berry, Lt.-Col. H. M. Leaf, Lord Vaux of Harrowden, F. J. Walker, R. J. Wallis-Jones, S. D. White.

Mr. H. Bevis, speaking with regard to the slow progress which the Fund was making, pointed out that the amount in hand was more than that of the Institution of Electrical Engineers Benevolent Fund. At the same time, he was far from satisfied, although the present was a most unfortunate period to have to ask for subscriptions.

Mr. Eck said the present intention was to hold a Festival Dinner this year.

A vote of thanks to the Chairman closed the proceedings.

POWER CHARGES AT BEDFORD

IT is not often that the mayor of a town puts himself in strong opposition to the proposals of the electricity committee of his own council, but this happened at the Town Council meeting at Bedford last week in connection with a report as to the price to be charged for power supply. The Council recommended the adoption of proposals by Mr. R. W. L. Phillips, the Borough Electrical Engineer, involving a change in the system of charging. It appears that the agreement with Messrs. W. H. Allen Son & Co. for the supply of power to their works had expired, and the proposal before the Council was that the occasion should be taken to revise the tariff for electrical energy. The change recommended was 1d. per unit be charged up to 300,000 units per annum, with discounts varying from 2 per cent. for a load factor of 12 per cent. up to 20 per cent. for a load factor of 20 per cent. Messrs. Allen would then be entitled to the maximum discount, making the charge to them 0'8d. per unit. Mr. Phillips explained the reasons why power was much cheaper to supply than lighting, and as regards Messrs. Allen's contract, estimated the proportion of fixed costs at the works at £194 per annum, and the works' running cost of supplying 613,250 units at £1,276, making a total of £1,470. The revenue at 0'8d. per unit would be £2,040, leaving £570 gross profit, out of which the capital charges amounting to £260 per annum allocated to their service were to be met.

In the course of his report Mr. Phillips gave some interesting figures relating to the effect of metal filament lamps on the lighting load since 1908. In 1909 the lighting revenue was £879 lower than the previous year; in 1910 there was a

further drop of £304; and in 1911 the lighting revenue was again £188 lower than the previous year. After this it increased again, but had not caught up to the 1908 value until 1913. Without a power load, therefore, there would have been serious deficits.

The Mayor's chief contention was that there would be a loss on the power supply at the price mentioned, and that the profit now made by the electricity works was partly illusory, as the Borough was charged 3'52d. per unit for public lighting. He proposed as an amendment that the price for power be 1d. per unit for all consumers less a 5 per cent. discount. One penny per unit had been the price paid by Messrs. Allen previously, under an agreement made in 1905, and with coal and labour dearer he did not see why this price should not now be charged.

In the course of a long discussion, fully reported in the *Bedford Times and Independent*, it was mentioned that the reason of the high price for street lighting (which the Electrical Engineer had already stated several times in Committee should now be reduced) was that in the early days, when it was laid down, duplicate high- and low-tension cables were run over the whole town, and sufficient copper lay in the streets of Bedford to fill the German Emperor with envy. It was also pointed out, in reply to the Mayor's argument as to the increased cost of coal and labour, that the cost of generation was now less than formerly owing to the use of more modern plant. The question was raised of following the example of other towns of having a coal clause making an increase of 0'1d. per unit for every 6d. increase in the price of fuel, but the Town Clerk expressed the opinion that this was not admissible unless it was in the tariff for every consumer.

The amendment was ultimately lost by eight votes to ten; a further amendment that an outside expert should be called in was also defeated, and the report was then adopted.

REVIEWS OF BOOKS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

Electric Wiremen's Work. By J. H. Havelock. 332 pp. 7*1*/₂ in. by 5 in. 100 figures. (London: Crosby Lockwood & Son.) 5s. net; abroad, 5s. 6d.

The author of this book is the head of the electrical engineering department of a technical institute, and, it must therefore be presumed, possesses both knowledge and experience in teaching. Yet we are not satisfied that the somewhat unconventional methods employed in the volume before us to teach electrical wiremen their work are the most suitable ones. Before the second page is passed, the electric wireman will find himself floundering in a quagmire of C.G.S. units—dynes, ergs, and joules; on pp. 8 and 9 he is introduced to inductance, impedance, and electric resonance, with the relevant algebraical formulæ; and within the next dozen pages he has specific resistances in microhms and temperature coefficients; on p. 183 he is told that it is futile to attempt to solder with an improperly tinned iron, and that it is sheer waste of time to keep pouring molten metal on a dirty joint, and seeing it run off like water from a duck's back; and finally, on p. 185, he is given a collection of carefully labelled pictures, which include a hacksaw, two screwdrivers, a pair of scissors, and a rubber glove. The appendices will enable the electric wireman to ascertain, incidentally, the modulus of elasticity of aluminium, the specific resistances at 0° C. and the temperature coefficients of platinum, tantalum, and distilled water, and, "by kind permission," the Wiring Rules of the Institution of Electrical Engineers, and four-figure logarithms, anti-logarithms, chords, sines, tangents, cotangents, and cosines. But perhaps the title is apt after all. To appreciate the book will be work, and very difficult work indeed, for electric wiremen.

Company Law and Practice. By H. W. Jordan. 454 pp. 8*1*/₂ in. by 6*1*/₂ in. (London: Jordan & Sons, Ltd.) 12th Edition. 3s. 6d. net; by post, 3s. 1d.; abroad, 4s. 3d.

The author has arranged, in a convenient form for reference, the requirements of the Companies Acts and other Statutes affecting companies, so that the work forms a compendium of company practice covering a wide range. The present edition has been revised so as to include the requirements of the "Trading with the Enemy" legislation and the restriction of the Treasury on the issue of new capital.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

QUESTION No. 1,439.

What special precautions are needed in the design of porcelain bobbins for winding resistance wire for heating purposes and winding the wire thereon, and what current density can safely be used?

(Answers must be received not later than first post Thursday, April 29th.)

ANSWERS TO No. 1,437.

Acceptance tests of generators at works are often made by taking only copper and iron losses. Are these a reliable criterion of the operation of the machines at full load, particularly with regard to sparking?—"T. G."

The first award (10s.) is made to "AGATE" for the following reply:—

The question is not very clear, but "T. G." apparently refers to the case of large generators which cannot be put on full load at the works on account of lack of sufficient power supply, or through not having a prime-mover of sufficient capacity. In such cases it is usual to carry out what is known as the "short-circuit" test, and also to measure the power taken by the machine when running light as a motor.

The "short-circuit" test is as follows:—The connections of the series winding (if any) are reversed, so that the magnetic effect of the series winding will oppose that of the shunt winding. This is done so as to get as nearly full excitation as possible on the shunt coils, and hence to get a fair indication of their temperature rise. The brushes are next short-circuited through an ammeter range and the machine started up by some form of drive. The shunt excitation is regulated to give full-load current through the armature when the machine is running at correct speed. This test gives an indication of the temperature rise of the machine in all its parts. Also, since the sparking properties of a machine depend upon the reactance voltage, which is proportional to the current in the armature, the sparking during the short-circuit test is a fairly reliable indication of the sparking under working conditions, although during this test the machine is giving full-load current with perhaps not more than 4 or 5 volts across the brushes.

The power taken by the machine when running light as a motor gives directly the iron, windage, and friction losses. If these losses are required to be known for various voltages they may be found by measuring the power taken by the machine when running light as a motor at different voltages, the shunt field being adjusted to give constant speed.

We have, therefore, a reliable indication of what the sparking and temperature rises will be at full load from the "short-circuit" test, while the losses due to iron-hysteresis, &c., and to friction and windage are found direct from the "light" run as a motor. The copper losses can be calculated from resistance measurements and the full-load current. Thus we have the total losses in the machine at full load from which the efficiency can be calculated. It should, perhaps, be noted, however, that the iron loss at full load will be slightly greater than at no load (as found by "light" run), owing to the distorting effect of the field due to the armature current on the main field. This causes a greater flux density in the teeth and in the edges of the pole-shoes, thus causing a slightly greater iron loss.

The second award (5s.) is given to "A. R. T. C." who writes as follows:—

Acceptance tests of machines, so far as efficiency is concerned, are usually carried out by measurement of the losses, for the simple reason that much greater accuracy is possible than with the input-output method, and also the tests are easily and cheaply carried out, which in the case of large machines is an important consideration. Considering a D.C. generator, the following tests are required for determining the efficiency:—(1) Resistance measurement; (2) iron loss; (3) friction and windage. The methods by which these losses are obtained are well known and need not be described. The efficiency at any output is then equal to the ratio of the output to the sum of the output and the losses at that output. The efficiency obtained is somewhat lower than the true efficiency, as in actual service there are small additional losses, such as circulating currents in the armature coils and brushes, and eddy currents in the iron of the armature. It is impossible to make any definite allowance for these, since they may vary, due to one cause or another, as, for instance, a slight change in brush position. However, these additional losses will certainly not affect the full-load efficiency by more than 0·5 per cent. Regarding commutation, it is usual to carry out a temperature run with full field and no current in the armature, and also with the armature short-circuited through an ammeter and a small field sufficient to cause full-load current to flow through the armature. The temperature rises after six hours' run are measured, and a fair idea obtained of the performance of the machine under normal working conditions. The short-circuited test is not usually carried out on non-interpole machines, as they cannot commute full-load current satisfactorily. With interpole machines, however, the commutation observed gives a good idea of what may be expected in service, but this test should not be taken as superseding a full-load test.

QUESTION No. 1,436.

The author of this question writes us as follows:—How to discover whether a winding is star or delta connected is by no means so simple as "M. M." seems to think. The solution which "M. M." gives is surely in error, for application of the method he proposes to the simple case of a two-pole ring winding, each phase covering two-thirds of a pole pitch, shows that polarity will be produced as well by the star as by the delta winding. It seems to me probable that "M. M." in thinking the matter out, has confused the beginnings and the ends of the phases. I know of only one method which is quite general, and it is practically a very imperfect one, tedious and difficult to apply. It is this: Surround the armature circumferentially with one or more turns of cable and pass through these turns alternating current. If the armature is delta connected an alternating current will be induced in it by transformer action, the applied turns forming the primary and the whole armature forming a single-turn secondary. Unfortunately, the transformer so formed is somewhat "loosely coupled" and the induced current difficult to detect. Theoretically it should be possible to detect it by the heat produced. Such a current would not, ordinarily, produce any difference of potential at the slip rings or terminals of the three-phase winding. Should the winding be star connected there will, of course, be no circulating current produced. Though the general solution of the problem is difficult, each case that occurs in practice can usually be solved either by inspection of the winding or by some simple method applicable to the particular type of winding.

Institution of Electrical Engineers.—The following is the result of the ballot for new members at the meeting on Thursday:—
Members.—J. Cook, Lt.-Col. E. H. Leaf, R.E. (T.), E. W. Monkhouse. **Associate Members.**—W. Dundas, C. V. Peake, A. L. Tackley. **Graduates.**—R. G. Campbell, A. F. Carter, F. W. Highfield, H. R. Lamb, B. McCormick, R. E. Owen, G. A. Sloan, A. Winks. **As Students.**—H. J. Boyland, E. D. Chapman, C. V. Clarke, K. Davidson, A. T. de Paiva, C. Derry, E. L. Glew, H. J. Greenwood, H. J. Hall, L. W. Hayes, F. E. Hunt, E. Lerpiniere, W. F. Lloyd, P. D. Morgan, C. V. Narasingarao, B. H. O'Brien, A. C. Pallot, D. E. Pledge, D. A. Rankin, D. Ripley, V. Ross, E. S. Russell, R. L. Smith-Rose, J. B. Snell, H. T. Stafford-Ball, F. L. Standage, H. A. Whistler.

CANDIDATES TRANSFERRED.—**Associate Member to Member.**—H. Aldum, P. A. Paris, J. W. Spark, T. Wadsworth. **Graduate to Associate Member.**—E. J. Bennett, H. J. Loughlin, C. H. Woodward. **Student to Associate Member.**—H. Clausen, F. F. Elliott, W. B. Garrett, E. Hughes, N. J. Perryman, L. Roberts, G. O. Scampton. **Student to Graduate.**—V. A. Bright, F. J. Delves, C. F. Goodale, S. Willis.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 15th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

29,622/13. Resistances. J. COLLINSON. Grid resistances in which the grids are made of sheet metal which has been passed through a press or rolls such as are used for the manufacture of "expanded" metal, but which has not been expanded. (Three figures.)

4,017/14. Heaters. J. R. QUAIN. The heating element consists of a flat casing of silica containing a metal filament wound zig-zag round a series of pegs formed in the silica base of the casing, and lying in grooves therein. The flat top is fused on hermetically, and the case is exhausted or filled with an inert gas. (Two figures.)

8,134/14. Loading Telephone Lines. H. B. M. PLEIJEL and A. H. OLSSON. Method of arranging "Pupin" coils on duplexed double telephone lines with the coils in the current lines so constructed that the current of the duplex connections produces in them stray fields which serve to load the main line as branches of the duplex lines, whereby, with the same set of coils, the double lines are loaded as main lines and as a branch of the duplex lines. (Three figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

DYNAMOS, MOTORS AND TRANSFORMERS: B.T.-H. CO., CLOUGH and WHITCHER [Protection of alternators] 8,173/14.

Heating and Cooking: QUAIN [Heaters] 4,941/14; WEAVING, SMITH and FERRANTI, LTD. [Heaters] 17,945/14.

Incandescent Lamps: LANGMUIR [Incandescent lamps] 17,326/14.

Switchgear, Fuses and Fittings: ELLISON and MUELLER [Protective devices for motors] 624/14; CAMILLERAAPP [Shock-absorbing lamp holders] 7,644/14; WELLS [Electromagnetic control apparatus] 10,823/14; W. BUTCHER & SONS, LTD., GILL and LIPPOLD [Switches for cinematograph lamps] 17,596/14; SUMNER [Current graduating devices] 18,106/14.

Telephony and Telegraphy: BLONDEL [Location of radio-telegraphic stations] 28,183/13; MARKS [International Quadruplex Co.] [Diplex and quadruplex telegraphy] 2,100/14; BELIN [Time signals] 6,389/14; WESTERN ELECTRIC CO. (Woodward for W. E. Co., U.S.A.) [Automatic Telephones] 13,524/14.

Traction: MOORE and BERRY [Signalling and train-stops] 2,550/14; MIDGLEY and VANDERVELL [Car lighting and engine-starting dynamos] 6,430/14; SAYERS, ACFIELD, SALT and COOKE [Electrically controlled block system] 9,134/14.

Miscellaneous: B.T.-H. CO. and JEWITT [Regulating devices] 8,717/14; HEYES and HEYES [Signalling] 12,721/14; MILLER [Alarm apparatus] 24,780/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

DYNAMOS, MOTORS, &c.: BRITISH WESTINGHOUSE ELECT. & MFG. CO. [DYNAMOS] 4,560/15.

Ignition: R. BOSCH [Connections] 10,478/15.

Telephony and Telegraphy: ELEKTROTECHNISCHE SPEZIAL KONSTRUKTIONEN G.m.b.H. [Thermic telephones] 4,353/15; SMITH [Telephone systems] 4,582/15.

Miscellaneous: MARELLI [Electric machines] 20,784/14.

The following Amended Specifications can now be obtained:—

DYNAMOS, MOTORS, &c.: B.T.-H. CO. and R. S. GIVEN [Motor control] 14,524/13.

Telephony: W.AITKEN [Semi-automatic system] 19,443/13.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

8,478/01. Arc Lamps. A. ECKSTEIN and A. E. ANGOLD. A differential solenoid-controlled cut-out for inserting arc lamp substitutional resistances.

8,648/01. Telephony. W. L. WISE (American Machine Telephone Co., U.S.A.). A complete automatic telephone exchange system.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: P. MÜLLER [Projection arc lamps] 27,251/05.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: W. HEPWORTH COLLINS [Conduits] 28,852/04.

DYNAMOS, MOTORS and TRANSFORMERS: ELECTROMOTORS, LTD., and E. GREENHALGH [Laminated pole pieces] 28,524/08; H. A. MAVOR, H. M. HOBART, and MAVOR & COULSON, LTD. [Multi-speed induction motors with pole-changing device] 30,556/09.

Instruments and Meters: H. H. LAKE (V. Arcioni) [Thermal ammeter] 29,363/04.

Switchgear, Fuses and Fittings: J. GUNNING [Time switches] 29,281/04.

Traction: W. R. SYKES [Signal indicators] 28,829/04; E. M. FITZ [Train-lighting dynamos] 30,333/09.

NEW PUBLICATIONS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

Directory of Paper Makers of the United Kingdom for 1915. 236 pp. 10 $\frac{1}{2}$ in. by 7 $\frac{1}{4}$ in. (London: Marchant, Singer & Co.) 1s.; by post, 1s. 4d.; abroad, 1s. 8d.

Submarine Vessels, including Mines, Torpedoes, Guns, Steering, Propelling, and Navigating Apparatus. By W. E. DOMMETT. 106 pp. 7 $\frac{1}{2}$ in. by 4 $\frac{1}{4}$ in. 21 figures and 16 plates. (London: Whittaker & Co.) 1s. net; by post, 1s. 2d.

The War and the Parting of the Ways.—This is the title of a little work, in which Mr. C. H. Luke has brought together some thoughts on the future of the British Empire in relation to the war. He has very little good to say of his country in its present state, and urges that to obtain the utmost possible prosperity after the war considerable reorganisation, industrial, military, and political, is essential. His remarks on the industrial situation are suggestive and interesting, and he points out the great need for a more efficient consular service, further extension of the activities of the Board of Trade, and in general more Government encouragement of industry. He has some hard words to say against British banking methods, and puts in a plea for the establishment of a Bank of Commerce under Government control. Labour, too, he would like to see controlled by a separate Ministry. In military matters he is wholeheartedly in favour of Universal Service, and in politics he bewails the acrimony of party strife. The work, with its pessimistic view of the past and present, would be depressing were it not for the author's buoyant hope in the possibility of the Empire's reform according to his own ideas.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

Mr. Charles Bright, F.R.S.E., in an article in the *Nineteenth Century*, deals with various aspects of telegraphy in war-time. He points out the far-reaching effect of the telegraphic isolation of Germany through the cutting of the Channel cables at the beginning of the war, and gives very interesting accounts of the German attack on Fanning Island, where the Pacific cable was cut, and the raid of the *Emden* on Keeling Cocos Island, which, although successful in causing a temporary isolation, led to her own undoing. He discussed the effect on telegraph traffic of the banning of code messages of the Censor, and regrets the lack of central control of cable-working. In the latter part of the article Mr. Bright reiterates his arguments in favour of a State-owned British Atlantic cable, and expresses his regret that the present Atlantic cable system should be under American control. All these arguments have additional force now that we are in a state of war. He also throws some interesting sidelights on wireless in war-time, dwelling on its advantages in effecting communication at sea, and its disadvantages in the possibilities of receiving false messages and the use of hidden transmitting stations by enemy spies. He attributes Admiral Cradock's reverse to "jamming" of his orders to

his ships by the enemy, and finally brands wireless telegraphy as a "very two-edged" weapon, which does not at present serve as a suitable substitute for cable telegraphy wherever the latter is available.

ELECTRIC TRACTION NOTES

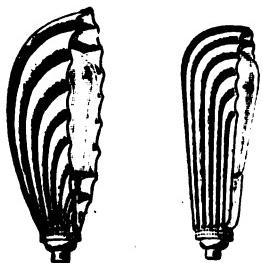

According to the *Electric Railway Journal* (New York), the shortage of horses and carmen in Vienna due to the war has introduced difficulties in the delivery of coal and other goods which are being met by employing the electric trams to tow trains of vans in the streets. Owing to the slow speed necessary these trains cannot be run during the ordinary service, and are only worked at night. The cars used for this purpose are provided with extra heavy resistances, and haul loads up to nine tons of coal at a speed of about 3·7 miles per hour.

A "late" Bill has been deposited in Parliament, called the "Railway Companies Facilities" Bill, the object of which is to authorise the City & South London, Central London, London Electric, and Metropolitan District Railway Companies to enter into agreements as to interchange of traffic, the formation of a common fund for making good deficiencies in the revenue of any of the companies, and the appointment of a joint committee to deal with any agreements which may be made.

"ELECTRICAL ENGINEERING" TRADE SECTION

SHOP WINDOW LIGHTING

A COMPLETE new series of seven styles of shop-window reflectors, all re-designed on scientific lines, has just been brought out by the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), consisting of the patterns illustrated here. All of these (except the hemispherical) are made in two sizes, the smaller designed for Osram lamps up to the 30 watts, and the larger for lamps up to the 60 watts, thus ensuring any pear-shaped Osram lamp of the usual sizes having its correct reflector. These reflectors are much more efficient than their less carefully designed predecessors, and in addition to having scientific contours, they effectively screen the light from the eyes of persons looking in the

Shell.

Vertical Parabolic.

Conic.

VARIOUS PATTERNS OF REFLECTORS FOR SHOP WINDOW LIGHTING.

shop-window, so desirable at all times, and necessary at the present time to comply with the police regulations. Special care has been taken to see that the shade-carrier ring, which holds the reflector in position, is easily accessible. Another important feature in the case of the deep conic and vertical parabolic patterns is the provision for the necessary ventilation. The finish is of high-class nickel plating, which assures the maximum amount of reflection being obtained, and owing to the correct form of the surface the light is projected in a manner which turns every ray to advantage. A neat folder, giving particulars and illustrations of these reflectors in tabulated form, together with a table of Osram lamp prices, will be sent on application by the Company's Illuminating Engineering Department, which may be freely consulted on all shop illumination matters.

generating set for supplying current for electric welding work, consisting of a four-cylinder vertical paraffin engine directly coupled to one of their "Castle" continuous-current dynamos specially wound for the work, on one bed-plate, with the necessary tanks, water-cooler, switchgear, and instruments. Particulars are given in a leaflet just issued.

METERS.—A collection of leaflets from Ferranti, Ltd. (Central House, Kingsway, W.C.), contain particulars of a number of patterns of Ferranti continuous-current ampere-hour meters for house service. These are of the mercury meter type with combined permanent driving and braking magnets, and are made in the two-wire ordinary and prepayment patterns, as well as in the form of two-rate meters and three-wire meters. A full series of spare parts is listed. Another leaflet describes the Ferranti continuous-current watt-hour meter for house service, also of the mercury type, but with shunt-wound driving magnet and permanent braking magnets.

FANS AND AIRCRAFT

A NEW folding leaflet from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), gives the excellent piece of advice: Keep cool in case of a heat-wave; and supplies particulars of their "Freezer" fans enabling this to be done.

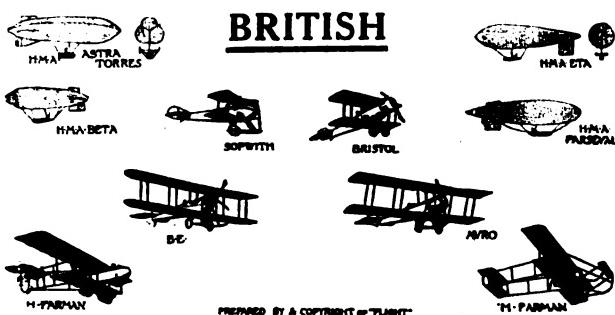

GERMAN & BRITISH AIRCRAFT

How to distinguish between the two.

The Zeppelin and Schütte-Lanz airships are very long; it should be noted that the former has three cars, the one in the centre being in the keel, while the Schütte-Lanz has five cars, two in the centre being arranged side by side. The M type has not only a distinctive shape, but the cars are joined to the gasbag by fabric.

The Taube is recognised by its bird shaped wings. Several of the biplanes cannot easily be distinguished from British or French machines. Some however, have the wings sloped back. The German aeroplanes have an "Iron Cross" painted below the wings and each side of the rudder.

PREPARED BY A COMMITTEE OF FLIGHT.

The Astra-Torres can be recognised by the trefoil shape when she is seen end on. The Beta has a peculiar car which tapers towards the rear, while the car of the Beta is more torpedo shaped. The Parasol is similar to the German Parcav. British aeroplanes fly the white ensign attached to their rudders.

The B.E. can be distinguished by the large curve at the rear edge at the ends of the planes. The British and Sopwith scouts are small. The Farnham have the propeller at the rear edge of the front planes. The British machines have a Union Jack painted below the planes while the French ones have a rosette of red, white and blue.

Folder No. 7, 1915.
Price, 1/-

On the other side is the equally good advice, "Keep cool in case of an air raid, and the information reproduced here on German and British aircraft is given inside. Copies of the leaflet can be overprinted with contractors' names and addresses.

INDIRECT LIGHTING AT SELFRIDGE'S

THE new annexe of Selfridge's, consisting of the provision department, is lighted entirely with half-watt lamps, and

FIG. 1.—SELFRIDGE & CO., LTD., OXFORD STREET, W. ARTIFICIAL LIGHT PHOTOGRAPH OF CORNER OF PROVISION DEPT., GROUND FLOOR, B.T.-H. "EYE-REST" SYSTEM OF INDIRECT LIGHTING WITH HALF-WATT LAMPS.

after a considerable amount of experiment with different methods of employing these lamps it was decided that the British Thomson-Houston Co.'s well-known "Eye-rest" system of indirect lighting met the case best from all points of view. On account of their brilliancy, half-watt lamps are particularly suitable to this form of lighting. This system was accordingly installed on the ground floor and first floor of this large block of buildings. The fine effect is shown in Figs. 1 and 2, and one of the fittings used is illustrated in Fig. 3. Each bowl is, of course, fitted with a special "X-ray" reflector in the correct focal position with the half-watt

FIG. 2.—SELFRIDGE & CO., LTD., OXFORD STREET, W. ARTIFICIAL LIGHT PHOTOGRAPH OF CORNER OF GROCERY DEPT., FIRST FLOOR. B.T.-H. "EYE-REST" SYSTEM OF INDIRECT LIGHTING WITH HALF-WATT LAMPS.

filament, which redirects the light on to the ceiling, whence it is distributed over the shop. In the basement semi-indirect lighting, also with half-watt lamps, is employed, and the B.T.-H. Co.'s "Lumina" fitting is used. One of these fittings is illustrated in Fig. 4. This lighting scheme is one of the finest examples of well-arranged shop lighting that can be seen, and shows that, when properly applied, half-watt lighting can excel as much in beauty as it can in economy.

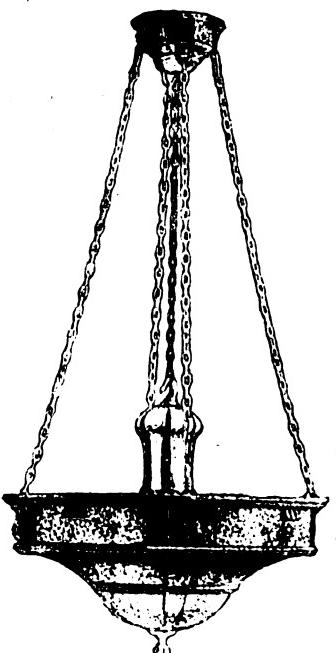

FIG. 3.—B.T.H. "EYE-REST" FITTING AS USED IN PROVISION DEPT.

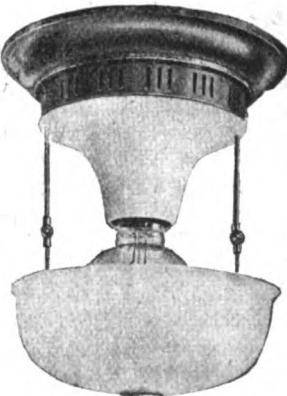

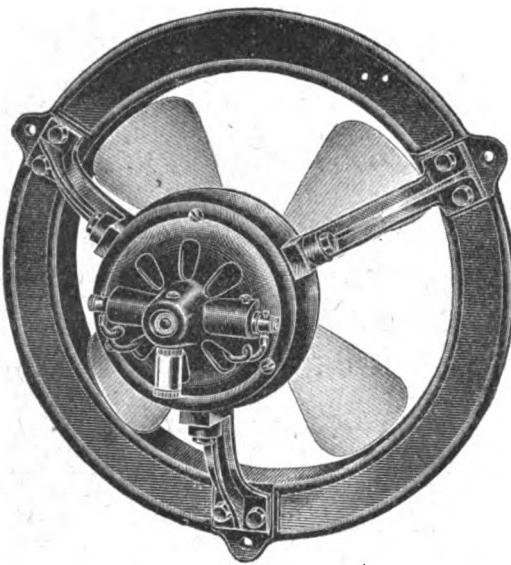

FIG. 4.—B.T.H. "LUMINA" FITTING AS USED IN MARBLE MARKET.

The whole installation reflects great credit upon all concerned, including Mr. H. J. Clarke, who is in charge of Selfridge's Building Department; Messrs. Rashleigh, Phipps & Co., the contractors; and the Illuminating Engineering Department of the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.).

Working 24 hours a day.

SUN VENTILATING FANS are made in a number of sizes, moving up to 20,000 cubic feet of air a minute.

In order to ensure a good and clear atmosphere in factories working two and three shifts a day, adequate ventilation is essential. Otherwise the workers are bound to be slack, and unable to put forward their best efforts.

There are many such factories in your district. Why not sell them

A NEW HEATING AND VENTILATING SYSTEM

A SYSTEM of combined heating and ventilating has been introduced by Credenda Conduits, Ltd. (Chester Street, Aston, Birmingham), and the first installation to be made in London of the apparatus is at work at the show-rooms of Baxter & Caunter, Ltd. (219 Tottenham Court Road). A combined heater and fan is situated in the basement. Air is drawn in by an electrically-driven centrifugal fan in quantity sufficient to change the 16,000 cu. ft. of air in the show-room, staircase, and corridors twice per hour through a drum-shaped heater, 24 in. long by 16½ in. diameter, attached to the body of the fan containing heating elements, consisting of resistance wire, heated to a dull glow, wound on porcelain bobbins. The heated air is passed up a well-lagged trunk with branches to outlets in the floor of the show-room. Three switches are provided, by which five degrees of heat can be obtained, with a maximum consumption of 10 kw. and a minimum of 2 kw. The case is in many ways an unfavourable one for this form of heating. Not only does much of the heated air escape up the stairs, but the frequent opening of the front and other doors causes a considerable cooling effect. It is surprising, however, in face of these disadvantages, how quickly the show-room heats up and how little energy is required to keep a comfortable temperature, owing to the excellent circulation of air which characterises the system. In a careful test under ordinary working conditions, with the outside air at 48° F., the full temperature of 58·7° F. was attained in less than an hour and ten minutes with the full consumption of 10 kw., and to keep up that temperature only 4 kw. was required, considerably less than would have had to be expended in ordinary radiators. In slightly warmer weather 2 kw. is amply sufficient. The apparatus has displaced two large fires and a 1-kw. radiator, but gives a higher average and much more even temperature. The system is here seen in its simplest form. It can, of course, be combined with any form of air-filter, and, if desired, automatic thermostatic control can be employed to keep the temperature constant instead of switching off the larger heating elements by hand when the required heat is obtained. Again, there is no reason why the heater and the fan should be in the same place. In large installations it will often be more convenient to have a single fan in the basement supplying one or more rising main trunks, and to put separate heaters in the branches on each floor, so that the heating of the various parts of the building can be adjusted separately.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Bolton.—An inquiry is to be held concerning a loan of £45,000 for electrical extensions.

Carnarvon.—A loan of £500 for mains is to be applied for.

Clacton.—A loan of £1,300 for a battery at the power station has been applied for.

Cuba.—An issue of the *Gaceta Oficial* (Havana), on file at 73 Basinghall Street, E.C., contains particulars of certain electric lighting concessions in Cuba.

Kingstown.—Mr. J. P. Tierney has been appointed Consulting Engineer for the Council's electric lighting scheme.

New Zealand.—The date for receiving tenders for a three-unit exciter set and a 1,500-kw. generator for the Lake Coleridge power scheme has been extended to May 21st. Firms with agents in Australia or New Zealand have only time to cable instructions.

Stretford.—Mains extensions at an estimated cost of £935 are to be carried out.

Waterford.—A L.G.B. inquiry is to be held into the Council's £30,000 electric supply scheme.

West Hartlepool.—Application is to be made for sanction to a loan for mains and services and for water-softening apparatus.

Wiring

Newport (Mon.).—Rearrangement of electrical installation, St. Mark's Church. Borough Electrical Engineer.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Dundee.—New City Hall.

Kilmarnock.—Lighting of workhouse. Clerk.

Middlesbrough.—School, Grove Hill.

Plymouth.—Extensions to technical school buildings (£17,000).

Wigan.—Cinematograph theatre. Eagle Picturedrome Co.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Wolverhampton.—The tender of Messrs. Mossay & Co. has been accepted at £630 for a 2½-ton Orwell electric vehicle for the removal of ashes from the generating station. The cost is to be met out of reserve.

Mr. J. H. Tucker & Co. have recently received contracts for annual supplies of service fuse-boxes from the Bolton and Blackburn Corporations and the Ilford District Council; for lamp-holders from the Swindon Corporation; for ironclad switches from the Dundalk District Council; and lamp-holders, switches, &c., from the Halifax Tramways Department.

Messrs. Venner & Co. have received contracts for twelve months' supply of Chamberlain & Hookham meters for Kirkcaldy, West Hartlepool, Swindon, and Pontypridd.

Contracts have been placed by the Swindon and West Hartlepool Corporations with the Bastian Meter Co. for 3- to 10-ampere meters and 2½- to 5-ampere meters respectively.

The British Westinghouse Co. have recently been favoured with contracts from the following supply authorities for single-phase alternating-current house-service watt-hour meters:—Bath, Blackburn, Bristol, Croydon, Eccles, Ipswich, Leeds, and West Ham Corporations, and the Beckenham, Rhondda, and Watford District Councils.

APPOINTMENTS AND PERSONAL NOTES

Mr. M. Barrington Baker has completed his contract with the Crown Agents for the Colonies in Zanzibar, and is now proceeding to Hong Kong as Chief Assistant Engineer to the China Light & Power Co., Ltd.

Mr. W. E. Pott, late General Manager to Messrs. Krupka & Jacoby, has been appointed manager of the electric novelty department of J. S. Hind & Co. (6 Eldon Street, E.C.), representing the Interstate Electric Novelty Co. of America.

Mr. W. T. Robson, Manager of the South Shields Corporation Tramways, has been appointed to a similar position at Southampton. The latter post was rendered vacant in order to allow Mr. H. F. Street to devote all his time to the Electricity Department.

Wiremen are required by John Brown & Co. (See an advertisement on another page.)

A materials superintendent and clerk is required in the St. Helens Electricity Department. (See an advertisement on another page.)

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £81 10s. to £82 10s. (last week, £78 10s. to £79 10s.).

Liquidations.—A meeting of Metalite, Ltd., will be held at the offices of Messrs. Vincent & Goodrich, 9 and 10 Pancras Lane, E.C., on May 20th, at 10.30 a.m., to hear the liquidator's account of the winding-up.

May 4th is the last day for receiving proofs in the liquidation of the Consolidated Diesel Engine Manufacturers, Ltd. Sir William Peat, liquidator, 11 Ironmonger Lane, E.C.

Half-Watt Lamps.—The General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), announce that for the future Osram half-watt lamps will be known by the name of Osram Atmos type lamps.

LOCAL NOTES

Arbroath: Street Lighting Tests.—The Gas Committee is to demonstrate the use of gas for street lighting in competition with the local electricity company. At present all the streets are lighted electrically.

Belfast: Electricity Staff Reorganisation.—The Corporation has considered, in Committee, the difficulties attending the proposed reorganisation scheme referred to in our last issue. According to the local papers, the matter has been again referred to the Electricity Committee to deal with.

Dublin: Electricity Works Reorganisation.—Councillor Sherlock proposes to ask the Corporation to appoint a Special Committee to inquire into a report upon the administration of the electricity undertaking; the prices charged for light and power; the number of engineers and workmen employed and paid out of revenue; the salaries and wages paid out of revenue; the procedure adopted with regard to purchasing coal; charge for interest and repayment of moneys borrowed.

Dundee: Depleted Electricity Staff.—The Electricity Committee has communicated with the War Office regarding further enlistments from their staff. Owing to the fact that already seventy-two men have gone to the colours, great difficulty is being experienced in maintaining the supply to foundries and jute establishments now engaged on important military contracts.

Ealing: Staff Enlistments.—Owing to the serious effect upon the working of the electricity undertaking which the number of men enlisting is having, the Council has decided to suspend, so far as the electricity works staff is concerned, the resolution to pay salaries or wages less army pay.

Edinburgh: Coal Costs.—In arranging its coal contracts for the coming year, the Electricity Committee reports that the total cost will be about £10,000 more than last year.

Liverpool: Annual Accounts.—The electricity accounts for the year to March 31st show a gross profit of £189,977, to which is added interest amounting to £399. After meeting capital charges and allocating £43,217 to renewals fund, the balance of £25,000 is transferred to relief of rates.

London: Marylebone: Postponed Works.—In view of the necessity for obtaining the Treasury sanction to new capital expenditure, the Electricity Committee has decided to hold over a scheme of installing trunk feeder protection apparatus. It was estimated to cost £6,500.

Manchester: Electricity Repair Shops and Munitions.—The Electricity Committee has offered the War Office the repair shops at Stuart Street generating station, which, it is said, has an up-to-date equipment capable of dealing with the manufacture of shells.

Barton Power Station.—So far the Treasury has not yet replied to the petitions of the Finance and Electricity Committees with regard to allowing the Barton power station scheme to go forward.

Newcastle-under-Lyme: Contract Cancelled.—Owing to the refusal of the L.G.B. to sanction a loan of £1,250 for cable, a contract provisional entered into with Callender's Cable & Construction Co. at £1,240 4s. has been cancelled.

Newport (Mon.): Increased Charges.—The recommendation of the Electricity Committee, mentioned in our last issue, to increase the charge for electricity supply by 20 per cent. led to a long discussion at the meeting of the Corporation last week. Several members urged that the increase was too large, and that the actual extra cost to which the Committee is now put does not exceed 10 per cent. Eventually, however, the increase was sanctioned.

Rhyl: Plant Extensions.—An expenditure of £2,500 has been incurred upon new plant to supply the Kinmel military camp with electricity. The War Office is bearing the whole cost of the plant.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Vickers.—A final dividend, making 12½ per cent. on the ordinary shares, is recommended, carrying forward £228,000. General reserve is previously credited with £250,000.

Babcock & Wilcox.—A dividend of 9 per cent. is recommended on the ordinary shares for the second half of 1914 (5 per cent. was paid for the first half of the year), and after placing £150,000 to reserve and £10,000 to staff pension fund, a balance of £69,500 is carried forward.

Shropshire Power Co.—The capital of the Shropshire, Worcestershire, and Staffordshire Electric Power Co. is to be converted from £5 shares into 900,000 ordinary £1 shares, whilst the unissued 150,000 ordinary £1 shares are to be converted into 6 per cent. cumulative preference shares. Powers are also taken to borrow £100,000 on mortgage.

NEW COMPANY

NEWTON BROS. (DERBY). 21 Market Place, Derby. Capital £31,000. To take over the existing business of electrical and mechanical engineers carried on by C. A., R., and H. Newton.

Crystal Palace School of Practical Engineering.—The taking over of the Crystal Palace by the Admiralty has in no way interfered with the activities of this school. A new course commences on Wednesday next. New students should attend on the previous day between 10 and 1.

SUMMARY

CONSIDERABLE progress is being made with the Electrical Emergency Service, and readers in London are invited to enrol, particularly those of over military age, who are willing to give four hours of their spare time daily so as to release younger men for military service. Further particulars will be found on p. 182.

A PAPER by Mr. A. Dickinson read before the Manchester Local Section of the Institution of Electrical Engineers on Tuesday described the water-power 100,000-volt transmission scheme of the Tata Hydro-electric Power Supply Co., Bombay. The Paper will be discussed at the London meeting of the Institution to-night (p. 183).

THE Yorkshire Electric Power Co.'s Bill, which sought electric lighting powers in some sixty-four local districts at present in the power supply area, was rejected, somewhat summarily, by a House of Lords Committee on Monday (p. 184).

AN appeal is made for recruits for the Royal Engineers, including men with electrical experience (p. 184).

THE Highways Committee of the L.C.C. has accepted the tender of the British Westinghouse Co. for two 8,000 kw. turbo-generators for Greenwich. Two firms tendered at lower prices, and the reasons for rejecting these tenders are given (p. 185).

SOME technical books are reviewed in this issue (p. 185).

AMONG the specifications published at the Patent Office last Thursday was one by Dr. I. Langmuir for

introducing mercury vapour into the bulb of gas-filled metal filament lamps to prevent volatilisation of the filament. Other subjects dealt with are renewable incandescent lamps, motor control, generator protection, and electric heaters. Two decisions of the Comptroller regarding opposition to applications of C. O. Bastian relating to helical filament lamps (p. 186).

At the Wireless Society of London last week, Prof. E. W. Marchant lectured on the question of the accurate measurement of wireless signals (p. 186).

THE measurement of the resistance of a fuse electrolyte is discussed in our "Questions and Answers" columns (p. 187).

AN electrically driven cloth printing machine is illustrated (p. 188).

A CRITICAL notice of the new number of the *B.E.A.M.A. Journal* appears on p. 188.

A NEW series of loan repayment periods for tramway capital has been adopted by the L.C.C., subject to the approval of the Treasury (p. 188).

AN expenditure of £8,500 is contemplated at Aldershot; a 1,000 kw. turbo-alternator is required at Dover; new plant and mains at Barnsley; transformers and converting plant at Mansfield; and converting plant and sub-station equipment at Bolton.—Cable, water-tube boilers, and car meters are required in Australia, and circuit breakers in Johannesburg (p. 189).

TWO-THIRDS of the pressure testing stations required by the L.C.C. have been erected.—The Manchester Electricity Department proposes to contribute £30,000 to relief of rates.—Coal has been discovered on the site of the new Bury power station (p. 190).

Engineer Volunteer Training Corps.—The replies received to the circular recently issued by the Institution of Electrical Engineers to the members residing in the London district have been communicated to the Central Association of Volunteer Training Corps, whose Engineering Adviser is of opinion that the response received is sufficient for the matter to be proceeded with. Enrolment forms have accordingly been sent to all those who have expressed willingness (conditional or unconditional) to join the proposed Corps. Further enrolment forms for members whose residence or occupation is in the London district can be obtained at the Institution of Electrical Engineers, Victoria Embankment, W.C.

Arrangements for the Week.—(To-day) Thursday, April 29th.—Institution of Electrical Engineers. "The Bombay Hydro-Electric Scheme," by A. Dickinson. 8 p.m.

Saturday, May 1st.—Royal Institution. Lecture I.: "Photo-Electricity," by Prof. J. A. Fleming, F.R.S.

Wednesday, May 5th.—Institution of Electrical Engineers. Students' Section. Annual meeting. Sir John Snell, President, will give an address. 7.45 p.m.

Friday, May 7th.—Junior Institution of Engineers, 39 Victoria Street, S.W. Imperial discussion. 8 p.m.

Royal Institution. Evening discourse. "Electrons and Heat," by Prof. O. W. Richardson. 9 p.m.

Saturday, May 8th.—Afternoon lecture, II.: "Photo-Electricity," by Prof. J. A. Fleming, F.R.S. 3 p.m.

THE ELECTRICAL EMERGENCY SERVICE

HERE has been a good response to our invitation to electrical engineers last week to enrol themselves in the Electrical Emergency Service, and it will be the means of relieving the difficulty with regard to switchboard attendants in some of the electricity works in and around London, and of enabling several of those of military age, who are now kept back, to join the Army. Electrical engineers of all ranks have applied for enrolment as temporary switchboard attendants, but there is room for many more—especially for those of a comparatively high standing in the profession and over military age whose knowledge and experience will enable them to perform the comparatively simple duties with only a few hours' or minutes' explanation of the details of the particular switchboard, station, and sub-station upon which their activities are to be directed. It should be understood that it is not *infra dig.* for such gentlemen to perform these duties at a time of national emergency, any more than it is unseemly for the peaceful householder who has never wielded a truncheon in his life (and whose only use for a whistle hitherto has been to call a cab) to enter the ranks of the Special Constabulary.

No electrical engineer need regret that he is too old to join the Army if he can temporarily take over the duties of another man of military age and enable him to do his duty to the country in the fighting line. When the war is over, every man will want to be able to realise what has been the share he has taken in the great struggle, and his children and grandchildren will want to know too. The man who can say that, although he was too old for the trenches, he yet did his share by modestly filling the place at home of a younger man, can feel that there is much to his credit.

Among those who have applied for enrolment are some men who are at present working as switchboard attendants already, and who are willing to put in four hours' work a day in addition to their present eight hours' daily work. We ask these gentlemen to ascertain first whether their services during the additional four hours would not be accepted by their present employers, and only to apply to us for enrolment and employment in other stations and sub-stations if their employers are satisfied that they should do so.

Owing to geographical considerations (which are of considerable importance when midnight duty is in ques-

tion), and the varying requirements and conditions of the different electricity works, it has not been possible to give immediate effect to all the applications received, but by the time this appears in print several members should have been placed, and several others are being held in readiness to replace further enlistments in Kitchener's Army and in the important industrial army which supplies it with ordnance and ammunition. But although the response has been good during the past week, many more men are still required for the Electrical Emergency Service, and we invite further applications.

THE following Engineers and Managers of electricity works, &c., in Greater London have expressed their approval of the Electrical Emergency Service:—Mr. Sydney W. Baynes (St. Pancras), Mr. A. W. Blake (Willesden), Mr. J. H. Bowden (Poplar), Mr. E. Calvert (Finchley), Mr. A. C. Cramb (Croydon), Mr. C. S. Davidson (Barnes), Mr. A. L. C. Fell (L.C.C. Trams.), Mr. Herbert Jones (Waterloo—City and L. & S.W. Rly.), Mr. G. W. Keats (Woolwich), Mr. J. D. Knight (Ealing), Mr. W. E. J. Heenan (Bermondsey), Mr. G. W. Partridge (London Electric Supply Co.), Mr. G. M. Powell (Smithfield Markets Electric Supply Co.), Mr. L. L. Robinson (Hackney), Mr. E. T. Ruthven-Murray (North Metropolitan Electricity Power Supply Co.), Mr. Roger T. Smith (S.W. Rly.), Mr. C. P. Sparkes (County of London Co.), Mr. H. W. Sprunt (South London Electric Supply Corporation), Mr. G. R. Spurr (Walthamstow), Mr. H. P. Stokes (Bexley), Mr. J. E. Tapper (Beckenham), Mr. W. C. P. Tapper (Stepney), Mr. H. Tomlinson-Lee (Wimbledon).

Applications for enrolment, on the form below, should be sent to the Editor of ELECTRICAL ENGINEERING, 203 Temple Chambers, London, E.C., who will be pleased to reply to any inquiries for further information, and from whom also further application forms may be obtained.

The Service Required.

- A. A full eight-hour shift a day, or—
- B. A half-shift (four hours) daily (1st week morning, 2nd week afternoon, 3rd week night, in rotation).
- C. A half-shift every day, without midnight work.
- D. A half-shift alternate nights with no day work.

To prevent any suggestion of competition with regular employees, wages will be paid in proportion to the existing rates at the works at which the member is employed, and to the time given.

A week's notice will be required from any member leaving the Service.

APPLICATION FORM.

(Please cut out, fill in, and return to the Editor of "Electrical Engineering," 203 Temple Chambers, London, E.C.)

I wish to be enrolled as Member of the Electrical Emergency Service.

Age..... Married or Unmarried.....

Qualifications (state electrical experience)

.....
.....
.....

I am willing to work a full shift as (A) (above),

a half shift as (B), (C), (D).

(Delete the line and letters not applicable.)

My regular occupation prevents me at present from giving electrical emergency service between.....a.m. and.....p.m.

Signature

(Please write very
distinctly, and give
addresses very fully.)

THE BOMBAY HYDRO-ELECTRIC SCHEME

A PAPER by Mr. A. Dickinson, describing the water-power scheme of the Tata Hydro-electric Power Supply Co., Ltd., which supplies energy to Bombay principally for the driving of cotton mills, was read at the Manchester Local Section of the Institution of Electrical Engineers last Tuesday, and will also be discussed at the London meeting of the Institution to-night. The power station is at Khopali, forty-three miles from Bombay, and special features of the scheme are the large water storage necessary owing to the climatic conditions and the use of a pressure as high as 100,000 volts for transmission. The present capacity of the generating plant is 55,000 h.p., and this will ultimately be increased to 88,000 h.p.

The storage lakes are three in number. The smallest, Lake Lonawla (986 acres, 361 million cu. ft. of water) is intended principally for use during the monsoon period, and when this is empty water is drawn from lakes Walwan (1,535 acres, 2,560 million cu. ft.) and Shirawta (3,174 acres, 6,963 million cu. ft.). These lakes were formed by suitable dams aggregating 17,000 ft., and the outlet of the Shirawta lake is connected to Walwan lake by a tunnel 5,000 ft. long. The design and material of the dams, sluices, &c., are described at some length in the Paper. Water from the lakes is taken by ducts totalling 4·6 miles, with a capacity of 120,000 h.p. at a maximum water velocity of 5 ft. per sec., including several aqueducts and tunnels to the forebay, which has a storage capacity for 1½ hours with the whole of the eight sets working. Openings are provided in the dam for three 82-in. pipes, and the gates for these are worked through racks either by hand or by a 12-h.p. motor, which gives a gate-lifting speed of 13½ in. per min., and can open a gate fully in eight minutes. Special provision is made for closing the gates rapidly from the power-house in case of emergency by a solenoid which releases the ratchet-wheels so that the gates close by their own weight, but are prevented from being damaged by falling too quickly by automatic brakes. The pipe-line from the forebay to the power-house is one of the largest ever built. The top part consists at present of one upper pipe 8,200 ft. in length, a distributing pipe and four lower pipes 4,800 ft. in length. This is half the ultimate equipment. The upper pipe is in three sections, the first two of riveted steel 3/8 in. and 13/16 in. thick, 82½ in. and 76¾ in. in diameter, and the third of lapwelded steel 72 in. diameter and 11/16 in. to 13/16 in. thick. The lower section is all lapwelded steel from 42 to 38 in. diameter and ½ to 1¼ in. thick. The whole pipe-line is laid above ground, is provided with suitable expansion joints, and was supplied by Escher Wyss & Co. (Zurich). The total static head is 1,725 ft., and there is a loss of head of 66 ft. with four turbines running at 11,000 h.p. each.

The power-house is designed for a plant capacity of 88,000 h.p. in eight main sets, two 860-h.p. exciter sets, eight step-up three-phase 10,000-k.v.a. transformer banks, with the necessary switchgear, station auxiliary apparatus, and four outgoing lines. The present building will accommodate five sets and two outgoing lines, and is capable of extension. The main sets consist of Escher-Wyss horizontal shaft impulse turbines running at 300 r.p.m., coupled to Siemens three-phase generators. The exciter sets are driven by tangential wheels running at 600 r.p.m. The governors of the main turbines are of the oil-pressure servo-motor type, controlling the deflecting nozzles, and are guaranteed to limit the speed variation to 2½, 5, and 12 per cent. when 25, 50, and 100 per cent. of the load is thrown off suddenly. The guaranteed full-load efficiency of the main turbines is 82 per cent. and of the exciter turbines 77 per cent.

The main generators are of the totally enclosed type, ventilated by fans on the motor shafts. The air supply is controlled by shutters worked by electric motors, and automatically controlled so that when the field switches are closed the shutters are open and vice versa. Each generator is designed for a full-load normal rating of 8,000 kw. at a power factor of 0·8, and 4,000 to 5,300 volts 50 cycles three-phase with a temperature rise not exceeding 60° F. above air at 110° F., and 20 per cent. overload for ten hours without injury. The full-load efficiency at 0·8 power factor is 94·3 per cent., with an inherent regulation of 9 per cent. at unity and 22 per cent. at 0·8 per cent. power factor. The exciters are rated 600 kw. each. Each main set requires 25 to 38 kw. excitation, according to the power factor.

The transformers are in banks of three single-phase oil-immersed water-cooled units, delta connected, and designed for an output of 3,333 k.v.a. at 0·8 power factor when stepping-up from 5,000 to 100,000 volts, with a water circulation of 950 gallons per hour. The full-load efficiency at 0·8 power factor is 98·1 per cent., and the efficiency at half-

load 97·2 per cent., and the regulation 0·8 per cent. at unity power factor, and 4·6 per cent. at 0·8 power factor. On account of the high voltage, special terminal bushings are used. The high-tension bushings are of the compound-filled type, and consist of a conductor rod from the top to the bottom which is surrounded by several concentric press-board insulating cylinders, separated by spaces, outside which the exterior wall of the bushing is built up of a number of annular rings of moulded insulating compound, interspaced with impregnated press-board discs of larger diameter than the rings in order to prevent leakage. These discs and rings are cemented together, and are tightly clamped by nuts at the top and bottom of the rod. The bushings are supported on cast-iron rings attached to the cover. The low-tension bushings are of porcelain. A special testing set is provided for testing oil with a 0·2 in. spark gap. The oil is filtered until the puncture voltage is raised to 40,000 volts. Very complete arrangements for oil and water supply are provided.

The switchgear is arranged so that each main unit may be run on its own transformer bank or through transfer bus-bars on any other bank. On the H.T. side the transformers and outgoing lines are worked in parallel. The oil switches are arranged in groups of three independent solenoid-operated single-phase switches to work as one switch, with a breaking capacity of 40,000 k.v.a. Reverse time-limit overload releases are provided only on the high-tension side of the transformers. The H.T. connections are copper tubing on post insulators arranged for a phase spacing of 5 ft., and an earth-striking distance of 3 ft. The switchgear permits of sectionalisation of the H.T. bars and a water rheostat-testing circuit, as well as a 200,000-volt testing transformer, is provided for. The whole control is from a marble bench-board, and the switch-gear is worked from a 220-volt 60-ampere 8-hour battery in conjunction with an 18-kw. motor-generator. The generator field rheostats and other auxiliaries are also motor-driven from this battery. The auxiliary switchboard also controls station power and lighting from two 312-k.v.a. 440-volt transformers. A stand-by service for these purposes is supplied by two 80-kw. Diesel engine-driven sets. Both Tirrill and Brown-Boveri voltage regulators are provided to control the pressure on the 100,000-volt bus-bars. Each outgoing line is protected with choke coils and an aluminium-cell lightning-arrester equipment complete with horn gaps, disconnecting switches, a discharge alarm, and discharge recorders. The generators are star-wound for operation with an unearthed neutral, and for protection against pressure-rises are provided with "over-tension" apparatus, consisting of isolating switches, static discharges, and star-delta horn-gap arresters. Earthed bus-bars are run throughout the length of the building, and copper earth-plates are provided for connecting up to the lightning arresters and other apparatus.

The transmission line is 48 miles in length, and crosses two tidal creeks, one 10,000 ft. wide. There will ultimately be four circuits on two lines of towers, with two change-over stations for dividing the line into three sections for cutting out or interconnecting different sections as required. The present installation comprises two circuits on one line of towers, insulated for a working pressure of 100,000 volts between phases. The conductors consist of 7-strand hard-drawn copper, with each wire 0·095 sq. in. section; for creek crossing silicon bronze wires are used. Individual wires of each conductor are drawn in as long lengths as possible, and where joints are used they are silver brazed, the conductors being supplied in standard lengths of 2,200 yards. For joining up on site a twisted sleeve, mechanical joint is used. The conductors are spaced 10 ft. 6 in. apart, and in the case of the intermediate towers are arranged delta fashion on either side of the tower, suspended on 6-unit insulators. In the case of the anchor towers the conductors are arranged vertically on either side of the tower and are suspended on 6-unit insulators. For the creek-crossing towers 7-unit insulators are used, the conductors being arranged vertically over one another on either side. The suspension insulators, which are 10 in. in diameter, are of two types, viz., of the metal hooded type with ball joints for using vertically on intermediate towers, and of the link type for using horizontally on anchor towers.

Three patterns of steel tower are used for ordinary suspension, anchoring, and creek-crossing, and about 500 are used in all. The ordinary towers are 62 ft. high and 500 ft. apart, and the creek-crossing towers are 160 ft. high, 1,175 ft. apart, and are each carried on four concrete-filled caissons. The wires have to be kept 80 ft. clear of the water. A telephone line is carried on the same towers as the power line, and for removing static disturbances in the telephone line, in event of a fault in the power circuit, a special type of "drainage coil" is used. A galvanised steel guard-wire cable is carried over each power circuit. The equipment at the

change-over stations in the line consists of four triple-pole, single-throw, 100,000-volt, bolt-type, out-of-door, disconnecting air-break switches, which are mounted on 7-unit insulators fixed on wooden supports on the towers, and are operated by rods from the ground through bevel gears and rack. Each of the present circuits will transmit a load of 15,000 kilowatts at 0·8 power factor with a regulation of 11 per cent. and a line efficiency of 93 per cent., and a load of 20,000 kilowatts with a regulation of 14 per cent. and a line efficiency of 91·5 per cent.

The receiving station is situated at Parel on the Island of Bombay. It has been designed for an ultimate plant capacity of 74,880 k.v.a. in eight three-phase step-down transformer banks of 9,360 k.v.a. each, and four incoming lines with the necessary switchgear and station auxiliary apparatus, of which five complete units and two incoming lines are now being installed. For improving the power factor and regulation of the system, duplicate synchronous-condenser sets are provided, each consisting of a 6,600-volt, 50-cycle, 500 r.p.m., three-phase synchronous motor with a 125-volt exciter on the overhung part of the shaft. The feeder distribution system from the receiving station to the mills is designed for a 6,600-volt 50-period three-phase supply with an unearthing neutral.

The mills are driven by induction motors on the group-drive principle, controlled by liquid starters, and a sub-station is provided at each mill. The present contract covers thirty firms, requiring 63 transformers aggregating 39,500 k.v.a. and 199 motors aggregating 37,525 h.p. The power requirements of individual mills ranging from three motors aggregating 325 b.h.p. to 19 motors totalling 2,400 b.h.p. The terms of the agreement between the company and the mill-owners cover the supply of energy for power purposes in Bombay at 0·55 anna per unit in the case of mills where the company supply the complete equipment, and at 0·5 anna per unit in the case of mills which provide their own motor equipment, the company providing and maintaining the mill transformers. Energy for lighting is supplied at 1·25 annas per unit. The agreement is for a period of ten years.

YORKSHIRE ELECTRIC POWER BILL

Lighting Powers Refused

THE Yorkshire Electric Power Company's Bill, by which the Company sought powers to supply electricity for lighting purposes in some 64 districts in its area, was rejected by a House of Lords Committee on Monday, without the opposition being called upon to state their case. The Leeds, Sheffield, Rotherham, Huddersfield, Wakefield, Halifax, Bradford, and Barnsley Corporations opposed, in addition to the Brighouse Urban District Council, Great Northern Railway, and ten gas companies.

At present the Power Company is only authorised to supply in bulk and for power purposes, any power consumer being entitled to use 20 per cent. of his total consumption for lighting purposes. The Company's original Act was passed in 1901, and as was done in the case of all the early power companies, the districts of the large municipalities in the proposed area of supply were cut out, but wayleaves had to be granted for the purpose of carrying mains through to other parts of the power area, subject to an appeal to the Board of Trade in case of dispute. The Company regards it as an absurd anomaly, that whereas a power user is able to obtain under the 20 per cent. clause, all the electrical energy required for lighting, his next-door neighbour may be unable to obtain a supply for lighting at all because he does not take a supply for power. Hence it was that last year a proposal was put before all the local authorities in the Company's area for whose districts lighting powers do not exist, that the Company should supply for lighting. The Bill was thrown out on a technical point early in the session, but the application was renewed this year. In order to avoid as much opposition as possible, the offer was made to cut out those local authorities who did not approve of the Company's scheme, but although 20 such areas have been cut out, there are still 64 in the Bill, the councils to which have either definitely approved or did not oppose.

The opposition divided itself into three classes, namely, the gas companies, the large county boroughs, and the railway companies. The latter objected to an extension of the Company's existing powers to break up their bridges, &c., but the offer was made to submit any application for laying lighting mains on the railway companies' property to the Board of Trade. The position of Sheffield, Leeds, and the other large towns is that at present under what is known as the "fringe" clause in the Electric Lighting Act of 1909, these authorities may supply any areas just over their existing municipal boundaries, and that what is now sought by the Power Company would enable competition to take place with them. Furthermore it is argued that complications would arise by the granting of these powers in the event of the municipalities extending their boundaries at some future date.

So far as the gas companies are concerned the opposition

was based on the fear of competition and emphasis was placed upon the fact that the Company did not propose to place itself in the position of an ordinary electric lighting company in regard to certain details, and this, it was claimed, made the competition unfair. It was pointed out that there was no obligation upon the Company to lay mains in any particular district, nor was any compulsory area scheduled in any of the districts. Similarly, the right of purchase on the part of the local authority did not exist. In this connection the Board of Trade had issued a report in which the same point of view was taken, and it was suggested that the Company, through its subsidiary concern, The Electrical Distribution of Yorkshire, Ltd., should continue to do what it has done in regard to some 16 other districts, namely, apply for separate provisional orders. This, however, it was argued by the Company, would not be profitable because the best districts available for lighting have already been dealt with in this way, and the remainder could not possibly support self-contained undertakings of the character suggested. Indeed, orders have been obtained in some cases, and allowed to lapse for this very reason. A clause had been agreed between the local authorities concerned and the West Riding County Council, by which if a supply is not given in any particular district before the end of five years from the passing of the Act, an application may be made to the Board of Trade to revoke the powers.

In support of the Company's application, two precedents were quoted, namely, the Kent Electric Power Co., which obtained electric lighting powers in its area in 1906, and the North Metropolitan Electric Power Co., in 1907. The former was unopposed, whilst the latter was opposed by the Walthamstow Urban District Council, whose district was cut out of the Bill at their request.

Mr. W. B. Woodhouse, the engineer to the Company, gave evidence on Friday. The Company is making considerable development in the use of coke oven gas for generating stations. Already one is in operation at Barraugh, and a considerable addition to the plant there is contemplated. Two others are also in hand, one at Castleford, and another near Doncaster. It is anticipated that the whole of the districts contemplated in the Bill can be dealt with from the lighting point of view for an expenditure of £60,000.

On Monday, after local evidence in support of the Bill had been heard, the Committee sent for a representative of the Board of Trade.

Mr. H. Booth, of the Board of Trade, confirmed the views expressed in the report referred to above, and said that when the electric power companies first came into existence, the intention was that they should concentrate on bulk supply and large power users, leaving the smaller local distribution to be in the hands of the local authorities. Many difficulties would present themselves in the event of a local council desiring to buy out the Company in its district. No terms of purchase were specified in the Bill, and it was probable that an arbitrator would have to take into account the fact that the Company held its lighting powers in perpetuity. Under the Electric Lighting Act of 1888, definite provision was made as to the terms upon which purchase was to take place, but this Act would not be incorporated in the present Bill.

As mentioned above, the Chairman announced, without calling on the opposition, that the clauses in the Bill relating to lighting could not be allowed, and as only a few subsidiary matters remained, the promoters intimated their intentions of not proceeding further.

ROYAL ENGINEERS

THE 1st London Divisional Engineers have recently enlisted a large number of recruits as a result of the special efforts put forth, but further men are still required for both Field and Signal Companies in the third line formations.

Men urgently required are those connected with the building constructional trades, bricklayers, carpenters, harness-makers and saddlers, blacksmiths, wheelwrights, shoemakers, telegraphists, electricians, instrument makers, telephone operators, and men accustomed to horses.

The 1st London Field Company has received very high praise for its work in France, the men having carried out their special work of preparing defence works, making temporary roads, bridging streams and water channels, cable-laying, and the establishment of field telegraphic communications, &c., under very hazardous, hard, and trying conditions.

It is desired that the men coming forward for the new companies shall maintain this splendid reputation for skill in work, individual pluck, and collective enterprise. The need for skilled men is great, and, of course, the pay is proportionately higher than in most other arms of the Service. A fully qualified carpenter can earn up to 45s. a week whilst in London, and 33s. 6d. plus the usual children's allowances whilst at camp. Full particulars can be obtained by application, personal if possible, to Headquarters, 10 Victoria Park Square, Bethnal Green, N.E., or to the Branch Recruiting Office, 451 Edgware Road, W.

THE L.C.C. NEW TURBO-GENERATORS

THE following tenders have been received by the L.C.C. for two 8,000-kw. turbo-generators for Greenwich:—
Cole, Marchent & Morley, Ltd., Bradford, £15,313 10s. (incomplete).

British Thomson-Houston Co., Ltd., Cannon Street, E.C., £51,070 (incomplete).

James Howden & Co., Ltd., Glasgow, £55,161 (incomplete).

James Howden & Co., Ltd., Glasgow (alternative tender), £56,720 (incomplete).

Maschinenfabrik Oerlikon, Switzerland, £57,600.

Fraser & Chalmers, Ltd., Erith, £58,012.

Fraser & Chalmers, Ltd., Erith (alternative tender), £59,709.

British Westinghouse Co., Ltd., Manchester (accepted tender), £62,003.

Fraser & Chalmers, Ltd., Erith (alternative tender), £63,816.

Escher Wyss & Co., Switzerland, £64,016.

Willans & Robinson, Ltd., Rugby, £64,620.

Willans & Robinson, Ltd., Rugby (alternative tender), £65,619.

Escher Wyss & Co., Switzerland (alternative tender), £66,311.

Willans & Robinson, Ltd., Rugby (alternative tender), £66,795.

Brush Electrical Engineering Co., Ltd., Loughborough, £67,062.

Willans & Robinson, Ltd., Rugby (alternative tender), £67,442.

Dick, Kerr & Co., Ltd., Cannon Street, E.C., £68,100.

The Highways Committee report that it was necessary to pass over the lowest complete tender, viz., that of Maschinenfabrik Oerlikon of Switzerland, on account of the difficulty which would be likely to arise in the transport of raw materials and of the completed work, and in the inspection of the machinery during manufacture. The next lowest tenders, viz., those submitted by Messrs. Fraser & Chalmers, have also been passed over on the advice of Sir Alexander Kennedy for the reason that this firm, although of the highest standing, have not constructed any turbines of a larger capacity than 3,000 kw. In view of the fact that the early delivery and smooth and speedy operation of these machines were of the utmost importance for the safe working of the undertaking, the Committee has felt bound to take into serious consideration the experience which the different firms tendering have had of machines of the type and size in question. The result is that the Highways Committee has accepted the next lowest tender, viz., that of the British Westinghouse Co., who have supplied four of the five turbo-generators at Greenwich.

REVIEWS OF BOOKS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

Text-book on Wireless Telegraphy. By R. Stanley. 344 pp. 9 in. by 5½ in. 201 figures. (London : Longmans, Green & Co.) 7s. 6d. net; abroad, 8s. 2d.

We have little doubt that Prof. Rupert Stanley's text-book on wireless telegraphy will become the most popular text-book on this subject. It starts from the beginning—not from the historical beginning, but from the logical and scientific beginning—assuming no knowledge of the theory of electricity and magnetism, but imparting just sufficient of it to enable an ordinary student not over-gifted with mathematical knowledge to understand and appreciate the principles which underlie the practice of wireless telegraphy. Starting with a chapter which gives the reader a conception of the ether, and another explaining the electron theory in a simple and elementary manner, but at the same time, clearly and soundly, he passes on to magnets and the idea of magnetic lines of force. Calling these lines of strain, he next devotes merely enough space to static electricity to familiarise the student with the conception of electric strain. Then come four more chapters—electrical measurements; capacity and induction effects; induction coils, alternators, and transformers; and oscillatory discharges,—and a firm foundation has been laid upon which to build up the proper teaching of wireless telegraphy as a simply-understood application of the principles already learnt. The history of wireless telegraphy is given briefly and well, and the technical treatment of the subject is a sound and up-to-date description of present-day methods and apparatus.

In the chapter on undamped-wave systems, near the end of the book, an interesting section is devoted to the new Marconi system of continuous oscillations, but only a few lines are given to wireless telephony. Perhaps, however, the author is wise in practically confining himself, in the technical part of the book, almost entirely to that which has been accomplished and in successful operation, and avoiding the description of recent researches, the materialised results of which are still in the early and consequently rapidly-changing stages of development.

Wireless telegraphy is now an industry, and many are engaged in it who could not hope to master the complete mathematical and physical theory of electromagnetic radiation. Prof. Stanley has provided them with precisely the text-book which they should have; and he has also a gift which the writers of many excellent text-books do not possess, the art of being interesting. The book draws one into it as one reads, and many students will be deep into the subject before they realise the rapidity with which they are learning.

Electrical Engineering: A First Year Course. By F. Shaw. 147 pp. 8½ in. by 5½ in. 80 figures. (London : George Routledge & Sons, Ltd.) 2s. net; by post, 2s. 3d.

The chief utility of this book should be for the student who desires, during the vacation, to recapitulate the matter which has been dealt with in lectures and class-work during the term, and to consolidate his knowledge. But as a text-book, to teach step by step, it would not be employed successfully, except as an auxiliary to work under an extremely able teacher. For instance, the elementary fact that the total resistance of a number of resistances in series is obtained by simple addition is not stated as a more or less obvious one, but is deduced from Ohm's and Kirchhoff's laws; these laws are also invoked to prove that the joint conductance of a number of circuits in parallel is the sum of their individual conductances; and, finally, the two rules thus proved are applied to "discover" the relation between the resistance of a conductor and its length and cross section. It is like teaching a child to indicate the position of its right ear by pulling its left wrist round the back of its neck. Dynamo and motor armatures and fields are referred to as early as the seventeenth page of the book, and long before the dynamo and motor are described, in order to illustrate the conception of back E.M.F. The choice of the "Examples" (mostly in the form of City and Guilds examination questions) at the end of the various chapters are also frequently unfortunate, as to answer them correctly often involves knowledge which has not been imparted in the pages which precede them.

Brown's Marine Electrician for Sea-going Engineers. By A. E. Larkman and A. H. Larkman. 244 pp. 7½ in. by 5 in. 179 figures. (Glasgow : James Brown & Son.) 5s. net; abroad, 5s. 4d.

We had hoped, perhaps unjustifiably, from the title that this would be a practical and technical handbook to tell the electrician who is competent on land the points of difference between land and marine practice. The object of the book, however, is to give the marine engineer some instruction in things electrical, and we are bound to admit that the instruction given is at times rather crude. In a four-line preface to the second edition the authors state that the volume has been thoroughly revised and brought up to date, but exception must at least be taken to the word thoroughly. As a typical alternator an old Siemens revolving armature type is given, from which "a number of separate circuits may be supplied . . . by dividing the armature into sections and fitting as many pairs of slip-rings as there are sections." A little later we read : "Since the introduction of transformers, alternators have again come into use; they have been used and discarded intermittently by electrical engineers, but now their use aboard large vessels is probable." The reader is given the information that the series dynamo is "falling into disuse"; that the tree system of wiring was used exclusively for ship work until a short time ago, and "is now giving place to what is known as the 'distribution' or 'multiple circuit' system," and that voltmeters are not left permanently on circuit, but are switched on only when a reading is required, so as not to heat the coil. The chapter on instruments and testing is absolutely archaic.

British Association.—For the meeting which is to be held at Manchester from September 7th to 11th, under the presidency of Prof. A. Schuster, F.R.S., the following sectional presidents have been appointed :—Section G (Engineering), Dr. H. S. Hele-Shaw, F.R.S.; Section A (Mathematics and Physics), Sir F. W. Dyson; Section B (Chemistry), Prof. H. B. Baker.

Wiremen's Wages.—It is stated that the electricians employed on ships in the Port of London have been granted a 48-hour week and an increase of wages to 1s. per hour. We notified in a recent issue that the men had threatened to strike unless these demands were granted.

Municipal Wiring.—The South Shields Corporation Bill, which includes powers to wire and fit premises through a contractor, was before a House of Lords Committee last week. There was no opposition to the proposal in question. Through confusion with another Bill, we unfortunately stated on page 124 of our issue for March 18th that the wiring powers of the Doncaster Corporation had been granted. As a matter of fact, the clauses dealing with wiring were struck out of the Bill before it reached the Committee.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 22nd, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

29,751/13. **Renewable Lamps.** V. TERRY and E. TERRY. Incandescent lamps in which the filaments may be renewed without wholly destroying the lamps. The filament support is mounted on a stopper or plug, which fits in the neck of the bulb. Provision is made to exhaust the bulb through a channel in the plug. (Four figures.)

624/14. **Motor Control.** G. ELLISON and M. R. H. MUELLER. Automatic cut-out for crane motors to break the circuit on an undue rise in speed of the motor. The controlling solenoid is provided with two windings, one in shunt with the armature, and the other in series with it, so adjusted that when a high back E.M.F. is attained on high speed with low load, such as when a heavy load is lowered too fast or a light load raised too quickly, the circuit is broken. (One figure.)

8,173/14. **Generator Protection.** B.T.-H. Co., F. H. CLOUGH, and J. WHITCHER. A method of protection of A.C. generators having parallel windings in the armature, in which the action depends on a comparison of the inductive effects of the current, in the parallel windings, or the current in one winding, with the sum of the currents in all the windings, so that the generator is disconnected in the event of an internal fault. (Four figures.)

17,326/14. **Incandescent Lamps.** I. LANGMUIR. High efficiency gas-filled lamps, in which a small quantity of mercury or other substance is contained in the bulb, which vapourises as soon as the lamp is hot. This vapour has an even better effect than inert gases, such as nitrogen, in preventing the volatilisation of the filament. (Three figures.)

17,945/14. **Electric Heaters.** R. WEAVING, F. SMITH, and FERRANTI, LTD. An electric heating element formed of a number of porcelain bars threaded on metal rods, each bar being provided with a single longitudinal ridge having two or more lateral projections on each side to hold in position a coil of helically-wound wire placed in a zig-zag position between the bars. (Nine figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Arc Lamps: AYRTON [Carbons] 8,505/14.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: B.T.-H. Co. (G.E. Co., U.S.A.) [System of distribution] 14,577/14.

Heating and Cooking: QUAIN [Heaters] 136/14, and [Water heaters] 3,221/14.

Instruments and Meters: CHAMBERLAIN & HOOKHAM, LTD., and SPRAGUE [Mercury motor meters] 14,841/14.

Switchgear, Fuses and Fittings: CELERI [Resistances] 9,411/14.

Telephony and Telegraphy: WITHERS (Coz) [Submarine telegraphy] 399/14; COMER [Telephone transmitters] 8,049/14; BETULANDER, PALMGREN, and GRAHN [Automatic telephones] 8,946/14; WESTERN ELECTRIC CO. (Woodward for W.E. Co., U.S.A.) [Telephone switching apparatus] 12,912/14; AUTOMATIC TELEPHONE MANUFACTURING CO. and SPERRY, 17,590/14.

Traction: SALMON and DODASON [Signalling] 11,801/14; WIGHT [Signalling] 11,805/14.

Miscellaneous: JONES and LIGHT STEEL TUBULAR WHEELS, LTD. [Welding] 8,804/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Traction: RENAULT [Car lighting] 24,121/14.

Miscellaneous: LANDIS & GYR A.G. [Spring contacts] 5,007/14.

Opposition to Grant of Patents

21,029/13. **Lamp Filaments.** C. O. BASTIAN. An appeal has been lodged against the Comptroller's decision to refuse a grant on this application. The specification describes lamps with wire filaments in helical form, with the convolutions arranged at a distance from one another equal to, or less than, one-half the diameter of the wire.

22,331/13. **Lamp Filaments.** C. O. BASTIAN. An appeal has been lodged against the Comptroller's decision to allow a grant

on this application, in spite of opposition. The specification describes helically-wound drawn-wire filaments, in which the wire is provided with a coating during preparation to keep the convolutions apart. This coating is removed after mounting the filament.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:—

9,284/01. **Railway Signalling.** E. TYER, F. T. HOLLINS, and F. W. LEAKE. A three-indication instrument for use at crossing gates, &c.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: I. LADOFF and J. MACNAUGHTON [Lamp electrodes containing titanium] 226/04.

DYNAMOS, MOTORS and TRANSFORMERS: SIR W. G. ARMSTRONG, WHITWORTH & CO. and C. H. MURRAY [Motor control] 439/09.

Switchgear, Fuses and Fittings: E. M. HEWLETT and T. E. BUTTON [Remote control oil switches] 15,955/02; T. McCLELLAND [Lamp-holders] 299/09; H. F. REASON and REASON MNF. CO. [Time switches] 353/09; J. J. RAWLINGS [Tumbler switches] 373 and 27,446/09; D. K. MORRIS and G. A. LISTER [Voltage regulators] 416/09.

Telephony and Telegraphy: V. POULSEN [Magnetic recording and reproducing of telephone signals] 541/03; E. A. HYTTEN [Telephones] 425/08.

Traction: G. W. MASCORD [Petrol-electric traction] 608/07.

Miscellaneous: J. H. and A. B. DRÄGER [Lamp for helmet of miner's rescue dress] 559/08.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

At the meeting of the Wireless Society of London on Tuesday, April 20th, Prof. E. W. Marchant delivered a lecture on "The Accurate Measurement of Wireless Signals." To a large extent it covered the same ground as his recent Institution Paper (ELECTRICAL ENGINEERING, February 11th, p. 60). He emphasised, however, the need of an increase in the amount of work of this kind being done throughout the country. Before attempting to make any experiments on the strength of received signals it is necessary, he said, as far as possible, to have constant conditions at the receiving station. The aerial should be of a standard pattern, and as free as possible from surrounding obstacles such as trees and houses. A second factor to which attention should be paid was the resistance of the aerial to earth, as in order to get good results the earth resistance should be as constant as possible. He had used a water-pipe system at Liverpool with satisfactory results. Having described a number of instruments for detecting wireless signals, Prof. Marchant said that the best was the instrument which would read the actual current or voltage on the antenna circuit. For extremely small powers the Duddell thermo-ammeter was probably the most sensitive alternating-current instrument. The elimination of atmospherics was a matter of great difficulty, and very frequently in the summer, even in Liverpool, it was necessary to have a conducting leak from the aerial to earth. A coupled secondary circuit for receiving the signals was greatly to be preferred to direct measurement. There was a certain loss of power, but the advantages to be gained in greater selectivity far outweighed any small loss in efficiency. In the course of a short discussion Mr. W. Duddell said he had been endeavouring to interest as many people as possible in the measurement of wireless signals. He had been three times to Brussels to get the nations of the world to make international measurements, but the war stopped the first co-ordinated attempt at these measurements during the eclipse. Even now, when all wireless work was prohibited, a lot of work could be done in trying to develop instruments which would actually measure the oscillating current itself either in the aerial or a circuit coupled to it. More sensitive instruments were required.

**QUESTIONS AND ANSWERS
BY PRACTICAL MEN**

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,440.

A mixed load (90 per cent. induction motors) of 300 kw. is required at 450 volts, three phase, 50 cycles, at a distance of 200 yards from the supply. Calculate size of three-core paper cable, and prove that it is the economical size when supply is 5d. per unit.—"CABLE."

(Replies must be received not later than first post, Thursday, May 6th.)

ANSWERS TO No. 1,438.

Could any reader describe in detail the apparatus used in taking the ohmic resistance of an electrolyte of fused salts, especially the apparatus containing the salt?—"ELECTROLYTE."

The first award (10s.) is made to "L.R." for the following reply:—

The apparatus for containing a fused electrolyte depends on the melting-point of the electrolyte. For instance, with low melting-points the apparatus used can be the same as that employed in connection with conductivity or resistivity determinations of solutions. In any event, the container should be non-conducting through the range of temperatures employed; it should be chemically inert to the action of the fused salts, and should be so arranged that a large electrode area can be used. It should not be variable over the temperature range employed, or if it be variable the change should be definitely determinable. A simple container is made of porcelain and in the form of a U, having expansions or cups at the top of the arms. The dimensions for fused electrolytes are as follows:—8 mm. internal diameter throughout the U; width across the two arms, 45 mm.; height from top of the arms (*i.e.*, base of extensions) to bottom of the U, 50 mm.; diameter of extensions, 16 mm.; height, 25 mm. The electrodes are formed of platinum cylinders, one in each cup, and rest on the bases of the cups. Their sizes are:—Height, 12 mm.; diameter, 14 mm.; and thickness of metal, 1·5 mm. Platinum wires lead the current to the electrodes. The apparatus is filled with electrolyte almost to the top of the cups, and is immersed in a suitable bath or furnace. A long description of the use of this apparatus is to be found in *Zeit. E. Chem.*, Vol. 12, p. 337. Another form comprises a plain thick walled capillary made of quartz, the bore being 1·5 mm. This is provided with platinum elbows, which form the electrodes, and to which leading-in and suspending wires of platinum are attached. A complete description of this form is to be found in "Transactions American Elec. Chem. Soc.," Vol. XI., p. 211.

To use either apparatus, it is connected in one arm of a Wheatstone bridge arrangement, another arm containing a resistance box of fixed value, and the other two being formed by a metre wire not less than $\frac{1}{4}$ mm. thick, formed of platinum iridium alloy or of constantan. In place of the usual battery a small induction coil excited by a battery is used, and in place of the galvanometer a telephone is employed. It is found best in practice to connect the telephone across the ends of the metre wire, and the induction coil has a fixed point of contact between the bath and the fixed resistance, the other contact being movable along the wire. The resistance box must contain either non-inductive resistances, or (preferably) in cases where the resistances are of high value, a thousand ohms or more, they are arranged in layers with reverse connections to avoid the capacity effect, otherwise obtained. Throughout their range the resistances should be continuously adjustable. The induction coil should be small enough to be worked by a single dry cell, and should not take more than half an ampere in any case. The secondary only requires a comparatively few turns, giving, say, 1,000 volts, because higher E.M.F.'s introduce disturbing effects. The spring of the coil should give a vibration of 250 to 1,000 per second, so that a clear singing treble tone is obtained. An ordinary telephone can be used of resistance about 10 ohms. In operation the electrolyte should be raised to the desired temperature, and balance obtained by sliding the moving contact along the bridge until the minimum sound is heard in the telephone. The resistance of the bath *W* is then found by

$$W = R \times \frac{\text{length } cd}{\text{length } bc}$$

where *b* and *d* are the resistance and bath-end points respectively of the bridge, *c* the moving point, and *R* the fixed resistance. From this the specific ohmic resistance can be obtained, knowing the dimensions of the bath used.

The second award (5s.) is made to "NEMO," whose reply in slightly abridged form is given below:—

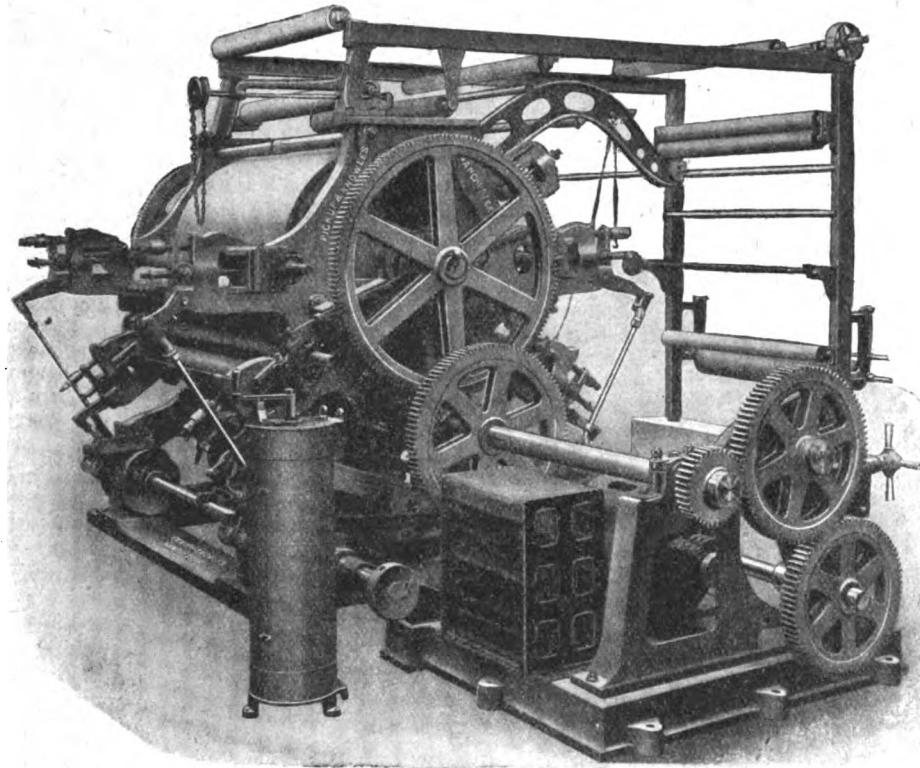

Ordinary Wheatstone-bridge arrangements are not available for this purpose owing to the back E.M.F. occasioned by electrolysis. To obviate this, alternating currents may be employed. Several A.C. testing outfits are on the market. A convenient arrangement is the portable Siemens slide-wire bridge with induction coil and self-contained dry battery, a telephone being supplied instead of a galvanometer for balancing purposes. Or an ordinary post-office box may be used, low-voltage alternating current being supplied through, say, a transformer and choking coil. If the leads from the box to the electrolyte are appreciable compared to that of the electrolyte, their resistance must be measured independently and subtracted. For very low resistances a modification of the ampere voltmeter (fall of potential) method may be employed. A considerable alternating current is passed through the electrolyte, care being taken not to cause heating, and the drop in millivolts is measured on a D.C. instrument fed from a vacuum thermo-couple shunted across the electrolyte, the shunt current giving the heating effect. This is calibrated to read potential difference in A.C. volts. Several measurements should be taken, and the specific resistance calculated by multiplying the observed value of the resistance by the cross-section of liquid or area of plates facing liquid, and dividing by the distance between the plates. Several electrodes may be employed and the results compared.

Electric Light Switching Competition.—The competition held by Messrs. A. P. Lundberg & Sons in our columns in November last is to be followed by another during May in the pages of our contemporary, *Electricity*.

Electric Vehicles.—At the last meeting of the Electric Vehicle Committee it was pointed out, in connection with the restriction of expenditure on publicity of many electricity undertakings under present conditions, that as the electric-vehicle load was entirely of an "off-peak" nature, their adoption would not necessarily entail extensions of plant, and it was urged that endeavours should still be made to make known the advantages of electric vehicles. Efforts are being made to persuade the undertakings in the metropolitan area who charge more than 1d. per unit for charging to reduce their charges. The importance of all vehicles being fitted with the standard charging plug is being urged. The committee has adopted 12 volts as the standard pressure for vehicle lamps, the lamps to be in accordance with the Engineering Standards Committee's specification No. 69. The committee's report on battery-charging equipments is nearly ready.

ELECTRICALLY DRIVEN CLOTH PRINTING MACHINES

AN interesting example of the electric drive as applied to the printing industry is shown in the accompanying illustration. The machine is a six-colour cloth printing machine arranged to print squares or rectangles with side and

ELECTRICALLY-DRIVEN SIX-COLOUR CLOTH PRINTING MACHINE.

cross borders in any length from one yard to ten yards increasing by one inch, and using rollers 18 in. in circumference. The machine is driven by a 25-h.p. three-phase "Witton" motor, the controller resistance being mounted on the bedplate of the machine. As will be observed, the motor is completely out of the way, and the illustration gives a good idea of the compactness of the electric drive. The electrical equipment was supplied by the General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.).

THE B.E.A.M.A. JOURNAL

THE second number of this quarterly has just appeared. Among the articles it contains are "German Kartells : Part II.," "Toward a National Policy for Industry," "Export Business to India," two excellent popularly-written articles on "Illuminating Engineering" and "Motor Control," by Mr. F. W. Willcox and Mr. Frank Walker respectively, and the all-important section, "The Work of the B.E.A.M.A.," which is placed near the end instead of at the beginning.

In this section, mention is made of a second edition of the Association's "Conditions of Sale," with six appendices relating to "tolerance," penalty, bonus and rejection limits, tests, guarantees, speed limitations, &c.; a cryptic note on "cross-tendering" excites curiosity; the position with regard to Canadian business and the "National Electric Code" is commented upon; and the publication of the second edition of the B.E.A.M.A. handbook, which supplements the E.S.C.'s British Standards for Electrical Machinery, is announced.

The value of the *Journal* would be greatly enhanced if this report of the work of the Association were more specific in character. The journal of a great association should do a little more than say that agreements, conventions, and standards relating to this, that, and the other have been arrived at "with much labour"; it should say definitely what the new agreements, conventions, and standards are, and explain why they have been chosen. To judge by the polyglot nature of the advertisements, the publication is intended chiefly for export, and the oversea buyer will hardly be

encouraged by being told that new conditions of sale and standards have been adopted by British manufacturers, while he is left quite in ignorance as to their true significance. For years past Consular reports from all parts of the world have reiterated the complaint that the British manufacturer has lost ground by placing himself on a pedestal and refusing to identify his interests with those of his potential customers abroad. It should be one of the duties of the B.E.A.M.A.

to break down these old-fashioned methods, which have done so much to help the foreigner to capture our export trade, but the inference to be drawn from these notes in the *Journal* is that the methods of the British manufacturer are becoming more and more inflexible, and his "take it or leave it" attitude accentuated. It has been revealed over and over again that the British manufacturer has lost ground in the past from his lack of adaptability. Recent events have proved, however, that he can adapt himself rapidly and effectively to new conditions, but a perusal of these pages of the *B.E.A.M.A. Journal* certainly tends to convey the opposite impression.

The war has taught most of us to see things in better perspective, but the B.E.A.M.A., if we had only to judge by this section of its *Journal*, might be either afflicted with near-sightedness or incommoded with blinkers.

ELECTRIC TRACTION NOTES

The engineering and mechanical workers on the District, London Electric, Central London, and City & South London Railways have been granted their demands for a permanent increase of 3s. per week in substitution for a war bonus of 2s. per week recently granted. As in the case of the wiremen employed on the Port of London ships, these men had threatened to strike within the next week unless their demands were granted.

In consequence of an objection by the Commissioner of Police, and also because of the impossibility at present of obtaining further trailer cars from the manufacturers, Clause 23 of the L.C.C. (Tramways & Improvements) Bill this year, which sought to enable the Council to run trailer and coupled cars on its northern tramway system, has been withdrawn.

The Highways Committee of the L.C.C. has decided, subject to the approval of H.M. Treasury, to adopt the following periods for repayment of capital expenditure involved by the substitution of turbines for reciprocating engines at the Greenwich power station:—(i) Expenditure on river works, foundations for new machinery, and alterations to buildings (added value as distinct from cost of substitution of new work for work destroyed) to be repaid within sixty years; (ii) expenditure on new plant and machinery (other than additional steam, exhaust, feed condenser, &c., pipes) to be repaid within fifteen years, on the understanding that, in the event of payments on the agreed basis being made into the renewals fund at any future date, the question of the period for repayment shall be reviewed; (iii) expenditure on additional steam, exhaust, feed condenser, &c., pipes to be repaid within twenty-five years; (iv) cost (recurring every five or seven years) of re-blading turbines and re-winding generators to be charged to revenue or renewals fund; (v) obsolete capital expenditure to be repaid within three years from the time that the whole of the old plant is displaced.

CATALOGUES, PAMPHLETS, &c., RECEIVED

SWITCHES.—A new edition from A. P. Lundberg & Sons (477 to 489 Liverpool Road, N.) of their catalogue of "Pivot" single-way and two-way tumbler switches contains particulars of the latest forms of these switches in the surface and flush patterns, with ordinary and Admiralty pattern terminals with or without locking devices for the covers, and other modifications. An important point about the movement of these switches is the independent "off" motion, according to which the speed of the break is not determined by the operator.

CONDENSING PLANT.—An interesting illustrated pamphlet from the Contraflo Condenser & Kinetic Air Pump Co., Ltd. (3 Central Buildings, Westminster, S.W.), describes with the aid of photographs of actual installations the principal features of the Contraflo kinetic system of condensing and air pump plant, with which very high condenser efficiencies can be obtained.

CONTINUOUS-CURRENT MOTORS.—A descriptive list from the British Thomson-Houston Co., Ltd. (Rugby), deals with their latest pattern of continuous-current motors, ranging from 0·15 to 10 h.p. These are made in the protected, enclosed ventilated, drip-proof, pipe ventilated, and totally enclosed types, and a very convenient method of ascertaining the most suitable speeds and pulley diameter for any given case by means of curves is employed.

IRONCLAD SWITCHES AND FUSES.—The Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex, and 123-125 Queen Victoria Street), have issued a new leaflet giving particulars of "Foolproof" quick make and break ironclad switches and switchfuses. These articles have been considerably reduced in price, a fact of interest in view of the large amount of new machinery now being installed by manufacturers executing war contracts.

POCKET LAMPS, &c.—The latest list of the products of the New British Ever Ready Co., Ltd. (Hercules Place, Holloway, N.), contains a very large variety of patterns of hand lamps, pocket lamps, torches, &c., supplied by dry cells, as well as illuminated ceiling and other clocks, portable bell sets, &c.

ELECTRICAL SUPPLIES.—Leaflets from Donovan and Co. (47 Cornwall Street, Birmingham) give particulars of "Barwick" British-made motor starters, carbon filament lamps, and other electrical supplies.

Lundberg's Switching Competition.—A little leaflet has been issued by A. P. Lundberg and Sons (477-489 Liverpool Road, N.) containing extracts from letters from candidates in these competitions expressing great appreciation of their utility.

"Witton" Explosion-proof Switchgear.—In addition to an extensive application in fiery mines, "Witton" explosion-proof motors and switchgears are occasionally put to service in a number of unusual circumstances. Gunpowder factories are one of the many works fitted with this class of motor in the normal routine, but a curious application has been found in a hydrogen factory, where it was specified that the switchgear should be explosion-proof in order to guard against explosions due to gas leakages. The General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.), supplied the switchgear for this installation.

Electric Vehicles.—Mr. R. J. Mitchell, in a lecture recently before the Junior Institution of Engineers, referred to the progress made by electric vehicles in the United States, where over 75,000 were in use, and said that improvements had been such that the modern electric vehicle would remain an exceedingly useful machine, were it not improved for the next twenty years. He enlarged upon the advantages of electric over petrol vehicles, especially from the points of view of economy and repairs. The modern accumulator, he said, had reached the point of being entirely dependable, and in the case of the Edison all-steel alkaline accumulator, a guarantee of four years, enabling the user to depend on at least one hundred thousand miles' service, was available.

Motor-car Head Lamps.—Looking forward to the time when motor-car head lights are allowed to be used more generally again, the General Electric Co., Ltd., have introduced a system in which a pair of head lamps fitted with 10 c.p. lamps are supplied by a small dynamo worked by a friction drive off the engine flywheel entirely without accumulators. The machine is put in and out of action by a Bowden wire arrangement. In view of the fact that the head lights are only really required when the engine is running, the system, owing to its simplicity, has much to recommend it in cases where it is desired to have only the head lamps electrically illuminated, and the use of oil lamps for the side, back, and any other lights is not objected to. The machine gives a remarkably constant voltage over a wide range of engine speed. A still smaller size is made with 6 c.p. lamps for light cars.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Aldershot.—The Council recently applied for a loan of £8,500 for extensions, which they consider it is absolutely necessary to carry out. The L.G.B., however, has refused to sanction any amount except that wanted to meet war requirements. The latter has been referred to the Electricity Committee to deal with, as there is a feeling that the whole amount should be pressed for.

Australia.—Four 250-k.v.a. three-phase transformers; also 9,680 yards of 0·05 sq. in. three-core lead-covered cable. Messrs. McIlwraith, McEacharn & Co., Biliter Square Buildings, E.C. May 18th.

Turbine-driven boiler feed pump; for mechanically-fired water-tube boilers and two circulating pumps. Messrs. McIlwraith, McEacharn & Co., Biliter Square Buildings, E.C. June 15th.

The Victorian Railway Commissioners require recording apparatus for checking the consumption of electrical energy in train operation. Full particulars should be sent to the Agent-General for Victoria, Melbourne Place, Strand W.C., not later than May 19th.

The Melbourne Deputy Postmaster-General requires 8 miles of paper-insulated lead-covered cable. June 1st.

Barnsley.—The Borough Electrical Engineer has prepared a scheme of extensions at the power station, and also to the mains.

Bolton.—A L.G.B. inquiry was held last week concerning a loan of £45,032 for the electrical undertaking. The Inspector, Mr. H. Shelford Bidwell, mentioned that the Board was not very much disposed to grant sanction to this loan. The Town Clerk replied that the Corporation had suspended other works to the extent of about £275,000, and this, he thought, showed their desire to comply with the requirements of the Treasury. Of the loan now asked for, £28,032 was for converter plant for the new power station, and the remainder for equipment of sub-stations on consumers' premises, and mains.

Dover.—A L.G.B. inquiry was held last week concerning a loan of £6,000 for a 1,000-kw. turbo-alternator. The Inspector, Mr. H. Shelford Bidwell, said that the amount would have to be reduced by £1,000, as this apparently dealt with private consumers. The Borough Electrical Engineer said that the plant was necessary, as the Department was supplying firms engaged on war contracts.

Johannesburg.—200-ampere circuit-breakers. Further particulars at 73 Basinghall Street, E.C.

Wiring

London: L.C.C.—250 lighting points at the Sebon Street School, Islington. May 12th. (See advertisement on another page.)

Southampton.—Lighting of Men's Home at the Workhouse. Clerk. May 5th.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Aberdeen.—New baths (£2,000).

Coventry.—School in Folly Lane.

Dunfermline.—School at Rosyth (£16,000).

East Ham.—School, Dersingham Avenue.

Wigan.—New public hall. Architect, R. Pennington.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Belfast.—A contract has been placed with Siemens Bros. Dynamo Works for a twelve months' supply of carbon filament lamps for the Corporation tramways.

London: L.C.C.—The following tenders have been received for cables in connection with an additional temporary supply of power up to 3,500 kw. to be obtained from the London Electric Supply Corporation:—Western Electric Co. (accepted), £6,214; British Insulated & Helsby Cables, Ltd.,

£6,298; W. T. Henley's Telegraph Works, Ltd., £6,407 19s.; Johnson & Phillips, £6,696 8s.; W. T. Glover & Co., £6,742 18s.; Siemens Bros, & Co., £6,798 17s.; Callender's Cable & Construction Co., £6,833 2s.

Mansfield.—A loan of £2,000 is to be taken up for transforming and converting plant to supply current to the Clipstone Camp. The cost of the necessary main is to be paid for out of reserve.

Contracts have been received by Venner & Co. for Chamberlain & Hookham meters from the Cardiff, Grimsby, and Hornsey Corporations.

Messrs. Scholey & Co. have received contracts for the supply of tool-steel gears and pinions from the Croydon Corporation Tramways Department, and large orders have recently been received from the Oerlikon Co. (L. & N.W. Railway electrification), L.B. & S.C. Railway, East Ham Corporation Tramways, Pretoria Corporation, Colombo Electric Tramways & Lighting Co., Johannesburg Corporation, and the Auckland Electric Tramways Co.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £87 to £88 (last week, £81 10s. to £82 10s.).

Agencies.—A merchant in Copenhagen desires to secure the agencies of British manufacturers of electrical fittings of all kinds, dynamos, small motors, and meters; and a Brisbane firm desires to represent British manufacturers of electric cranes. Further particulars in both cases at 73 Basinghall Street, E.C.

Change of Telegraphic Address.—The telegraphic address of the Westminster Tool & Electric Co. (Suffield House, Laurence Pountney Hill, Cannon Street, E.C.) has been changed to Westoleco—Cannon, London.

Change of Address.—The British Electric Transformer Co., Ltd., have closed their offices and showrooms in Charing Cross Road. All communications should be sent to Hayes, Middlesex. (Telegrams: Transfundo, Hayes, Middlesex. Telephones: Ealing 226 and Southall 101.)

Cooking Apparatus.—The Armorduct Mfg. Co., Ltd. (Farringdon Avenue, E.C.), announce that owing to rearrangements at their works at Witton (Birmingham) they have discontinued the manufacture of Mr. Napier Prentice's "Lightning" cooker, for which they held the sole licence.

Kinglite Candle Lamps.—The Kinglite Co., Ltd. (Pyke House, 19, 21, 23 Oxford Street, and Soho Square, W.), have disposed of their business in electrical accessories and silk shades to the Edison & Swan United Electric Light Co., Ltd. Practically the whole staff have been transferred to Ponders End, and Mr. W. J. Owen, Managing Director, has accepted a position with the Edison & Swan Co., and will continue to superintend the business he has been instrumental in establishing.

LOCAL NOTES

Belfast: Electricity Works Reorganisation.—The proposal to appoint a Special Committee to inquire into the administration of the electricity undertaking, as mentioned on p. 180 of our last issue, has been passed by the Corporation.

Bury: "Electricity at the Pit's Mouth."—The Electricity Committee report that during excavations in connection with the extensions at the Chamber Hall power house, a coal seam was struck, and that a number of tons of coal had been obtained which have been used at the works.

Hull: Suspension of Capital Expenditure.—The Deputy Electrical Engineer has reported that, in accordance with the instructions of the L.G.B., all capital expenditure on mains, services, and motors on hire ceased temporarily as from March 31st. He suggests, however, that it would be undesirable to cease connecting up new services, and recommends that this is to be continued out of revenue.

London: L.C.C.: Pressure-testing Stations.—The Highways Committee reports that of the 154 pressure-testing stations requisitioned by the Council from the various electric supply authorities in the County of London, 114 had been established up to December 31st, 1914. Stations are now in operation in each area of supply in the County with the exception of the areas of the Chelsea Electricity Supply Co. and the St. Pancras Borough Council, in respect of which the Council's inspectors have no jurisdiction. The position generally is regarded as satisfactory, and the Committee does not consider the present time opportune for the establishment of the full number of stations.

Manchester: Electricity Charges.—It is anticipated that a slight revision of charges for electric supply will have to be made in view of the increased cost of coal. The Electricity Committee proposes to contribute the usual sum of £30,000 during the coming year from electricity profits to relief of rates. The total net surplus for the year to March 31st was £35,850, against an estimate of £30,500. The cost of the war allowances to the employees at the front to March 31st was £6,015.

Stafford: Control of Electricity and Gas Undertakings.—A proposal that the control of the electricity and gas undertakings should be placed in the hands of separate committees has been negatived by the Council. It was pointed out, in the course of the discussion, that there is only one other place in the United Kingdom where the electricity and gas undertakings are controlled by one committee, viz., Alloa, in Scotland.

APPOINTMENTS AND PERSONAL NOTES

A switchboard attendant is required by the Lincoln Corporation. (See an advertisement on another page.)

Wiremen are required by John Brown & Co. (See an advertisement on another page.)

The B.E.A.M.A.—The following firms have recently been elected members of the B.E.A.M.A.:—The Mirrlees Watson Co., Ltd.; John Musgrave & Sons (1913), Ltd.; Newton Brothers (Derby), Ltd.; Isaac Storey & Sons, Ltd. (Branch of United Brassfounders & Engineers, Ltd.).

Diesel Engine Users' Association.—At a recent meeting of the Diesel Engine Users' Association, a standard policy for insurance of Diesel engines at Lloyd's against breakdown was approved and adopted. This includes advantageous terms to members of the Association, and arrangements for periodic inspections of the plant by special experts. A discussion on the lubrication of Diesel engines was opened by Mr. H. L. Alderton (Guildford), who described the various methods of lubrication employed, and emphasised the importance of selecting the best oil for cylinder lubrication to avoid troubles from carbonisation and gumming. Large engines required more oil in proportion to their output than do the smaller engines. In the further discussion it was shown that practice varied considerably in regard to the use of one or several oils with Diesel engines. In some cases one class of oil is used throughout the engine, and in others different oils for the bearings, cylinders, and compressors. The methods of filtration of oil also showed a considerable variation. It was decided to ask for returns from members giving information as to the methods of lubrication employed, with quantities and costs, with a view to further discussion on the whole subject of lubrication at a subsequent meeting. The next meeting will be on Wednesday, May 19th. Information and particulars concerning the Association can be obtained from the Acting Hon. Secretary, Mr. Percy Still, at 19 Cadogan Gardens, London, S.W.

SUMMARY

A FURTHER article on the Electrical Emergency Service appears on p. 192.

MR. DICKINSON's paper on the Bombay Hydro-electric scheme was discussed at the London meeting of the Institution of Electrical Engineers last Thursday (p. 193).

A NEW method of lift control in which an attendant in the car is not required has been adopted at some of the stations of the London Underground Railways (p. 193).

A NATIONAL conference of representatives of the Electric Supply and Gas interests will be held to-day at the Institution of Electrical Engineers to discuss the coal crisis (p. 194).

A SIMPLE indicator, to test whether faults on a tramway line persist, without replacing the circuit-breaker, is described by Mr. G. G. Braid of the Glasgow tramways (p. 194).

THE paper by Mr. J. H. Rider on the use of electric power at one of the large groups of South African gold mines, read recently at the Institution of Electrical Engineers, and also before some of the Local Sections described a scheme as large as the supply of the whole of London and included many points of interest in connection with the large three-phase and Ward-Leonard electric winders employed, the drive of the stamps, tube mills, pumps and air compressors as well as the arrangements for distributing and metering the supply from the power company (p. 195).

FURTHER experiments on the safety of colliery-bell

signalling have been conducted by Dr. R. V. Wheeler, of the Home Office, who finds that bells may be constructed with a sufficiently low self-induction to render the break spark on the bare wires innocuous (p. 197).

THREE further electric miners safety lamps have been approved by the Home Office (p. 197).

Two patent specifications relating to electric furnaces have been published during April (p. 197).

A THREE-PHASE winding plant employing a new type of liquid controller has been installed at a colliery in the Midlands (p. 198).

THE design of porcelain insulators for heating coils is dealt with in our "Questions and Answers" columns (p. 199).

THE case for A.C. motors for foundry crane work was discussed in a paper recently read by Mr. R. H. McBain before the American Institute of Electrical Engineers (p. 199).

AMONG the subjects of Specifications published by the Patent Office last Thursday are electric water-heaters, arc lamp carbons, and power factor regulation (p. 200).

MAINS, services, transformers and switchgear are required at Haslingden; two 12,000-kw. turbo-alternators at Sydney; mains, services, and meters at Battersea and Stepney; rotary converter and switchboard panel at Leigh (Lancs); and switchboard extension at Coventry (p. 201).

THE clerical staff in the Aberdeen Electricity Department are being trained as switchboard attendants.—Increases in tariffs are to be made at Manchester and elsewhere.—The reorganisation scheme at Belfast is again in abeyance (p. 202).

SATISFACTORY results of 1914 are shown by the accounts of the B.T.-H. Co., Willans & Robinson, and the South Wales Electrical Power Distribution Co. (p. 202).

Arrangements for the Week.—Friday, May 7th.—Junior Institution of Engineers, 39 Victoria Street, S.W. Informal discussion. 8 p.m.

Royal Institution. Evening discourse. "Electrons and Heat," by Prof. O. W. Richardson. 9 p.m.

Saturday, May 8th.—Afternoon lecture, II.: "Photo-Electricity," by Prof. J. A. Fleming, F.R.S. 3 p.m.

Association of Mining Electrical Engineers. Joint meeting with National Association of Colliery Managers, University College, Nottingham. "Protective Devices," by E. K. Scott. 3.30 p.m. (Postponed from April 24th.)

Tuesday, May 11th.—Society of Engineers, at Victoria Embankment. "Some Future Developments in Heating and Ventilation," by A. H. Barker. 7.30 p.m.

Wednesday, May 12th.—Institution of Electrical Engineers, Yorkshire Section, Philosophical Hall, Leeds. Annual General Meeting. "The Power Supply of the Central—Mining—Rand Mines Group," by J. H. Rider. 7.30 p.m.

Thursday, May 13th.—Iron and Steel Institute, at Institution of Civil Engineers. Annual Meeting. 10.30 a.m.

Friday, May 14th.—Iron and Steel Institute. Annual Meeting. 10.30 a.m.

THE ELECTRICAL EMERGENCY SERVICE

THREE are still many young men, keen and anxious to join the Army, who are being kept at home and obliged to continue their duties as switch-board attendants until other men who are unable to go away and fight can be found to fill their places. At the moment, we are devoting our attention particularly to London, where some hundreds of men will be wanted to give full time or part-time work to enable these to go.

Applications continue to come in, and we have enrolled many members in the "Electrical Emergency Service"; several are now already on duty at sub-stations in various parts of London, but very many more are wanted. Some of our readers have placed themselves at our disposal for full shifts, and have been placed on duty with very little delay, but the greatest number of offers have been for half-shifts (averaging four hours) for alternate nights. To release each man, four half-shifts on alternate nights are of course required, and for working half-shifts in the midnight hours, it is obvious that the volunteers must be men living near the stations or sub-stations. Some of the people on our register are still unplaced, owing to there being no call at present in the particular district in which they reside, but others are living in districts in which their services are required but are being kept waiting for more enrolments in order that the groups of four may be made up. We want *every* electrical engineer in London who will give four hours a day, or four hours on alternate nights, to become enrolled, and we want them most urgently in the following districts: Hammersmith, Wandsworth, Tooting, Streatham, Clapham, Stockwell, Battersea, Camberwell, Holborn, Camden Town, Islington, Mildmay Park, Clapton, Hackney, Limehouse, Barking, Poplar, Woolwich, Lewisham and Forest Hill. Although this list is a long one, it by no means represents the whole of the requirements; but in these districts the demand for assistance is being acutely felt.

Moreover, it is the *good* men we most want: for instance, men over military age who have filled or are filling good positions in the electrical profession, who have arrived at the stage when they might normally take things a little easier after the strenuous life which this profession always imposes on its devotees,

but who are willing now to defer their rest a little longer in view of the national emergency. Many such men are making excellent special constables, some have already enrolled themselves in the Electrical Emergency Service, and there will, we hope, be many more who will do so when they read this appeal.

The following Engineers and Managers of electricity works, &c., in Greater London have expressed their approval of the Electrical Emergency Service:—Mr. Sydney W. Baynes (St. Pancras), Mr. A. W. Blake (Willesden), Mr. J. H. Bowden (Poplar), Mr. E. Calvert (Finchley), Mr. A. C. Cramb (Croydon), Mr. C. S. Davidson (Barnes), Mr. A. L. C. Fell (L.C.C. Trams.), Mr. Herbert Jones (Waterloo—City and L. & S.W. Rly.), Mr. G. W. Keats (Woolwich), Mr. W. E. Kidner (Acting Engineer and Manager, Barking), Mr. J. D. Knight (Ealing), Mr. W. E. J. Heenan (Bermondsey), Mr. A. V. Mason (South Met. Elec. Trams and Ltg.), Mr. G. W. Partridge (London Electric Supply Corp.), Mr. G. M. Powell (Smithfield Markets Electric Supply Co.), Mr. L. L. Robinson (Hackney), Mr. E. T. Ruthven-Murray (North Metropolitan Electric Power Supply Co.), Mr. Roger T. Smith (G.W. Rly.), Mr. C. P. Sparks (County of London Co.), Mr. H. W. Sprunt (South London Electric Supply Corporation), Mr. G. R. Spurr (Walthamstow), Mr. H. P. Stokes (Bexley), Mr. J. E. Tapper (Beckenham), Mr. W. C. P. Tapper (Stepney), Mr. H. Tomlinson-Lee (Wimbledon).

[By an unfortunate printers' error last week, Mr. Roger Smith was given as S.W. Rly., instead of G.W. Rly., and Mr. Sparks' name was wrongly spelt.]

Applications for enrolment, on the form below, should be sent to the Editor of ELECTRICAL ENGINEERING, 203 Temple Chambers, London, E.C., who will be pleased to reply to any inquiries for further information, and from whom also further application forms may be obtained.

The Service Required.

- A. A full eight-hour shift a day, or—
- B. A half-shift (four hours) daily (1st week morning, 2nd week afternoon, 3rd week night, in rotation).
- C. A half-shift every day, without midnight work.
- D. A half-shift alternate nights with no day work.

To prevent any suggestion of competition with regular employees, wages will be paid in proportion to the existing rates at the works at which the member is employed, and to the time given.

A week's notice will be required from any member leaving the Service.

APPLICATION FORM.

(Please cut out, fill in, and return to the Editor of "Electrical Engineering," 203 Temple Chambers, London, E.C.)

I wish to be enrolled as Member of the Electrical Emergency Service.

Age.....

Married or Unmarried.....

Qualifications (state electrical experience)

.....
.....
.....

I am willing to work a full shift as (A) (above),

a half shift as (B), (C), (D).

(Delete the line and letters not applicable.)

My regular occupation prevents me at present from giving electrical emergency service between.....a.m. and.....p.m.

Signature

(Please write very
distinctly, and give
addresses very fully.)

THE BOMBAY HYDRO-ELECTRIC SCHEME

MR. R. A. DICKINSON'S Paper dealing with the Bombay Hydro-Electric Power Scheme, of which an abstract was given on p. 188 of last week's ELECTRICAL ENGINEERING, was read before the Institution of Electrical Engineers in London on Thursday. At the conclusion of reading the Paper, Mr. Dickinson showed a number of photographs of the works in progress, which brought home to the members, probably better than the Paper itself did, the magnitude of the scheme undertaken. This was further emphasised when Mr. Dickinson pointed out that the masonry used in the construction of the Shirawat dam is considerably more than that used in the construction of the Assouan dam on the Nile, whilst the Walwhan dam is only a little smaller than the Assouan dam.

MR. ROBERT HAMMOND, who opened the discussion, believed that the fall of 1,725 ft. between the reservoirs and the power house was the largest in any scheme of this nature. He considered that 100,000 volts was a rather high transmission pressure for so short a distance. In America, for transmissions of from 40 to 80 miles voltages varying from 30,000 to 70,000 had been adopted. He also wished to know why suspension insulators had been adopted, and stated that one of the Niagara companies had had considerable trouble with the excessive swinging of this type of insulator, and a special means had been devised to prevent it. Dr. Pearson, who had had much experience of long-distance transmissions, preferred pin insulators even with very much higher voltages than 100,000.

MR. T. O. CALLENDEB referred to the difficulties encountered in carrying out the works, not the least of which was that of labour. Bombay was to be congratulated upon having the scheme, and also upon the manner in which it had backed it up financially.

MR. J. H. RIDER regretted that so much of the plant in the Bombay scheme had not come from Great Britain. As to the line voltage, a great deal of risk was incurred by going too high, and he did not think in this instance the results would have been less economical had a lower pressure been adopted. He commented adversely on the use of belt-driven governors on the turbines. Apparently Mr. Dickinson had no earthing connection on any part of this system. On the Rand it had been found that earthing several places of the system had been most necessary to reduce risks from lightning, and it would be interesting to know why the generator of the neutral point in the Bombay case had been deliberately left unearthing. It appeared also that only one horn lightning arrester was used in series with an aluminium arrester. Had Mr. Dickinson had any experience of the operation of these, and had he found one horn arrester sufficient? On the Rand there were four or five horn arresters in series, and aluminium arresters were not used at all. With regard to the transmission line, he would rather anticipate troubles from corrosion owing to the large surface for moisture to act upon, due to stranded conductors being used. Notwithstanding Mr. Hammond, he thought a suspension type of insulator was the right one. It had been adopted on the Rand, and no trouble had been experienced from the swinging. He would like to know, however, whether six insulators in series were safe for 100,000 volts. On the Rand they were using six in series for a 80,000-volt line, and on a small transmission scheme out there, which he had designed, on 20,000 volts over a distance of 22 miles there were two in series.

DR. E. ZOELLY (Escher, Wyss & Co.), speaking on the question of belt-driven governors, said that all the experience of his firm was that this was the best type. They had frequently had to replace a rigid drive by the belt drive. With rigid drive, mechanical shocks were conveyed to the governing plant and led to trouble.

GENERAL B. LOVETT said this was the first hydro-electric scheme in India to be financed on a commercial basis. Its predecessors were all financed by municipalities. In this case, although the scheme received encouragement from the Government, Mr. Tata did not succeed in raising the necessary funds in London, but was able to obtain the necessary capital in India.

MR. G. B. TWISS thought that the factor of 4 for the towers, although satisfactory in this case, was not a figure which should be taken as a precedent. The insulators used by Dr. Pearson were not really pin insulators, but suspension insulators, one above the other making what might be called a rigid suspension insulator. The Bombay scheme was noteworthy on account of the material for the transmission lines having been wholly manufactured in England.

SIR JOHN McCRAW (Agent-General for New Zealand) referred to a number of power transmission schemes which are being carried out in his colony, and mentioned that those who financed these schemes were sure of receiving the most fair treatment from the Government.

DR. A. H. RAILING pointed out that during the three months of the year sufficient water had to be accumulated to supply 88,000 h.p. for twelve months, and therefore the diversity factor of generation was immense. He considered some of the temperature rises specified rather high considering the overloads allowed for.

MR. G. F. SILLS said there was a scheme in operation in Germany in which 100,000 volts were used for a 45- or 50-mile transmission line. As to the number of insulators, on the 110,000-volt Toronto transmission line they use eight in series, and during four years' working there had only been five hours shut down for the whole 400 miles.

MR. DICKINSON replied briefly to a few of the points raised in the discussion, and promised a fuller reply for the Journal. He went on to say that there was the highest recorded rainfall in the world in the area of the dams, and it had been as high as 540 inches in 90 days. Nevertheless, within three miles of where the 540 inches were recorded, less than 60 inches fell, so that it would be realised what great care was necessary in selecting the sites for the reservoirs. If they had been put two or three miles in different directions there would probably have been no water at all. As showing the care with which this matter had been approached, it was not without interest that one of the deciding factors in the selection of the sites was the existence of certain land crabs, which must have water, and when they were found in great quantities this led to the conclusion that there must be water in this district. The capital of the scheme was divided equally into debentures, preference shares, and ordinary shares. When it was in full working order within two years he did not think he was over sanguine in saying that the ordinary shareholders should receive a 30 per cent. dividend.

IMPROVED LIFT CONTROL ON THE UNDER-GROUND RAILWAYS

A NEW system of lift control, dispensing with the necessity for the presence of an attendant within the car, and providing for external control from the landings, is being adopted at some of the stations of the London Underground Electric Railways. Ten lifts at various stations, including Euston, Great Central, Piccadilly Circus, and others, are already equipped, and a further improved system with the same object is ultimately to be applied to forty-one more lifts. The object of the change is not really to save labour, as unless a group of three or more lifts are being worked together as many attendants are required. Thus two men are still required for two lifts as before, although they are at the top and bottom landings instead of in the cars. This has the advantage of a man being always at hand to deal with passengers' inquiries, and, again, the attendant does not need to wait for the last passenger, as, owing to his being always aware of the position of both cars, the ideal of having one ascending while the other is descending can be more nearly attained. An important part of the system is the depth indicator, which is in the form of a box containing a lamp running vertically on two metal guides, which form the lamp leads, and mechanically driven by the motion of the car. This is mounted over the lift-doors directly above the usual red indicator lamp which, owing to the action of a switch worked by the car through a cam, lights up when the car approaches the landing, and stays alight till the entrance-door is closed.

The control of the air-operated gates and doors in the car and at the landings is now effected from control boxes containing a series of push-buttons or plungers, which control the solenoid-operated air valves admitting compressed air to the cylinders working the gates. One box is provided at the top and one at the bottom of each lift, and these are kept locked when not in use. An additional plunger is also provided, by which the red indicator lamp can be extinguished when it is desired to show which of several lifts standing at the landing will start first. The same control box also contains the push-button by which the lift is actually started, and an emergency stop button. The top landing box has also another button, by which the lift can be started up from the bottom, but this is only used in special circumstances, and is ordinarily kept covered by a metal slide, so that it cannot be worked by mistake. The bottom control box can only be used to start the lift in an upward direction. The gate control is so arranged that the exit car gate and landing door are opened or closed together on pressing the correct plunger, while the entrance car gate and landing door, although opening together, have their solenoid valves interlocked with their limit switches in such a way that the car gate closes first and the door after it without any further operation. This is to enable the attendant to see that the car gate is closed safely. The valves are also interlocked with the starting-control circuits, so that the lift cannot be started unless all gates and doors are closed. The landing doors are also mechanically locked unless the lift is at the landing, and the car gates are prevented from being opened at the wrong time by hand, as they are difficult to move against the

air pressure. As sometimes only one lift is being worked at a time, car control is retained, as only one man is then required. For this purpose a similar box is provided in the car with plungers for working the gates in the same way. Starting is effected by the ordinary controller handle, although the controller itself has been simplified, and only retains two contacts. The emergency stopping switch, which was a feature of the original control, is retained. Another minor alteration is provision of a panel of expanded metal in the car through which the attendants can call to the passengers in the car in case of necessity.

The solenoid valves used for the gate control are of a special type designed for the purpose, of simple construction, and arranged so that the coils and working parts can be withdrawn without breaking any pipe joints. In the perfected form of the apparatus the valves will be integral with the cylinders. The modifications to the main control gear in the motor room over the lift shaft are not very great, although they required some ingenuity in arrangement. They consist mainly in the addition of a rising and falling spindle and disc and the necessary spring contact to convert the electro-magnetically-actuated reversing switches into "stick relays," which hold on once their control circuit is momentarily closed by the starting push-buttons or car-controller. The cars are stopped at the landings as before by the working of the limit switches, and the arrangement of the clapper switches by means of which the automatic acceleration and braking is accomplished is unaltered.

There will be slight differences in detail in the further perfected system referred to above, but these lie more in the design of the items composing the equipment than in the principles on which the control is carried out. We understand that the control gear of the older lifts on the Central London Railway, which works on quite a different method, is also to be rearranged on an improved system. It is thus evident that the company is doing its utmost to make its existing lifts as efficient in their working as possible, although it is unlikely, in view of the success of the escalators now in use at the newer stations, that any further lifts will be put in on future extension work. We wish to express our thanks to the Engineers of the London Electric Railway Co. for permission to inspect and describe this equipment, and particularly to Mr. W. S. Graff-Baker for the trouble he took in explaining the details to our representative.

COAL SUPPLIES AND THE WAR

NOTWITHSTANDING the various conferences with the Board of Trade, the reports of committees, &c., the question of supply of coal to electricity works and other public undertakings is getting even more urgent, and requires most serious consideration by the Government and no loss of time in the taking of remedial measures. The state of affairs in respect of depleted stocks of coal and difficulty in obtaining supplies by rail and sea, together with the abnormal increase in freights and in coal prices for present and future requirements, is most serious, and the situation is being made still worse by the demands for enormous increases in wages by the miners. We are glad to be able to announce therefore that it has been decided to hold a National Conference of representatives of the Gas and Electric Supply Industries for the purpose of considering the best course to adopt for bringing the far-reaching issues involved under the attention of the Government, with a view to some immediate measures of relief being obtained. This Conference will be held in the Lecture Theatre of the Institution of Electrical Engineers (Victoria Embankment) this afternoon at three o'clock.

Some Notes from Germany.—We hear from a Danish correspondent who formerly did much business with Germany, that for the last three or four months practically every machine shop in Germany has been busy turning out war material day and night; and this applies to practically every class of works; for instance, a large telephone factory is busy employed in this way. All the lathes available in Scandinavia have been bought up for Germany, and the large firms are putting in all they can get. Export to Denmark is diminishing week by week, not only for the above reason, but also because the supplies of raw material (especially indiarubber and all metals except zinc) are getting smaller. Electrical goods may only be exported if they do not contain more than a trifle of copper or brass, and prices are about 20 per cent. over normal conditions. The two exceptions are lamps and technical china, which can be obtained at normal prices and quickly—doubtless due to the stoppage of export to Great Britain.

AN INDICATOR FOR DETECTING SHORTS ON TRAMWAY FEEDERS

By George G. Braid, A.M.Inst.C.E.

WHEN a short occurs on a tramway line, the feeder-breaker controlling the section in question opens automatically. As a rule, the only method of determining whether the short is still on the feeder or not is to replace the feeder-breaker, and then, if the feeder-breaker comes out again twice in succession, to presume that the short is due to some permanent defect, such as a breakdown in the overhead trolley-line construction. The repair tower wagon is then sent out to the feeding point so as to locate the exact position and cause of the fault. Now the fault may not be a permanent one; it may be due to the pole of a car getting temporarily entangled with the overhead line, or due to a telephone or other overhead wire falling on to the trolley wires, which might easily be pulled clear in a few minutes. It would then be quite safe for the feeder-breaker to be closed again, and thus as little delay as possible caused to the traffic.

Now it was to enable the attendant in the power station to know when the short was cleared that the writer designed the following short-indicator. The problem was to design an indicator which would distinguish between a low short-resistance of, say, 4 ohms, and a resistance of the nature of

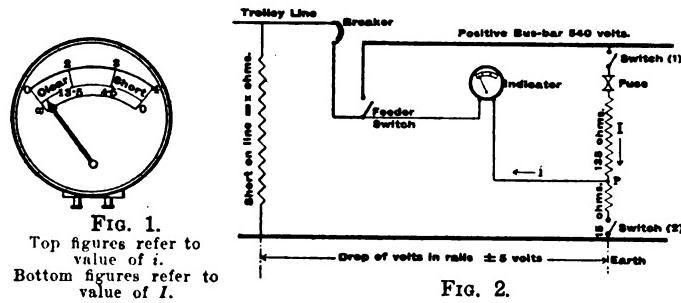

FIG. 1.
Top figures refer to
value of i .
Bottom figures refer to
value of I .

FIG. 2.

14 ohms, due to all the cars on the section having their lamp-circuits switched on. While indicating such low resistances the arrangement must not be so sensitive as to be seriously affected by a voltage of, say, 5 volts (positive or negative) existing in the rails due to the large return currents flowing in them.

The front of the indicator is shown in Fig. 1. When the resistance of the line to earth is above 13.5 ohms, the needle indicates "clear"; when the resistance of the line to earth is less than 4.5 ohms, a "short" is indicated. The principle of action of the instrument is shown in Fig. 2. The instrument itself is really an ammeter reading from 0 to 4 amperes, and combined with the instrument is a resistance of 150 ohms with a tapping at the point P . Table I. gives the values of the current through an indicator for various values of the short-resistance, and also shows the effect of the drop of potential in the rails.

| Resistance of Short to Earth. | Total Resistance R. | Total Current I. | Potential of P. V. | Current through Indicator i. | Maximum Effect of Rail Drop on i. |
|-------------------------------|---------------------|------------------|--------------------|------------------------------|-----------------------------------|
| 0 | 135.00 | 4.00 | 0.0 | 4.00 | ±0.38 |
| 5 | 138.75 | 3.89 | 14.6 | 2.92 | ±0.25 |
| 10 | 141.00 | 3.83 | 23.1 | 2.30 | ±0.20 |
| 15 | 142.50 | 3.79 | 28.4 | 1.90 | ±0.17 |
| > 15 | > 142.5, < 150 | < 3.79, > 3.60 | > 28.4, < 54.0 | < 1.90 | ±0.17 |
| ∞ | 150.00 | 3.60 | 54.0 | 0.00 | ±0.00 |

Whenever a short occurs, bringing out a breaker, the indicator is immediately connected up as shown in Fig. 2. Switches 1 and 2 are then closed. Of course, so long as the controllers of the cars are "on," an apparent short is indicated, but as the drivers will only put them on to try if the power is on, and then switch them off again, no permanent short will be indicated in this way. If the indicator shows "clear," it is best first to open switch 2 for a moment so as to throw a considerable voltage on to the line in case the fault is due to a guard or other wire hanging down and lying lightly against the trolley wire and making bad contact. As a rule, whenever switch 2 is opened, the guard wire will become partially fused to the trolley wire, and thus a short be immediately indicated whenever 2 is closed again. If, however, the indicator still shows "clear," it may be taken as an indication that it is quite safe to replace the breaker and switch controlling the section.

ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Published on the First Thursday of each month

ELECTRIC POWER IN THE RAND

A LONG and detailed Paper on the power supply of the Central Mining-Rand Mines Group was read by Mr. J. H. Rider at the London meeting of the Institution of Electrical Engineers on April 15th, having been read at Manchester and Birmingham on the two previous nights.

The group of mines in question is supplied with power by the Victoria Falls & Transvaal Power Co. and its associated company, the Rand Mines Power Supply Co., whose power stations at Rossherville and Vereeniging, were described in Mr. A. E. Hadley's Paper before the Institution in March, 1913 (see ELECTRICAL ENGINEERING, Vol. IX., p. 159, March 20th, 1913). The mines are thirteen in number, under control of the Central Mining & Investment Co. (formerly H. Eckstein & Co.) and Rand Mines, Ltd., and produce about 14·5 per cent. of the total gold output of the world's crushing, nearly nine million tons of ore per annum. A part of the power supply is in the form of compressed air from the Robinson Central Deep compressing station (also described in Mr. Hadley's Paper). The supply of power was started under the present contracts in 1911, and during the first three years some degree of trouble and interruptions were experienced until the full amount (25 per cent.) of reserve plant was available. It has been found that the maximum individual demands of the mines have a diversity factor of about 1·14, and the annual consumption is about 310 million units, with a maximum demand of 47,300 kw., or a load factor of about 75 per cent. The supply is furnished nominally at 2,100 and 525 volts 50 cycles three-phase, but the contract allows of a pressure variation of 10 per cent. up and down, and a frequency variation of 5 per cent. up and down before damages become due. Transforming plant is provided at each mine by the Power Co., who are bound to keep a spare transformer at each of the twenty-three points of supply. The capacity of the transformer stations aggregates 125,750 k.v.a. The electric supply is metered at each point of delivery by three meters in series—one meter is the property of the Power Co., another of the consumer, and the third is jointly owned and maintained. Normally the mean of the three is taken, but if any one meter reading is 3 per cent. different from the mean, the meter is tested and re-adjusted. The Paper also describes the means adopted for metering the compressed air supply.

The number of motors installed is 1,500, varying in size from 2 to 2,000 h.p., aggregating 142,300 h.p. Among the various uses, winding includes 57,340 h.p.; pumps, 30,330 h.p.; stamps, 13,800 h.p.; compressors, 11,700 h.p.; and tube mills, 10,170 h.p., distributed over the various mines. The electric winders are sixty-nine in number, fifteen underground and the rest on the surface. The nine largest are on the Ward-Leonard system, and the remainder three-phase. The deepest vertical shaft is 4,144 ft., and there are some inclined shafts of great length. A considerable proportion of the winders are old steam winders, with their connecting rods removed and motors connected up, and the three-phase system was largely adopted by those originally responsible on the score of saving in capital expenditure—a policy questioned by the author of the Paper. He admits that the three-phase control gear is simpler, but its handling is more arduous and less easy than that of the Ward-Leonard system. Again, the latter system is much more economical in working, in that braking requires no energy from the line, and will even return energy to the line, whereas with a three-phase winder, electric braking can practically only be obtained by using either reverse current or an auxiliary braking machine. Some of the winders are fitted with eddy-current brakes, each consisting of a field magnet system, exactly similar to that of a low-speed alternator, revolving within a hollow water-cooled cast-iron stator ring, with a smooth face. These are excited by motor-generators with field control. These brakes can lower an unbalanced load of 9,000 lb. at a speed of 250 ft. per minute with an expenditure of 45 kw. An equivalent result could only be attained by applying reverse current to the winding motor with an expenditure of 1,600 kw. These eddy-current brakes, however, bring the cost of the

equipment practically up to that of the Ward-Leonard system. Reverse-current braking is used on some of the three-phase winders, but it was not until after considerable experiment that satisfactory control gear was evolved.

The three-phase winders were originally controlled by liquid rheostats of German make of the variable weir type, with the liquid constantly circulated by a pump, but these gave considerable trouble in flashing over between electrodes and in other ways, and were afterwards replaced by metallic resistances controlled by a contactor system giving automatic acceleration control, and with contactor switches also in the stator circuits. This gear, which was supplied by the General Electric Co. of America, gave great satisfaction in ease of control, freedom from possibility of flashing over, and lower resistance in the full-load position. The only changes that were found necessary in this apparatus was its re-erection on a more substantial framework, and the substitution for the original cast-iron grids under water of a series of air-cooled rods or tubes for the main portion of the motor resistance, and three iron plates in water for the remainder. The contactors for the stator circuits have arcing horns and magnetic blow-outs, and are much better adapted to the very frequent operation required than oil switches, and have been recorded to have made and broken the stator circuits over 388,000 times without any cost for repairs or maintenance. It is stated generally that the deeper the shaft, the cheaper is the three-phase system relating to the Ward-Leonard system up to the point where the weight of the descending rope balances the ascending load, and reverse current has to be applied to prevent the winder running away. The largest winder on the system, and indeed the largest in South Africa, is of the Ward-Leonard type, with two motors rated at 2,000 h.p. direct coupled to 22-ft. drums, and capable of raising a net load of 16,000 lb. from a depth of 3,540 ft. at 3,500 ft. per minute.

The conditions of winding are somewhat different from those obtaining in coal mines, and there is very little headroom above the point where the skips in which the ore is raised are tipped. Experience has shown, however, that most of the so-called over-winding accidents have not been caused by any failure to stop the skip in time, but by starting the wrong direction inadvertently. Overwinding devices which cut off the supply are not of great use in such circumstances, because the driver must retain full control to be able to bring the skip to the exact tipping point. An apparatus devised by Mr. W. Philip (of the Simmer and Jack East Mine) is, however, used, in which suitable contacts are provided on the indicators, control levers, &c., which cause a hooter to sound immediately if the control lever is moved in the wrong direction while the skip is in the danger zone. A special form of dial depth indicator, in which the pointer moves through a very wide angle, covering at least $1\frac{1}{4}$ turns in a circular path of increasing radius. All the electrical instruments and pressure gauges are mounted on the same framework as the indicator dials.

The whole of the pumping is now electrically worked. Originally it was done by steam and compressed air driven pumps in stages until high-lift motor-driven ram pumps were installed. Some of these have now been superseded by multi-stage centrifugal pumps. The most notable installations consist of two eight-stage Sulzer pumps in series coupled on either side of a 500-h.p. motor running at 1,470 r.p.m., and capable of lifting 375 gals. per minute to a height of 2,400 ft. With these pumps a considerable reduction of working costs as against the ram pumps has been experienced, and the use of such plant is being extended. The pump motors at the very lowest levels which are liable to be drowned out will be worked at 200 volts from step-down transformers, and, being of the squirrel-cage type, will have no switchgear between the transformers and the motors. They will be started by star-delta connection of the transformer primaries.

After the ore is tipped into the headgear bins, it is rough-sorted on long picking belts and passed to crushers of the jaw or rotary type, in which it is crushed to pieces in $1\frac{1}{4}$ in. cubes and smaller. A feature in the driving of these crushers is that, owing to dust difficulties, the motors are placed in

separate houses. The ore is then taken to the stamp mills, where it is reduced to finer particles. The rows of stamps consist of weighted rods raised by cams on a shaft running along the row, and are allowed to drop by their own weight. The cam-shafts are driven at 49 r.p.m. by a double-reduction belt drive with jockey pulleys. The power required is about 5 h.p. per stamp. In the older stamps one large motor drives from 80 to 100 stamps, but in the later installation a separate motor is provided for each group of 10 stamps. It is important to note that if the shaft speed increases above a certain value, the uprising cam may meet the descending tappet before it has completed its fall, and a "camming" action will result that may break the shaft. In the earlier days the variation of frequency caused a good deal of trouble due to this cause, which affected all the mills at the same time. It was noticed that the supply was more generally given near the higher limit of frequency, and the drives were altered to suit, as being the lesser evil.

From the stamps, the ore passes to the tube mills, where it is further pulverised. These are cylindrical vessels about 22 ft. long and 5 ft. 6 in. diameter, carried on hollow trunnions and rotated at 28 r.p.m. They take a considerable amount of energy to start, and are very sensitive to over-loading; as many of the motors have burned out from these causes, the original 100-h.p. motors are being replaced by 125 and 150 h.p. machines. After various experiments, the most satisfactory form of drive was found to be a motor running at 585 r.p.m. belted to a pulley on a pinion shaft running at 120 r.p.m. and straight-toothed spur-gearing of 4:3 to 1 ratio.

Certain of the mines which are too far distant from the Power Co.'s compressing station to take compressed air in bulk have their own electrically-driven compressors. Some are converted horizontal steam-driven compressors rope-driven by motors, and with one exception the new direct-coupled compressors are of the Belliss vertical two-stage pattern, some as large as 1,000 h.p. There is also one Parsons turbo-compressor, which compresses air to 7.5 lb. per sq. in., at which pressure the old rope-driven machines complete the compression.

Electric power is also used for underground haulage and locomotives (5,290 h.p.), workshops (2,110 h.p.), ventilating (1,370 h.p.), and other miscellaneous purposes (4,750 h.p.). As a rule, motors up to 50 h.p. are on the 525-volt circuit, and larger ones wound for 2,100 volts. At present squirrel-cage machines are only used below 15 h.p., but their use is being extended to much larger sizes, with auto-transformer starters. The slip-ring motors, as a rule, have liquid starters.

The switchgear which deals with the distribution of the 2,100 and 525 volts has undergone considerable modification from its original form, as, especially from the point of view of safety, it left much to be desired. A proper cubicle system is now employed, and the oil switches, instead of being rated merely on the full-load current of their circuits as formerly, are now all of a standard size rated at 800 amperes at 15,000 volts, whether they are on the 2,100- or 525-volt circuits. Three-core lead-covered cables laid in trenches are used universally between the main switchhouses and the sub-distribution points on each mine.

The latter part of the Paper deals in some detail with causes of trouble due to faults in design and manufacture in some of the plant supplied, and in particular the smallness of the air-gaps and lack of rigidity of the frames of the large three-phase winding motors is mentioned. A minimum radial air-gap of the following value is now demanded for all moderate-speed motors :—

$$\sqrt{d} - 0.25 \text{ mm.}, \text{ where } d = \text{rotor diameter.}$$

An interesting point is the difference in the temperature-rise of machines at the altitude of the Witwatersrand (about 6,000 ft.) compared with sea-level. For this reason it is specified that no part of the motor shall have a temperature-rise exceeding 30° C. on full-load continuous test at sea-level (with an atmospheric temperature of 25° C.), as this corresponds approximately to a temperature-rise of 35° C. at 6,000 ft. altitude (with an atmospheric temperature of 35° C.). Finally, some details are given of the use of compressed air in the mines, which is chiefly used underground for rock drills, small winches, and blowing out the workings after blasting has taken place.

The author concludes with a tribute to the work of his predecessor, Mr. A. M. Robeson, and expresses his thanks amongst others to Mr. E. G. Izod, who succeeded him as Consulting Electrical and Mechanical Engineer to the Central Mining-Rand Mines Group.

The discussion was opened by Mr. A. E. Hadley (Managing Director, Victoria Falls Power Co.), who said that such early

troubles as had been experienced were entirely due to the shortage of spare plant, which had since been remedied. The wide limits of variation of voltage and frequency were accounted for partly by this cause and partly by the nature of the consumers' plant. He paid a high tribute to the way in which Mr. Rider had carried on the negotiations with the Power Company.

Mr. J. Shepherd (L.C.C. Tramways) referred to the enormous size of the undertaking, the power taken by which was greater than the whole of the units generated by the companies and municipalities in London. He asked if Mr. Rider really thought that 25 per cent. reserve plant was sufficient when turbogenerators were employed. The allowable pressure variation of 10 per cent. up or down he regarded as excessive. He questioned whether the three-phase winders were really reliable without the addition of the eddy-current brakes, and submitted that this addition brought their cost nearly up to that of the Ward-Leonard system without the advantage of regeneration of energy. He thought that the control gear in the winding motors described in the Paper appeared rather small for the voltage and for the work it had to do. He was surprised that more trouble had not been experienced from dust. He also suggested that worm driving might have been employed for the tube mills, and asked what was the effect on the heating of the motors of the rarefied nature of the atmosphere due to the altitude.

Mr. C. P. Sparks (Chief Engineer, County of London Electric Supply Co.) observed that for the very largest winders the Ward-Leonard system had been employed, which confirmed his view that there were difficulties in the way of control gear for very large three-phase winders. The contactor system seemed admirable, and among its advantages over the liquid resistance system was the more complete way in which the resistance could be short-circuited. He was inclined to regard the power taken for ventilation rather small, considering the extent of the mine, and enlarged upon the influence of good ventilation on efficiency of labour in mines. He considered the range of variation of pressure and frequency extraordinarily wide. It was evident, however, that they could not have been taken advantage of to any great extent by the Power Company, or so good a load factor could not have been obtained.

Mr. F. V. Hunter (Newcastle-on-Tyne Electric Supply Co.) expressed approval of the standardised oil switches described by the author, and asked if specially strong tanks were employed. He also wished to know whether complete sets of instrument transformers were provided with each of the three meters in each group. He thought that the Paper emphasised the important lesson that on large schemes it did not pay to put in cheap plant.

Mr. Roger T. Smith (Electrical Engineer, Great Western Railway) made some remarks on the system of metering, and pointed out that it was an advantage to have the different meters of different types, so that their errors, especially those due to temperature, might cancel out. He also asked if the drum type of liquid resistance had been tried, and referred to slip rings as being the part of an induction motor which gave most trouble. Contactor control was quite worth while, even with moderate-sized motors, and one of its advantages was the possibility of automatic acceleration. A tube of resistance that might perhaps be used was that composed of iron tubes with water circulating through them.

Dr. A. H. Railing (General Electric Co., Ltd.), in reply to a complaint of the author that manufacturers did not study the requirements of their customers sufficiently, assured him that of late years this had been to a large extent remedied by the employment of trained engineers to do work for which commercial men were formerly considered sufficient. Mr. R. Hammond spoke of the great advantage of the class of load in question owing to its excellent diversity factor, and Mr. L. B. Atkinson made some remarks on the financial part of the undertaking, which provoked a reply from Mr. E. J. Fox. The Chairman, however, ruled that these matters were somewhat outside the scope of the Paper. Another speaker was Mr. J. J. Fasola, who commented on the control gear of the winding plant and other matters.

Mr. Rider, in reply, said that he thought that 25 per cent. reserve plant was quite sufficient, and remarked that most of their troubles had occurred before as much as this had been provided. The three-phase winders with eddy-current brakes had proved quite reliable, since the control gear had been altered. The Ward-Leonard system was always a little more reliable in that it did not depend on its mechanical brakes in the same way in case of failure of supply. There had never been any trouble with those hoists that were specially constructed for electrical working, and the contactor gear had been quite satisfactory in its working, and the dry climate had been in favour of the insulation of all the apparatus. Worm gear was not well adapted to the driving of the tube mills, on account of the amount of end play necessary. In reply to Mr. Sparks' remarks on ventilation, owing to the different nature of the mines and large amount of compressed air used, as much power was not required for the purpose as in coal mines. A complete set of instrument transformers was provided for each meter, but there was not a great difference in the types of meter employed. He had not tried water-cooled tube resistances, but anticipated that they would give trouble in insulating.

THE DANGER OF IGNITION FROM MINING BELLS

THE Home Office has issued a report by Dr. R. V. Wheeler (of the Home Office Experimental Station, Eskmeals) on battery bell signalling systems as regard the danger of ignition of firedamp-air mixtures by the break flash at the signal wires. It will be remembered that Dr. Wheeler made some investigations on this subject in connection with the Senghenydd disaster, which were referred to in the official report (see ELECTRICAL ENGINEERING, Vol. X., p. 251, May 7th, 1914). Further experiments have since been made which had as their object the obtaining of a system of bare wire signalling which would be entirely free from the possibility of ignition.

The new experiments fully confirm the results of the earlier investigation. The most sensitive mixtures of methane and air are found to be those containing from 7·5 to 9·0 per cent. of methane, and the upper and lower limits of inflammability are 5·6 and 14·8 per cent. Experiments made with mixture diluted with nitrogen to represent the conditions often prevalent in mines showed that the ignitability of the mixtures is appreciably diminished by the addition of nitrogen, and it may be concluded that the firedamps of different mines will vary slightly in their susceptibility to ignition by sparks.

The next point investigated was the effect of the self-induction of the circuit. Sample coils of various inductances were experimented with, and it was seen that the amount of current required for the ignition of any of the mixtures tried increases rapidly so soon as the self-induction falls below 0·03 henry. For example, at 90 volts for self-induction of 0·00815, 0·03175, 0·06350, and 0·09510 henries respectively the currents required for ignition of an 8 per cent. mixture were 0·94, 0·42, 0·26, and 0·19 ampere. The amount of current in the circuit is of far greater importance than the voltage, especially with highly inductive circuits. Thus an 8 per cent. methane-air mixture is ignited by the break flash with a current of from 0·24 to 0·25 ampere at any voltage between 10 and 30 with a self-induction of 0·095 henry. On the other hand, at a given voltage quite a small change in the amount of current is sufficient to determine whether the flash is capable or incapable of igniting a given mixture.

A number of bells were experimented with, and the following conclusions were arrived at:—

All the bells examined were capable of producing a highly-dangerous break-flash at the signal wires when used with a battery of ten wet Leclanché cells, the voltage being 15. The break-flash was still more dangerous when a battery of ten dry cells was employed, since the current available from them is considerably greater than that obtainable from wet Leclanché cells. In general, the bells examined were "overpowered." A single bobbin with a reduced number of layers of wire was found in several cases, when fitted to the original bell-frame, to actuate the bell as efficiently as is required in practice. The use of only one bobbin with a small number of layers of winding reduces the self-induction of the circuit and thereby decreases the danger of the break-flash at the signal wires.

Inasmuch as the current voltage is relatively of little importance compared with that of the current strength, so far as the safety of the break-flash on the signal wires is concerned, it is desirable that attention should be directed towards not exceeding a certain maximum number of cells in the battery, rather than that care should be taken not to exceed a certain voltage. Moreover, it is desirable that a cell of comparatively high internal resistance, such as the wet Leclanché cell, should be employed, so as to avoid the possibility of obtaining large currents on short-circuiting the battery.

Taking as a standard battery ten wet Leclanché cells, quart size, such as are commonly used for battery-bell signalling systems, giving a voltage of 15 and a maximum current on short-circuiting of about 1·5 amperes, it is possible so to modify the usual pattern of bell as to render the break-flash at the signal wires safe in the most sensitive methane-air mixture, without impairing the ringing power of the bell. This can be done in several ways, of which the simplest probably are:—(1) By the introduction of a non-inductively wound resistance coil in series with the magnet coils such that it will reduce the current available at the break-flash below the minimum igniting current. (2) By increasing the resistance of the magnet windings of the bell by the use of wire of fairly high resistance, such as brass wire, for the same purpose. (3) By the use of an additional short-circuited secondary winding. (4) By the use of tinfoil strips between the layers

of winding. Of these four methods the third may be open to the objection that should the short-circuited winding be accidentally broken the bell might become unsafe.

No experiments were made as to the igniting power of the maintained spark at the trembler of the bell, for it was apparent from the bells examined that the provision of an adequate flame-tight casing, affording complete security against ignition of a firedamp-air mixture at the trembler of the bell, was not a difficult matter.

ELECTRIC MINERS' LAMPS

THE Home Office, in an Order (No. 249) dated March 16th, has approved of the three makes of electric miners' lamps mentioned below:—

The Pearson Lamp, made by G. Pearson & Sons, Ltd. (Abbott Road, Poplar, E.). This has a steel case, a cover provided with a flame-tight bayonet joint, a magnetic lock, a well protecting glass with rubber cushions, and a special bayonet joint lamp-holder, of which the upper part is easily removable to replace the bulb. The battery has spring terminals, and also rests on a spring at the bottom of the case. The lamp weighs 4½ lbs. complete.

The Wornshop Lamp, made by Wornshop & Co., Ltd. (Halifax). This has a steel case, with stamped steel cover fitted with a double magnetic lock, and a cylindrical protecting glass. The crown of the lamp, to which four pillars are riveted, consists of a ring of steel, the underside of which is recessed to hold a circular lens or steel disc and metal reflector, and to form the upper seating of the protecting glass. The pillars attached to the crown pass through holes in the bulb carrier plate and slots cut in the cover, and are secured to a flanged metal ring by nuts on the underside. The flanged metal ring carries an insulated disc fitted with switch contacts, and makes a flame-tight joint with the cover. The protecting glass makes a flame-tight joint with the crown and bulb carrier plate by means of asbestos or other suitable washers. This lamp weighs 5 lbs. complete.

The Rothwell Lamp, made by J. H. Rothwell & Co. (Swinton, Manchester). The principal constructive feature is a cover forming a flame-tight connection with the case, and consisting of a middle base ring of brass or steel carrying an aluminium or steel crown supported by four or more brass or steel pillars. The middle base ring is screw-threaded internally to take a celluloid glass-retaining plate. A stout protecting glass forms flame-tight connections with the crown and retaining plate by washers of asbestos or other suitable material. The glass-retaining plate also carries the lamp-holder and an insulated electrical contact piece. This lamp weighs 5½ lbs.

All the above lamps maintain a light of 1 c.p. all round in a horizontal plane for not less than 9 hours, and also a light of not less than 1·5 c.p. over an arc of 45 degs. in a horizontal plane.

The following addition to the official description of the "Ceag" lamp has been made:—

As an additional safety device, a fuse arrangement may be fitted through which the current from the battery will be short-circuited should the spiral spring that holds the bulb in position become displaced (by fracture of the protecting glass, for example). When this fuse, which is enclosed in a flame-tight space, is melted, the electric current through the lamp cannot be re-established until a new fuse has been inserted.

ELECTRO-METALLURGICAL PATENTS OF APRIL

IN Specification No. 14,192 of 1914 E. F. Côte and P. R. Pierron describe a process of zinc purification consisting in smelting the ores in one electric furnace and refining the product in another. In this process the zinc vapour is freed from the gases coming from the smelting bed and condensed into drops or powder, and submitted in the second furnace to redistillation. The metal is thus refined as it is produced while still at a temperature near that of volatilisation.

In Specification No. 23,495 of 1914 G. Gmür Zehnder describes an electric resistance furnace for dealing with refractory materials, in which an inner heating tube enclosing the material under treatment is itself surrounded by an outer tube also carrying current, so that external loss of heat is prevented and the tube and its contents are protected from oxidation.

ELECTRIC WINDING PLANT AT BURLEY COLLERY

AN interesting electrical colliery equipment is that of the Burley Colliery of the Midland Coal, Coke & Iron Co., Ltd., where extensive use is made of power generated from coke-oven and blast-furnace gases. The power-house for this purpose contains three 375-kw. "Witton" alternators driven by vertical four-crank tandem "National" gas engines, and

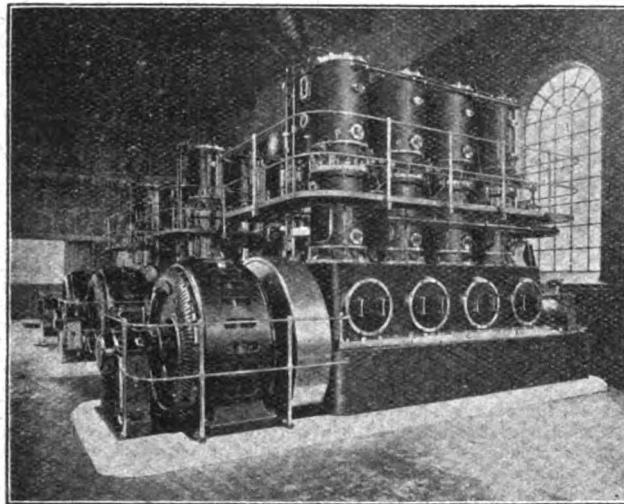

FIG. 1.—GAS-DRIVEN 375-kw. ALTERNATORS.

generating three-phase power at 550 volts, 25 cycles, and a 160-kw. steam-driven "Witton" generator with the necessary switchgear. The gas-driven sets are seen in Fig. 1.

The most interesting item of the motor-driven plant is the electrically-operated winder. This winder, which is shown in Fig. 2, is situated at the Burley Pit, the Company closing down their Sladdehill Pit as far as coal-winding is concerned, the coal from the latter being brought up by way of the upcast shaft of the Burley Pit. The winding drum is of the double-cone type, from 7 ft. to 18 ft. in diameter, and 11 ft. 8 in. wide over the flanges. The brakes are of the double-post type, lined with wood blocks, worked by a foot-lever during normal working. For emergencies a vertical lever fitted with overwinding attachment operates a trip gear, which, releasing a weighted lever controlled by a dashpot, gradually applies the emergency brake. A failure of the current supply also brings into operation a solenoid, which

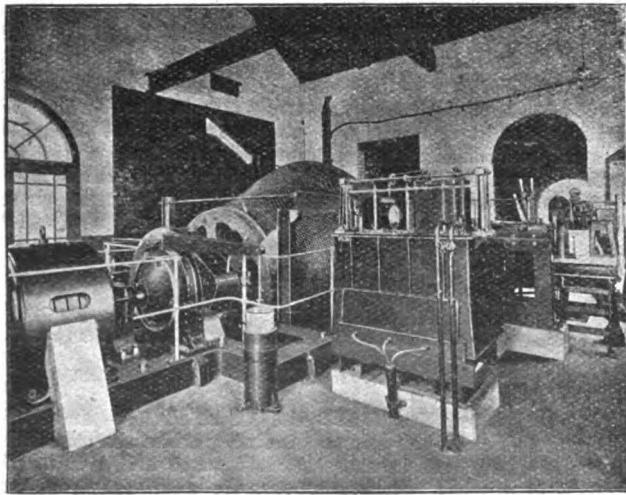

FIG. 2.—THREE-PHASE WINDER AT BURLEY COLLERY.

will apply the brake, and, in addition, a hand lever is provided by which the operator can apply the brake when desired. The trip lever in operating cuts out the motor by means of an emergency switch. To replace the emergency brake after an application, a small hand-wheel is provided on the driver's platform. The drum is driven by a 145-b.h.p. "Witton" motor (continuous rating), specially designed for heavy overloads. This motor runs at 240 r.p.m., and is geared to the drum shaft through single reduction gear running in an oil bath, and giving a drum speed of 39 r.p.m. The depth of the shaft is 458 yards, and the gross load of 30 cwt., or alternatively 12 men, is raised in 80 seconds. The winding

speed varies from 1,030 to 1,450 ft. per minute, and the h.p. at the end of the accelerating period—12·25 seconds after starting—is 179, dropping during the running period to 86 h.p. The retarding period is equal to the accelerating period.

The controller, of the liquid type, involves a new principle, avoiding the disadvantages of the rising and falling weir pattern, and is completely mistake-proof. It is arranged so that the operator cannot inadvertently accelerate or retard at any other than a predetermined rate. The main operating lever actuates both the reversing switches and the valve in the control tank. A special device preventing the stator switches being left partially in contact is provided. This also has a function of preventing the driver inching by rapidly switching on or off. There are three notches only for this lever, an off position and a full-on position for either direction. The regulating lever is situated outside the main control lever, and has a number of notches representing different speeds; it can be set for either full or for any fraction of full speed.

The winding gear is fully equipped with safety devices. There is a depth indicator of the vertical type driven from the drum shaft, and provided with an overwinding attachment, and an over-speed gear of the high-speed Hartnell governor type is also provided, and controls the speed of the cage at every point in the shaft. Should the driver fail to effect the necessary reduction in speed when nearing the end of the wind, the over-speed device, which is set to operate on a 5 per cent. speed increase, opens the motor circuit and applies the weighted brake lever. The resistance is cut out of the rotor circuit by the downward motion of three movable electrodes connected together to form the star point of the circuit, and these dippers are attached by a chain fastened over pulleys to a float in an entirely separate tank. When the float rises the dippers are lowered and cut out the resist-

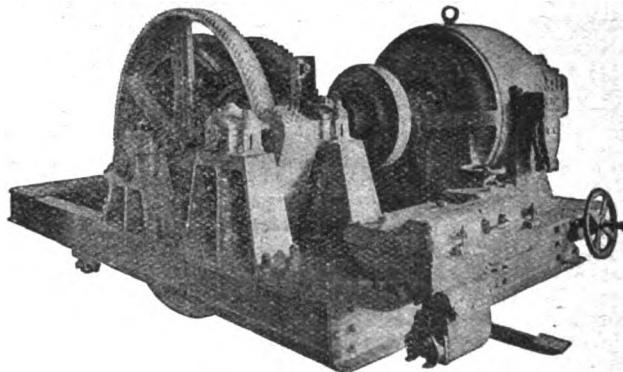

FIG. 3.—HAULAGE GEAR DRIVEN BY 100-H.P. PIPE-VENTILATED MOTOR.

ance, their movements in this way being delicately controlled. The float tank is constructed in two portions, an inner and outer tank, water being kept constantly in circulation from the outer to the inner one by means of a small motor-driven centrifugal pump. This water constantly flows from the inner tank unless the valve is closed by the control lever, when the level of the water rises at a predetermined rate, carrying with it the float, which thus lowers the dipper blades in the control tank and runs the motor up to the predetermined speed. The speed to which the motor accelerates is controlled by the position of a shutter forming one side of the inner tank, this shutter being itself controlled by a separate lever, which can, if desired, be placed permanently in any position, or alternatively can be used during each wind. If this second lever is put to the slow position, the motor will accelerate to the slow speed, when the main control lever, which is normally used by the driver, is put either in the forward or the reverse position. On the other hand, if the regulating lever is pushed into the full position, the motor runs up to full speed when the main lever is put over.

There are two stator switches, one for each direction of running, and these are so interlocked that they cannot both be put on at the same time. The rotor connections accommodate the fixed terminals in the starter tank. The power cost of raising coal from the full depth of the shaft by this gear is 0·5d. per ton. The electrical equipment was supplied by the General Electric Co., Ltd., of Witton, Birmingham, Messrs. M. B. Wild & Co., Ltd., of Nechells, Birmingham, being responsible for the mechanical portion of the winding gear.

Amongst the other electrical equipment of a colliery are a number of pumps, haulages, and so forth, driven by "Witton" motors. Among these attention may be called to the haulage shown in Fig. 3, which is of interest, inasmuch as the gear was constructed by the colliery engineers themselves. It is driven by a 100-h.p. pipe-ventilated "Witton" motor.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,441.

Are small continuous-current fan motors series or shunt wound, and why?

(Replies must be received not later than first post, Thursday, May 13th.)

ANSWERS TO No. 1,439.

What special precautions are needed in the design of porcelain bobbins for winding resistance wire for heating purposes and winding the wire thereon, and what current density can safely be used?

The first award (10s.) is given to "L. R." for the following reply:—

The basis of the design of porcelain insulators for the purpose mentioned should include reference to the following facts:—

The minimum thickness employed at any part should be $\frac{1}{8}$ in., so that the material is sufficiently strong notwithstanding the slight variations which always occur in the body of ordinary porcelain. In this connection it must be noted that the smallest section is more thoroughly baked than a larger section, and flaws are more frequently found in all large pieces of porcelain, and many times they are the determining factor in finding the strength. The lack of homogeneity in porcelain is a serious drawback. If glazed porcelain is used, this is about 25 per cent. stronger than unglazed in tension, but in compression the unglazed is the stronger, and generally employed. The glazing substance must be selected of a similar contraction coefficient to the porcelain upon which it is to be placed, and this is of particular importance as regards heaters, because the range of temperature is fairly great. The design must be such that the maximum working temperature of the porcelain does not exceed $1,500^{\circ}$ F. Porcelain does not fuse at this temperature; in fact, it requires about $2,750^{\circ}$ F. to fuse it, but it begins to conduct electrolytically at a temperature even as low as 400° F. The insulators must be so designed that even when stresses are set up due to heating, sufficient play is given that the following figures with a suitable factor of safety are not exceeded, viz., tensile stress 1,100 lb. per sq. in. unglazed, 1,400 glazed; compression strength 14,000 unglazed, 9,000 glazed.

The dielectric strength of porcelain is from 200 to 800 volts per mil., but this could almost be ignored in the design of heater bobbins, seeing that if sufficient material is given for mechanical strength, these figures will not be exceeded. In designing porcelain insulators, allowance must be made in the moulding instructions that 15 to 18 per cent. contraction occurs, and an experiment with the particular porcelain should be made, because often different contraction coefficients obtain in length, breadth, and height respectively. Further, porcelain for the above purpose should not be fired above $1,400^{\circ}$ to $1,450^{\circ}$ C. It is not the latest practice to wind wires for heaters exactly on bobbins, but rather to

provide supports for the porcelain at various parts, the design being such that the wire cannot sag. Also to assist the winding of the wire in a short space, coiled wires are used instead of straight wires. This is much better than winding straight wire on a bobbin.

A specification has just been published by Ferranti, Ltd., No. 17,945 of 1914, in which the insulator takes the form of a narrow bar with a single longitudinal ridge having two or more lateral projections at each side of the ridge, coiled wire being arranged between a series of such bars. For a 2,000-watt heater, 32 of these bars are used, the size being about 3 in. long and $4/5$ in. wide. The minimum thickness of porcelain is about 0'08 in., and this occurs where the metal rods on which the insulators are assembled pass through holes in the ends of the insulators.

In another arrangement coiled wire is wound backwards and forwards over a porcelain bar which has projections on it. The current density which can be used depends on the material employed and the temperature of working. With nichrome, which is a favourite material, a single 16 wire will take about 15 amperes to raise it to $1,000^{\circ}$ F., and 20 to $1,500^{\circ}$ F. This would require about 30 ft. in the first case, and 16 ft. in the second for the 110-volt heater. The total current density or capacity of the heater depends on its use; for a boiling plate 20 to 25 watts per sq. in. of surface is usual, a grill 15, an oven not more than 1,000 watts per cu. ft. capacity, and a room about 2 watts per cu. ft.

No second award is made.

ANSWER TO CORRESPONDENT

B. L.—The Dubilier high-frequency apparatus can be obtained from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.).

A.C. CRANE CONTROL

IT has become almost generally accepted that direct-current motors are so much more suitable for cranes than A.C. motors that it is worth while to go to some trouble to convert the current when A.C. supply only is available. In a Paper on foundry controllers, read before the American Institute of Electrical Engineers on April 15th, Mr. R. H. McLain discussed at some length the suitability of induction motors, and gave reasons for his opinion that the control could be so arranged as to make them suitable. A foundry crane differs from others by the requirement of a very uniform low value of creeping speed in the order of 1 ft. to 5 ft. per min. for certain operations, such as drawing patterns. Although 40 ft. per min. is usually chosen as the maximum hook speed, in some cases a speed as high as 60 ft. has been used; but even with the former speed it is difficult to use A.C. motors and control to obtain the low creeping speed mentioned from the same motor. In a crane intended for only one kind of work, however, it may be found on investigating the exact cycle of operation that a hook speed of, say, 12 ft. per min. would do just as much work per day as 40 ft. per min.

For maximum hook speeds up to 15 ft. per min. the author recommends ordinary rheostatic controllers, but above this, if A.C. is used, a large number of controller points are used and sufficient resistance to reduce the torque at starting to about 25 per cent. of the normal torque. Generally, he considers that A.C. will be successful if most of the creeping-speed work requires not less than 25 per cent. of the normal speed, and only a small proportion, 10 per cent., of the normal speed. Useful work at the latter speed, is however, dependent on the excellency of the "mechanical load brake," the solenoid brakes, and gearing. The mechanical load brake is described as an automatic friction-braking device, which not only holds back against the falling hook load, but also requires power from the motor to drive the load in a downward direction.

Manchester Local Section of the Institution of Electrical Engineers.—The annual report of this Section records the holding of twelve meetings during the past session. The total membership of all classes is now 732, a decrease over the figure for last year. The officers and Committee for the next session are as follows:—Chairman: B. Welbourn. Vice-Chairmen: C. J. Beaver, A. E. McKenzie. Committee: H. Alcock, C. Atchison, W. Cramp, Prof. A. B. Field, A. P. M. Fleming, S. L. Pearce, J. S. Peck, H. A. Ratcliff, J. A. Robertson, H. D. Symons, Ald. W. Walker, S. J. Watson. Past Chairmen: Prof. E. W. Marchant and P. P. Wheelwright. Hon. Secretary and Treasurer: J. Frith. Assistant Secretary and Treasurer: A. L. Green.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published April 29th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

136/14 and 3,221/14. Heaters. J. R. QUAIN. The first of these describes an immersion heater in which the wire is wound on a hollow support of silica and is contained in a cylindrical annular space between the support and a silica cover, fused on, so as to form a hermetically sealed chamber which can either be exhausted or filled with an inert gas. (Seven figures.) The latter describes a water heater of the geyser type, in which a large tubular heating element of the same construction is used. (Two figures.)

8,505/14. Arc Lamp Carbons. H. AYRTON. A copper-covered negative carbon, having a core consisting of a central carbon pencil surrounded by a packing composed of a material which burns away and leaves a space round the central carbon pencil for a certain distance from the tip. (One figure.)

14,577/14. Distribution Systems. B.T.-H. Co. (G.E. Co., U.S.A.). A method of obtaining a flexible voltage at the generating and receiving ends of a transmission line, which consists in holding the voltage at the receiving end at a definite value by regulating the power factor by synchronous boosters with automatically controlled excitation. (Two figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c. MYERS and MYERS [Conduit fittings] 18,277/14.

DYNAMOS, MOTORS AND TRANSFORMERS: B.T.-H. Co. and SHUTTLEWORTH [A.C. commutator motors] 9,578/14.

Heating and Cooking: NEGUS and NEGUS [Ovens] 1,377/15.

Ignition: KELLER-DORIAN [Magneton] 8,931/14; NEWTON (Mosler) [Sparkling plugs] 16,308/14.

Incandescent Lamps: HIRSCH [Lamp casings] 17,889/13.

Switchgear, Fuses and Fittings: MARKS and HELSEL [Lamp-holders] 3,702/14; ANNAND [Plugs and sockets] 9,305/14;

ESKRIGÉ [Shade carriers] 9,659/14; JONES, WILSON and SHEPHERD [Control of fan motors] 9,726/14; BERAUD [Time switches] 17,986/14.

Telephony and Telegraphy: AUTOMATIC TELEPHONE MANUFACTURING CO. & NEWFORTH [Telephone systems] 27,533/13 and 1,969/14; BETULANDER AUTOMATIC TELEPHONE CO. and ATKEN [Impulse transmitters] 6,209/14; GRAHAM and RICKETS [Distant control of signals] 6,214/14; AUTOMATIC TELEPHONE MANUFACTURING CO., SPERRY and RAY [Telephone systems] 9,648/14; DIXON [Synchronising systems for multiplex telephony] 9,666/14; McGAURAN [Telephone-call recorders] 12,233/14; GIRARDEAU and BETHENOD [Spark gaps for wireless telegraphy] 15,031/14; THOMPSON [Perforators] 21,090/14.

Traction: SOC. ANON. DITE S.T.A.R. (*Système de Traction Auto Réglatrice*) [Motor control] 15,155/14; THOMPSON [Electromagnetic perforators] 21,090/14.

Miscellaneous: TOKALON, LTD., and PRATT [Electric hair brushes, &c.] 4,908/14; HAMMOND [Control of torpedoes, &c., from a distance] 6,171/14; CLAUDE [Neon vacuum tubes] 2,020/15.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Instruments, Meters, &c.: BLATHY [Adjusting meters] 5,319/14.

Telephony and Telegraphy: TIGERSTEDT [Microphone] 5,174/14; GES. FÜR DRAHTLOSE TELEGRAPHIE [Wireless receiving apparatus] 5,342/14.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: CALENDAR'S CABLE & CONSTRUCTION CO., LTD. [Fuse and junction boxes] 1,054/03.

DYNAMOS, MOTORS AND TRANSFORMERS: A. P. WOOD and LANCASTER DYNAMO & MOTOR CO. [Brush holders] 1,006/07.

Incandescent Lamps: B.T.-H. (A.E.G.) [Welding of filaments to supports] 814/07.

Storage Batteries: K. R. SMITH [Battery terminals] 1,034/07.

Switchgear, Fuses and Fittings: G. W. MASCORD [Controllers for printing press motors] 876/06.

Telephony and Telegraphy: W. D. KILROY [Order telegraphs] 1,229/02.

Traction: B.T.-H. CO. (G.E. CO., U.S.A.) [Control of petrol-electric vehicles] 930/06; E. M. MUNRO & RAILLESS ELECTRIC TRACTION CO. [Earthing of vehicle frames] 1,067/09.

ELECTRIC TRACTION NOTES

The *Electric Railway Journal* (New York) quotes statistics from Berlin to the effect that the loss of traffic on the Berlin tramways in the second half of 1914, as compared with 1913, was 15·1 per cent., notwithstanding that a large amount of omnibus traffic was diverted to them, for the corresponding diminution in omnibus traffic was 32·8 per cent., largely owing to withdrawal of vehicles for war service. The "Hochbahn," which in the first half of 1914 had carried 45·1 per cent. more passengers than in the first half of 1913, owing to the opening of the Wilmersdorf line, showed a decrease of 27·2 per cent. in the second half of 1914.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The total number of employees of the Post Office Engineering Department who are with the Army is now about 5,000, representing about 20 per cent. of the total number employed. It is expected that more men will gradually be released for special duty.

At the annual meeting of the Indo-European Telegraph Co. on Thursday, it was stated that the Indo route to India and beyond was totally interrupted in Germany on July 31st, 1914, without notice, i.e., before the declaration of war.

CATALOGUES, PAMPHLETS, &c., RECEIVED

FANS.—A very effective leaflet dealing with fans has been produced by the Edison & Swan United Electric Light Co., Ltd. (Ponders End, Middlesex), and can be overprinted with contractors' names and addresses in quantities over 250. The cover has a charming view of a polar bear on an iceberg, and is inscribed, "Be cool this summer. Let's tell you how."

Readers desiring copies of catalogues or pamphlets should apply to the firms in question, referring to the notice in "Electrical Engineering."

ELECTRIC BELLS. A folder from the Electrical Supplies Co. (53 Victoria Street, Westminster, S.W.), gives particulars of the British-made electric bells which they are placing on the market. These bells are made in London factory, and large stocks are held for immediate delivery.

MOTORS.—A very convenient little pocket note-book is being issued by the Langdon-Davies Motor Co. (110 Cannon Street, E.C.), containing on the first few pages some useful tables, as well as particulars of the company's standard sizes of A.C. and D.C. motors.

Siemens' Employees in H.M. Forces.—A booklet has been issued by Siemens Brothers & Co., Ltd., and Siemens Brothers Dynamo Works, Ltd., giving the names of the employees of the two firms from the various works, offices, branches, &c., who are now serving in H.M. Forces. We are pleased to see that over 1,000 men have joined the Colours, and we understand that a number more have joined since the booklet was printed.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Australia.—The Sydney Council requires one or two 12,000-kw. turbo-alternators, with exciters, surface condensing plant, auxiliary plant, oil cooler, steam separator, &c. July 19th. Further particulars at 73 Basinghall Street, E.C.

Coventry.—Extensions are to be carried out to the switchboard, and the cost is to be met out of revenue.

Haslingden.—The L.G.B. has sanctioned loans of £4,600 for mains and £2,770 for services, transformers, and switch-gear.

Leeds.—Steam feed and water pipes for 18,000 kw. of plant. Borough Electrical Engineer. May 28th. (See advertisement on another page.)

Leigh.—One vertical tube boiler, one 250-kw. rotary converter or motor converter, and one switch panel. Borough Electrical Engineer. May 21st.

London: Battersea.—The Finance Committee of the L.C.C. recommends sanction to a loan of £9,000 for mains, house services, and meters.

Stepney.—The Finance Committee of the L.C.C. recommends sanction to a loan of £15,000 for mains, feeders, and general extensions.

Woolwich.—The Finance Committee of the L.C.C. recommends sanction to a loan of £35,000 for new plant at the Globe Lane power station. This plant is required in connection with Government contracts, but a condition attached to the sanction by the Treasury is that the outstanding balance on April 1st, 1920, in respect of loans originally granted for forty-two years for existing plant shall be repaid in half the period unexpired on that date. In reporting upon this scheme the Finance Committee reiterates the opinion expressed some time ago that the Council would have been wiser to have adopted a partial bulk supply scheme in preference to extending the Globe Lane station, but the Committee does not feel justified in pressing the Borough Council to reconsider its decision. By the scheme now adopted, Sir John Snell, whom the Borough Council has consulted, states that the net loss on the undertaking will be reduced from £16,000 to £9,561.

Manchester.—Crane, conveying plant, &c., for Barton power-house. Chief Electrical Engineer. June 2nd. (See an advertisement on another page.)

Todmorden.—The L.G.B. has informed the Council that it cannot consent to the proposed loans of £1,000 for mains and £200 for motors unless they are required for works on account of war requirements.

York.—The Corporation has decided that the extension of electric mains to Strensall, Poppleton, and Naburn, and the erection of cooling tanks at the electricity works are imperative, and that their abandonment would involve heavy financial loss to the city.

Wiring

Edinburgh.—Waste Paper Buildings, Powderhall, Broughton Road. City Electrical Engineer, Dewar Place. May 12th.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Birmingham.—New post office. Surveyor, Birmingham P.O.

Cardiff.—Block of offices, 97-8 Bute Street. Architect, Henry Budgen, 95 St. Mary Street.

Chelmsford.—New offices for Prudential Assurance Co.

Ilford.—Carnegie Library (£6,000).

Kingston-on-Thames.—Elementary school.

Manchester.—New post office, Droylsden.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Aberdare.—The tender of Bruce Peebles & Co. for motor-converters and H.T. switchboard, feeder pillar, &c., has been accepted.

Croydon.—Two economisers having been condemned by the Insurance Co., the Electricity Committee recommends the

acceptance of a tender by E. Green & Co. for a new 384-tube economiser at £831.

Dublin.—The Electricity Supply Committee has received tenders for a supply of carbons for the street arc lamps. The best offer is by Messrs. Geipel & Co. at 12 guineas per thousand pairs for open-type arc lamps for twelve months, but without any guarantee of delivery. The firm is able to deliver immediately 40,000 pairs at £12 per thousand, and the Committee decided to make this purchase. The tender of C. W. Webster of Bingley, Yorks, for 20,000 pairs of 15-inch carbons at £8 10s. 1d. per thousand pairs, 15,000 pairs of 12-inch at £6 16s. 1d. per thousand pairs, and 20,000 pairs of 25½-inch at £2 18s. 9d. per thousand feet, has been accepted. These supplies, it is anticipated, will keep the street lighting adequately maintained until the end of October.

Dundee.—The successful tenderers for twelve months' supply of electrical stores were the Edison & Swan United Electric Light Co.

London: Hammersmith.—Messrs. Johnson & Phillips, whose tender was recently accepted for box frames, covers, boxes, &c., for 1915-16, have asked the Council to release them from their offer owing to the difficulty of supplying the goods in consequence of Government work, and their request has been granted. Messrs. W. Lucy & Co., the next lowest tenderers, are to be asked if they will accept the contract.

Manchester.—The following tenders have been accepted by the Electricity Committee:—Three 1,250-k.v.a. static transformers, British Westinghouse Co.; cable, W. T. Glover & Co., Union Cable Co., British Insulated & Helsby Cables, Callender's Cable & Construction Co., Johnson & Phillips, and Western Electric Co.; three 3-wire balancers, Lancashire Dynamo & Motor Co.; one 250-k.v.a. transformer, British Electric Transformer Co.; one 650-kw. rotary converter, British Westinghouse Co.; three 1,000-k.v.a. three-phase static transformers, Ferranti, Ltd.

The Mirrlees Watson Co. have recently received orders for condensing plant from the Torquay Corporation (third set); South Leicestershire Colliery Co. (two sets); Compagnie Française Thomson-Houston, Paris, for Tuiliere Power Station (fourth set), also for Athens Power Station (third set); and Tharsis Sulphur & Copper Co. (three sets). Orders have also been received for plant for Bourges (France), Senegal, Russia, Japan, Straits Settlements, and West Indies.

Messrs. Venner & Co. have received contracts for a twelve months' supply of Chamberlain & Hookham meters from the Maidenshead, South Shields, and Bradford Corporations.

Messrs. Ferranti, Ltd., have secured contracts for a twelve months' supply of meters to Belfast, Halifax, Heston & Isleworth, Swindon, Wimbledon, Grays, Grimsby, Birkenhead, Alloa, Liverpool, Kilmarnock, and Bradford.

Tyres for Electric Vehicles.—In view of a decision by the leading manufacturers of solid rubber tyres that such tyres will in future only be guaranteed for 10,000 miles within a period of 12 months, Edison Accumulators, Ltd. (2 and 3 Duke Street, S.W.), announce that their experience of the better wear of tyres on electric vehicles enables them to give a guarantee of 12,000 miles within 15 months for tyres sold by them with their electric vehicles.

Union Cable Co. and Government Contracts.—In answer to a question by Mr. Booth in the House of Commons on Thursday, Mr. Beck (Lord of the Treasury) said that a contract was recently given to the Union Cable Co. by the Government. He was aware, he added, that the principal holding in this company is in German hands. The Managing Director is an Englishman (Mr. Blackwood), and the other four directors are German. The action of the Office of Works in this matter is in accordance with the policy laid down, in common with other departments, by H.M. Government in the Trading with the Enemy Act. Mr. Booth pointed out that the other directors are Bernard Hirschman, Siegfried Hirschman, Julius Hirschman, and Moritz Kremer, and that the Deutsche Kabelwerke Allgemeine Gesellschaft of Berlin holds 48,218 shares out of a total of 50,000. Mr. Beck said the company's works were in Essex, and a number of English people were employed, and not a penny profit of any kind went to the German people.

Newcastle Electricians and the War.—A meeting of the electrical section of the Newcastle Chamber of Commerce was held last week, when it was unanimously resolved, states the *Newcastle Daily Journal*, that the members of the section would offer their individual help in their spare time to the Munitions of War Committee in any capacity; that each firm represented would state to the Munitions Committee what special work it was able to do and willing to do for the War Office or the Admiralty; and that the opinion of the Munitions of War Committee should be taken as to whether this committee should approach similar bodies and ask for promises of individual help, should it be required.

LOCAL NOTES

Aberdeen: Clerks as Switchboard Attendants.—Mr. J. A. Bell, the City Electrical Engineer, reports that twenty-seven of his staff are in the Army, and that seven men have been allowed to join since the winter load was over. To keep the works running it has been necessary to use the clerical department and to train the members as switchboard attendants.

Barking: L.G.B. and Proposed Loan.—In connection with an application for a loan of £18,000 for extensions at the Council's electricity works, the L.G.B. has stated that unless the proposed expenditure, or some part of it, is necessary for military purposes, the loan cannot be sanctioned at the present time. The Board offered to hold a local inquiry to ascertain to what extent the loan in question is required for military purposes, and the Council has asked for this.

Belfast: Re-organisation of Electricity Department.—The proposed scheme for re-organising the Electrical Department, on the basis that Mr. T. W. Bloxam, the City Electrical Engineer, resigned as a preliminary, was lost at the meeting of the Corporation on Monday by two votes. The matter has been temporarily abandoned until the Council can hold a meeting in Committee again.

Cleethorpes: Mains Extension Abandoned.—A scheme for spending £10,000 on mains extensions has been abandoned for the present owing to the attitude of the L.G.B.

Eccles: Wiring Inspection.—The Borough Electrical Engineer is preparing a report upon the desirability of asking the Home Office to place under the charge of their local inspectors of factories the duty of inspecting and approving wiring installations carried out by local wiremen.

Edinburgh: Electricity Deficit.—The estimates of the Electric Light Committee for the coming year show a deficit of £5,000, and the question of whether this is to be made up by increasing the charges or otherwise is now under consideration.

London: Woolwich: Increase in Charges.—The charges for electric supply are to be temporarily increased by $\frac{1}{2}$ d. per unit for lighting other than for factory use, and $\frac{1}{2}$ d. per unit for power consumers except those having agreements obtaining a coal clause. Power consumers are to be offered the option of a coal clause in their agreements in substitution of the extra charge.

Manchester: Increase in Charges.—The Electricity Committee has now formulated its definite recommendations with regard to the increases in charges for electric supply indicated in our last issue. The charges for domestic lighting, cooking, &c., are to be increased by 10 per cent.; industrial power charges by 15 per cent.; the rateable value system is to be increased from the fixed charge of $12\frac{1}{2}$ to 15 per cent., and the total charge on this basis, including the charge for current, is to be then increased by 10 per cent.

Rotherham: Electric Supply Accounts.—The report of the Borough Electrical Engineer shows that the financial results of the year to March 31st, 1915, fell below those of the previous twelve months, the gross profit being £2,201 less. The net profit, after providing for capital charges, is £4,786, or £2,572 less than in the previous year. The total cost of generation has increased from 0'651d. to 0'7d. per unit.

Yorkshire: Electricity Supply.—Following the rejection of the Yorkshire Electric Power Co.'s Bill, referred to in our last issue, the Councils of a number of districts in the Company's area are being asked to consider a joint municipal electricity scheme.

APPOINTMENTS AND PERSONAL NOTES

The Coventry Electric Light Committee recommends that the salary of Mr. G. Tough, the Electrical Engineer and Manager, be increased from £650 to £750 per annum.

Alderman Miller has resigned the Chairmanship of the Croydon Lighting and Electricity Committee, a post which he has held for eighteen years.

The Erith Electricity and Tramways Committee have decided to pay Mr. A. Coveney, the late Electrical Engineer, a month's salary, viz., £33 6s. 8d., in consideration of his services in a consulting capacity for two months after his resignation.

Mr. F. S. Grogan informs us that, after eight years' active work in connection with the "Tricity" cookers, he will very

shortly sever his connection with the British Electric Transformer Co., Ltd., in order to take up an appointment as manager of a new concern for the manufacture and sale of electric fires and cookers. In the meantime, any personal communications may be addressed to him at 14 Argyll Mansions, Beaufort Street, Chelsea, S.W.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £85 10s. to £86 10s. (last week, £87 to £88).

Increase in Prices.—G. St. John Day (Patents), Ltd. (Bank Mill, Morton Street, Oldham), announce that their prices are increased by 10 per cent.—The Benjamin Electric, Ltd. (1A Rosebery Avenue, E.C.), announce an increase of 10 per cent. in the greater part of their list prices.

Anglo-Portuguese Trade.—The Lisbon Chamber of Commerce has issued a circular relating to trade relations between Great Britain and Portugal containing proposals regarding giving effect to the recent treaty of navigation and commerce between the two countries, and giving a list of goods in which trade may be increased. Manufacturers and dealers are requested to send wholesale lists to the Representative, Lisbon Chamber of Commerce, 26 Exchange Street East, Liverpool.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Johnson & Phillips.—The net profit for 1914, after charging £7,000 for maintenance of buildings, plant, &c., was £37,119, in addition to £12,755 brought forward. After meeting debenture interest and transferring £8,158 to depreciation, a balance of £24,295 remains, from which a dividend of 5 per cent. for the year is recommended on the ordinary shares, carrying forward £15,545.

British Thomson-Houston Co.—The report for 1914 states that prior to the outbreak of war the Company was making excellent progress in all its departments, but in August and September the business was seriously disturbed. In a comparatively short time, however, satisfactory readjustments were made to cope with the new conditions, with the idea of doing as much work as possible to meet the requirements of the Government, and at the same time to carry out as far as reasonably possible obligations to other customers. Over 1,000 employees have joined the Colours. The Company has been manufacturing munitions of war at its various factories for months, and a large number of machine tools have been installed for this purpose. The net profit for the year was £87,107, and of this £73,309 have been set aside for depreciation, and the balance of £13,798 is carried forward.

Willans and Robinson.—The report for 1914 states that the Company is now largely concerned in Government work. There was a net profit of £17,058 after paying debenture interest and providing for depreciation and the upkeep of Queen's Ferry Works, which are now utilised by the Government.

South Wales Electrical Power Distribution Co.—Notwithstanding the dislocation of trade during the last five months of 1914, the Company's business shows an increase, the output being 698,167 units more than in the previous twelve months. The whole of the working expenses are borne by the Trefores Electrical Consumers Co., and the South Wales Co. shows a surplus, after meeting debenture stock and depreciation, of £5,347, compared with £2,915 in the previous year. The accumulated profits are now sufficient to deal with the indebtedness of £13,500 due to certain members of the Trefores Co. A new issue of capital will be necessary to deal with the expansion of the business.

SUMMARY

A GREAT conference of the electrical and gas industries was held at the Institution of Electrical Engineers last week to frame some course of action in order to prevail upon the Government to facilitate coal supplies (p. 204).

MORE electrical engineers are still wanted for the Electrical Emergency Service—particularly men over military age—in certain districts of London (p. 204).

SOME additions have been made to the standardisation rules of the B.E.A.M.A., dealing with tolerances between guarantees and test results, parallel running of alternators, and other matters (p. 206).

A HOUSE of Lords Committee has given the Plymouth Corporation full municipal wiring powers, whilst a House of Commons Committee has insisted upon the Lincoln Corporation carrying out wiring through a contractor (p. 206).

THE calculation of the size of feeder cables is dealt with in our Questions and Answers columns (p. 207).

AMONG the subjects of specifications published last Thursday at the Patent Office were locking lamp-holders, plugs and sockets, A.C. motors, electric traction, and telephones for air craft (p. 208).

AN exhibition of articles of British manufacture in fields of industry where German competition has been seriously felt is in progress at the Agricultural Hall (p. 208).

A REFLECTOR fitting for half-watt lamps and a tramway section switch are described on p. 209.

AN automatic stoker is required at Dublin; mains and motors at Derby; cable at Southampton; new plant at Willesden; and a motor-generator and accessories by the Victorian Railway Commissioners.—The Waterford supply scheme is being proceeded with, and plant is required for a hydro-electric power station in Spain (p. 209).

THE Treasury has suggested that the L.C.C. should delay the installation of the two new turbo-generators at Greenwich.—War contracts are being delayed at Leigh (Lancs.) on account of the difficulty in obtaining L.G.B. sanction to a loan.—The Coventry electricity works had a record output last year.—Rapid progress is being made with the temporary Birmingham new power station (p. 210).

Arrangements for the Week.—(To-day) Thursday, May 13th.—Iron and Steel Institute, at Institution of Civil Engineers. Annual Meeting. 10.30 a.m.

Friday, May 14th.—Iron and Steel Institute. Annual Meeting. 10.30 a.m.

Physical Society of London, at Imperial College of Science, South Kensington. "On Electrically Maintained Vibrations," by S. Butterworth. 8 p.m.

Tuesday, May 18th.—Illuminating Engineering Society, at Royal Society of Arts. Discussion on "Some Points in Connection with the Lighting of Rifle Ranges." 8.15 p.m.

Obituary.—We regret to record the death, from a severe attack of pneumonia, of Mr. H. F. Friederichs, Borough Electrical Engineer at West Hartlepool. Mr. Friederichs, who was fifty years of age, had held this post since the Corporation undertaking commenced in 1889. It is only a short time ago that the success of his scheme for utilising the waste steam from the Seaton-Carew blast furnaces for the purpose of generating electricity was recorded. It will be remembered that Mr. Friederichs was in attendance at the electricity works during the bombardment of Hartlepool by the Germans in December, and under his direction supply was maintained throughout without interruption.

Finance and War Time.—In connection with the recent Treasury notice prohibiting the issue of new capital by joint stock companies during the war and for twelve months afterwards without consent, a Bill has been introduced into the House of Commons entitled "Statutory Companies (Redeemable Stock) Bill." This Bill enables parliamentary companies, including electric supply companies, to issue redeemable preference or debenture stock. These companies can at present only issue stock on war terms, and in many cases will have no power to redeem any stock so issued when normal conditions again prevail. The Bill is framed, therefore, to provide for the redemption of any stock so issued on such terms and conditions as may be specified in a resolution of the company. This only applies to stock authorised to be created or to be issued before the outbreak of the present war, or after the outbreak of the present war and before the coming into force of the new Bill. A point on this latter provision has been raised with regard to the private Bills now passing through Parliament, it being argued that several of them may receive Royal assent a day or two after the Government Bill, and therefore will be deprived of the advantages of it. The Bill has already passed the House of Commons, and the point in question is to be brought before the authorities of the House of Lords with a view to suggested amendment being carried out.

COAL SUPPLIES

Joint Conference of Electricity and Gas Undertakings

AT the Institution of Electrical Engineers on Thursday, May 6th, a joint conference of representatives of the electrical and gas industries was held to discuss means whereby the Government can be induced to give immediate consideration to the needs of the electrical and gas industries in the matter of coal supplies. As we have already reported in our columns, a deputation representing the two industries waited upon the President of the Board of Trade (March 11th, p. 103), but, so far as we are aware, no action has followed unless the Order in Council issued last week prohibiting the export of coal except to British Colonies and the countries of our Allies is a direct outcome of this conference.

The Conference on Thursday, which was presided over by Sir Corbett Woodall, Governor of the Gas Light & Coke Co., had the support of the Institutions of Electrical and Gas Engineers, and Sir John Snell, President of the Institution of Electrical Engineers, welcomed the Conference, which numbered some six hundred.

As a result of the discussion, the three following resolutions were passed :—

(1) That this Meeting congratulates the Government on having appointed a Committee to deal with the exportation of coal, and hopes that this may be effective in limiting exports, but views with the deepest concern the depleted stocks of coal and the difficulty, under present conditions, of renewing them for present and future requirements, and urges the Government to take further and immediate steps :—

- (a) To increase the output of coal from the pits.
- (b) To give greater facilities for the transport of coal by rail, and
- (c) To have regard, in requisitioning steam colliers, to the requirements of the Public Utility Undertakings which depend for their supplies on sea-borne coal.

(2) That the Government be asked to take such steps as may be necessary to reduce the price of coal to reasonable limits.

(3) That a representative deputation of the gas and electricity industries be now appointed to present our case to the Members of Parliament, and to take such further action as may be found advisable.

That a Conference with Members of Parliament be held in London on _____ to seek their aid in urging upon the Government immediate action to give effect to the above recommendations.

That each Authority represented pledges itself to take steps to secure the presence of their Member or Members of Parliament at the proposed Conference.

SIR CORBETT WOODALL, in opening the Conference, said that whilst at the beginning of the war the difficulties of obtaining coal supplies were largely a matter of freightage, to that had now been added the difficulty of price and an absolute shortage in coal supplies. Until recently there was sufficient coal available at the pits, and the increased cost of freightage was the chief complaint. It was, however, no longer a question of money, for the gas and electrical undertakings were faced with an actual famine in coal supply, which, however, was due to preventable causes. The question was a vital one to the nation, and extreme measures were necessary and inevitable. He felt that the Government should give a preference to the gas and electrical industries in transportation facilities both by sea and land, and on the question of price, the profits of the colliery owners and royalty owners should be limited in some way. Further difficulties had been introduced by the reduction of output, due to the enlistment of a large number of miners, whilst the increase of wages to those who remained had also had an effect. He had been told by an official in a responsible position in a Government department that the importance of the matter had been over-rated, that he was prepared to carry on his work by candlelight, and was not alarmed at the prospect of darkness throughout London; one aim was to bring the war to a successful end. On this latter point, needless to say, everybody was agreed, but it was surely well to consider with care the means by which it was to be accomplished. In making demands upon the Government to act, it was not a question of the gas and electrical industries seeking commercial profits for themselves. Both industries had statutory duties to perform, and it would be a catastrophe were it impossible to keep the industries of the country going owing to the impossibility of supplying sufficient gas and electricity.

SIR JOHN SNELL said the Council of the Institution of Electrical Engineers was desirous of doing all that was possible to assist in this most important matter provided that it did not embarrass the Government or the authorities in the proper conduct of the war, which must, of course, come first and foremost. At the same time, coal was necessary to the gas and

electrical industries for reasons of public health and public safety.

ALDERMAN KAY (Chairman of the Manchester Gas Committee), in proposing the first resolution, said that his undertaking was worse off for coal to-day than it was at the time of the coal strike. On March 31st the stock was 70,000 tons below the normal, and they were not obtaining supplies which more than equalled the consumption, and seeing that the gas and electrical undertakings were doing all they could to help the Government by supplying factories manufacturing munitions of war, it was evident how serious the question was.

MR. FRANK BAILEY (City of London Electric Lighting Co.), who seconded the resolution, expressed his satisfaction at meeting members of the gas industry in connection with this matter. They had met before on many occasions, sometimes in a sphere of hostility and sometimes upon matters of urgent necessity. They had laid side by side in the footways for many years, and when they had met they had generally exploded. He thought much credit was due to the electrical undertakings in detecting gas leakage, and that the gas undertakings had to thank the electrical industry for their proportion of unaccounted-for losses of gas being so small. In regard to coal supplies, his opinion was that facilities should be given to the electrical and gas industries even if no coal were available for the householder. Electricity and gas works should be regarded as the coal cellars of the country, and the potty little coal cellars of private houses should be prohibited. Unless active measures were soon taken, it would be perfectly hopeless to obtain a stock of coal sufficient to meet next winter's demands, and as an instance of the difficulties which were being encountered he said that the Admiralty was paying 35s. per ton f.o.b. for Cardiff for Welsh steam coal. Against this, what chance had the gas and electrical undertakings? If the real seriousness of the matter could be impressed upon the Government, he thought that some action would be taken. So far as he was concerned, he had no complaint whatever to make against the people who acted as intermediaries for getting the coal from the colliery to the point of consumption. The merchants had done all they possibly could.

MR. JOHN BOND (President of the Institution of Gas Engineers) said the gas industry had approached various Government departments on many occasions with regard to this matter, and he was pleased that the Board of Trade was now taking steps to restrict the exportation of coal.

MR. R. A. CHATTOCK (Chief Electrical Engineer, Birmingham), who represented the I.M.E.A. in the absence of Major Richardson, the President, said that in many cases stocks of coal had been reduced to something like 25 per cent. of what they were at the commencement of the war, although at the present time larger quantities were being purchased. The recent coal report dealt largely with the private consumer, but his demand only represented a tithe of the quantity consumed to supply the power and lighting required by factories employed on Government work, which it was essential to safeguard and maintain at all costs. The average increase in price at the present time was about 50 per cent. over the prices which ruled before the war commenced, and in the case of the municipal electrical undertakings this represented a total of between £500,000 and £600,000 per annum.

MR. REGINALD NEVILLE, M.P. (Bradford Gas Co.), said that unless something was done immediately, the public would have to be urged to restrict their consumption of gas and electricity. He hoped the Conference would put forward some concrete suggestion for getting over the difficulty, because unless something definite was placed before the Government department concerned nothing would come of the Conference. There was a great difficulty about using interned ships for transport, and there was no chance of getting more ships. There might be a possibility of the two industries combining to get hold of a colliery and working it themselves. He recognised that this was a risky business, but in time of war we must take risks. Another matter to which he called attention was that in times like these it was necessary that the Government should relax some of the onerous statutory conditions attached to the two industries, such as, for instance, pressure in the case of electricity and purification in the case of gas.

BAILIE IRWIN (Chairman, Glasgow Gas Committee) anticipated great benefit from the recent decision to restrict the export of coal, and was not disposed to recommend his consumers to economise. In Glasgow the total reserve on the occasion of the deputation to the Board of Trade a short time ago was 27,000 tons, against a normal of 100,000, but since then 77,000 tons had been bought, so that Glasgow was not so badly off.

SIR ALEXANDER KENNEDY (representing the Westminster Electric Supply Corporation) expressed his entire sympathy with the resolution, and agreed with Mr. Neville in the hope that something definite would be put before the authorities. He supported Mr. Bailey's remarks as to the behaviour of the coal merchants. He was certain that these were not making any extra profit; indeed, he had a suspicion that some of them were losing money in order to fulfil their contracts.

MR. HARRY JONES (Chairman of the Gas Companies Protection Association) said that charity began at home, and that

something should be done to prevent competition for our coal from abroad, which was bringing about fabulous prices.

SIR DANIEL GODDARD, M.P., said he gathered from conversations with men prominent in the coal industry that stopping the exportation of coal would largely bring about the object which the Conference desired.

BAILIE LINDSAY (Edinburgh) said that no less than 67 million tons of coal were exported from Great Britain in 1911. Another direction in which action should be taken was to suspend the operation of the Eight Hours Act, which was provided for under Clause 4 of the Coal Mines Regulation Act of 1906. Facts seem to show that the output of coal from the mines had been restricted by the action of the miners to the extent of 30 per cent.

A DELEGATE, apparently from a mining district, strongly denied that there was a general reduction in output by the miners. In his district the present output was larger than that for the corresponding period of last year.

THE CHAIRMAN said he believed there was no question whatever that the output of coal had been very materially reduced.

COUNCILLOR F. W. Dow suggested that an addition should be made to the resolution asking the Government to take over a mine which produced coal suitable for electricity and gas works.

THE CHAIRMAN said he could not accept this, and the first resolution as set out above was put and carried unanimously.

ALDERMAN PHILLIPS (Chairman of the Salford Gas Committee) moved the second resolution. He strongly felt that if prices did not soon fall to a suitable level, the Government should consider a scheme for assuming control over the output of all collieries during the continuance of the war.

ALDERMAN FRED HALL (Chairman, Workington Corporation Gas Committee) said that the cause of high prices was due to the colliery owners' associations. In his district the whole of the coal was sold through one association, and although he had been offered coal by his merchant at a price of 2s. 3d. per ton less than that fixed by the association, the latter had refused to allow the merchant to deliver at this lower price, notwithstanding the exceptional circumstances.

BAILIE SMITH (Chairman, Glasgow Electricity Committee) said he had heard only that day from a most trustworthy source that a large factory in Sweden for which we were supplying all the coal was manufacturing munitions for the Germans.

SIR JOSEPH BELLAMY (Plymouth) pointed out that the question of price could not be dealt with except by consideration of all the circumstances and the cost of production in every district before the war and now. It was a monstrous proposition that, if a gas company had a contract with a shipowner for twelve months, the Government should take a considerable portion of that firm's tonnage and possibly pay 50 per cent. more to the owner of the ship over the contract price, whilst the gas company had no compensation whatever, and had to pay probably from 200 to 300 per cent. more for other vessels.

MR. J. CHRISTIE (Chief Electrical Engineer, Brighton Corporation), speaking as a representative of an undertaking dependent entirely on sea-borne coal, said he paid about £15,000 a year for the partial services of a coaster which was not worth more than about £5,000, and evidently the profits of the owners were colossal. He suggested that the Chancellor of the Exchequer should limit the profits of such people to about 15 per cent. He also had no complaint whatever to make against the merchants who were supplying him.

A DELEGATE moved an amendment to the resolution by which the Government should be asked to fix the prices in accordance with the increased cost of production on the renewal of contracts.

THE CHAIRMAN said he did not think this was an amendment. The resolution in its original form was put to the meeting and carried by a very large majority.

THE CHAIRMAN then put the third resolution to the meeting. He said that if Mr. Neville had had an opportunity of reading this before he spoke he would not have thought there was no concrete proposal to be placed before the Government.

SIR JOHN SNELL seconded the resolution, which was carried unanimously.

It was decided to appoint the following deputation to Members of Parliament provided for in the third resolution:—

Sir Ryland Adkins, M.P. (Herne Bay Gas & Elec. Co.).

Mr. E. Allen (Liverpool Gas Co.).

Mr. F. Bailey (City of London Elec. Ltg. Co.).

Mr. J. Ferguson Bell (Derby Gas Co.).

Sir Joseph Bellamy (Plymouth & Stonehouse Gas Co.).

Mr. John Bond, President of Institution of Gas Engineers (Borough Gas Engineer, Southport).

Mr. W. G. Bradshaw (Commercial Gas Co., London).

Dr. C. Carpenter (South Metropolitan Gas Co.).

Mr. W. A. Chamen (South Wales Elec. Power Dist. Co.).

Mr. R. A. Chattock, representing the I.M.E.A. (City Elec. Engineer, Birmingham).

Mr. F. E. Cooper (Sec. Gas Cos.' Protection Ass.).

Mr. A. C. Cramb, President-Elect, I.M.E.A. (Borough Elec. Engineer, Croydon).

Mr. W. T. Dunn (Sec., Institution of Gas Engineers).

Mr. H. A. Earle (Yorkshire Elec. Power Co.).

Sir J. Fortescue Flannery, Bart., M.P. (South Sub'n Gas Co.).

Sir D. Ford Goddard, M.P. (Ipswich Gas Co.).

Mr. J. S. Highfield (Metropolitan Elec. Supply Co.).

Captain R. S. Hilton (Birmingham Corp. Gas Dept.).

Baillie Irwin (Glasgow Corp. Gas Committee).

Mr. J. R. H. Jacobs (Southampton Gas Co.).

Mr. H. E. Jones (Wandsworth, Wimbledon & Epsom Distr. Gas Co.).

Ald. Kay (Manchester Corp. Gas Committee).

Sir Alexander Kennedy, F.R.S.

Mr. A. Masterton (Edinburgh & Leith Corp. Gas Dept.).

Mr. C. H. Merz (Newcastle Elec. Supply Co.).

Mr. Reginald Neville, M.P. (Brentford Gas Co.).

Mr. G. W. Partridge (London Elec. Supply Corp.).

Mr. S. L. Pearce (City Elec. Eng'r, Manchester).

Ald. F. S. Phillips (Salford Corp. Gas Dept.).

Mr. W. E. Price (Hampton Court Gas Co.).

Mr. P. F. Rowell (Sec., Institution of Electrical Engineers).

Mr. A. H. Seabrook (Marylebone Elec. Supply).

Mr. James Smith (Belfast Corp. Gas Dept.).

C'r W. B. Smith (Electricity Committee, Glasgow Corp.).

Sir John Snell (President, I.E.E.).

Mr. C. P. Sparks (County of London Elec. Supply Co.).

Sir Albert Stanley (or other representative of the London Electric Railways Co.).

Mr. C. D. Taite (Lancashire Elec. Power Co.).

Mr. Hanbury Thomas (Sheffield United Gas Light Co.).

Mr. F. J. Walker (St. James's & Pall Mall Elec. Light Co.), representing the Conference of Chief Officials of London Electric Supply Companies.

Mr. D. Milne Watson (The Gas Light & Coke Co., London).

Sir Corbet Woodall (Gas Light & Coke Co., London).

THE ELECTRICAL EMERGENCY SERVICE

THERE are still many young men, keen and anxious to join the Army, who are being kept at home and obliged to continue their duties as switchboard attendants until other men who are unable to go away and fight can be found to fill their places. The Electrical Emergency Service is finding these other men. At the moment, we are devoting our attention particularly to London, where some hundreds of men will be wanted.

We have enrolled many members, several of whom are now already on duty at sub-stations in various parts of London, but very many more are wanted. The greatest number of offers have been for half-shifts (averaging four hours) for alternate nights. To release each man, four half-shifts on alternate nights are of course required, and for working half-shifts in the midnight hours, it is obvious that the volunteers must be men living near the stations or sub-stations. Some of the people on our register are still unplaced, owing to there being no call at present in the particular district in which they reside, but others are living in districts in which their services are required but are being kept waiting for more enrolments in order that the groups of four may be made up. We want *every* electrical engineer in London who will give four hours a day, or four hours on alternate nights, to become enrolled, and we want them most urgently in the following districts: Hammersmith, Wandsworth, Tooting, Streatham, Clapham, Stockwell, Battersea, Camberwell, Holborn, Camden Town, Islington, Mildmay Park, Clapton, Hackney, Limehouse, Barking, Poplar, Woolwich, Lewisham and Forest Hill. Although this list is a long one, it by no means represents the whole of the requirements; but in these districts the demand for assistance is being acutely felt.

Moreover, it is the *good men* we most want: for instance, men over military age who have filled or are filling good positions in the electrical profession, who have arrived at the stage when they might normally take things a little easier after the strenuous life which this profession always imposes on its devotees, but who are willing now to defer their rest a little longer in view of the national emergency.

Applications for enrolment, on the form on p. ix, should be sent to the Editor of ELECTRICAL ENGINEERING, 203 Temple Chambers, London, E.C., who will be pleased to reply to any inquiries for further information, and from whom also further application forms may be obtained.

THE B.E.A.M.A. STANDARDISATION RULES

A NEW edition was recently issued of the Standardisation Rules for Electrical Machinery (excluding railway and tramway motors) which have been provisionally adopted by the British Electrical and Allied Manufacturers' Association. The first six sections, relating respectively to standard pressures and frequencies, high-pressure tests and insulation resistance, types of machines, rating, overloads, and heating arc, contain practically no alterations since the first edition published in 1913, which we reviewed in ELECTRICAL ENGINEERING, Vol. IX., p. 285, May 22nd, 1913. A supplement has, however, been added, comprising seven sections dealing with tolerances, parallel running, commutation, short-circuit tests, terminal markings of transformers and machines, and switchgear symbols.

A tolerance is defined as the amount of permissible difference between the observed results and the guaranteed results. The figures recommended are 2° C. for observations of temperature rise, and the following for efficiencies, &c.:—Steam consumption, 2½ per cent. Transformers, 0·25 per cent. if over 98 per cent., and 0·4 per cent. if under. Generators, motors, and converters (by summation of losses):—If full load efficiency is 95 per cent. or over, tolerance ½ per cent.; from 93 to 95, ¾ per cent.; 90 to 93, 1 per cent.; 85 to 90, 1½ per cent.; 75 to 85, 2 per cent.; 65 to 75, 3 per cent.; below 65, 4 per cent. If the determination is by the input-output method, these tolerances may be increased by ½ per cent. over 88 per cent., and 1 per cent. below. Power factors, above 0·9, 2 per cent.; from 85 to 90, 3 per cent.; 75 to 85, 4 per cent.; 65 to 75, 6 per cent.; below 65, 8 per cent. Where efficiency guarantees are required at practical loads, it is recommended that they be given in the form of an average load guarantee based on the sum of four times the full load efficiency, three times the ¼ load efficiency, and twice the ½ load efficiency, divided by nine. The same tolerances as above apply to this figure. Speed of motors:—Shunt, 5 per cent. of full load temperature; series, 7½ per cent. Slip of induction motors, 50 per cent. tolerance. Inherent pressure regulation, 2/5 of value specified.

With regard to conditions for satisfactory parallel running of alternators and other synchronous machinery, with reference to the permissible amount of angular displacement from uniform running due to periodic irregularity in the turning movement of the prime mover, it is pointed out that a periodic angular displacement of 2½ electrical degrees will usually cause 15 to 20 per cent. exchange current, and this is the limit recommended. This limit corresponds to a cyclic irregularity (i.e., max. minus min. divided by mean speed) equals number of engine impulses per revolution divided by six times the number of poles. In any case, this should not be more than 1/16. Hunting due to resonance between engine impulses and the natural electro-mechanical frequency of the system can be met by suitable flywheels or dampers on the generator. The total foot tons of energy stored in the flywheel for this purpose should be:—

$$1\frac{3}{4} \times \text{poles} \times (\text{strokes per engine cycle})^2 \times \text{k.v.a.}$$

r.p.m.

The electrical damping arrangement can only be relied on when the coefficient of fluctuation of energy does not exceed 10 per cent.

The section regarding commutation reads as follows:—D.C. machines must operate throughout the range from no load to the highest specified overload with fixed brush setting. The operation must be practically sparkless from no load to full load, and without injurious sparking up to the maximum specified overload.

The section on short-circuit tests on alternators points out that no guarantees regarding short-circuit currents should be undertaken in connection with machines required to have close inherent regulation. In view of the regulators available, close regulation is regarded as unnecessary.

In further sections of the rules a system of arranging and marking transformer terminals and machines is described, a matter where uniformity is most desirable; and the final section gives rules for drawing switchboard diagrams with standard colouring of phases, symbols and lettering for instruments, and diagrammatic symbols of the usual character for switches, connections, gear, and parts of machines.

An Indicator for Detecting Shorts on Tramway Feeders.—In Mr. Braid's article on this subject on page 194 of last week's ELECTRICAL ENGINEERING, in the inscription under Fig. 1, the bottom figures on the dial of the indicator were given as referring to the value of I . This should have been the value of x , the resistance of the short.

MUNICIPAL WIRING

TWO interesting decisions have been given by Parliamentary Committees since our last issue in connection with municipal wiring.

The first one concerns Plymouth. The Plymouth and Devonport Corporations were amalgamated into a larger Plymouth last year, and this session the Plymouth Corporation came to Parliament with a Bill to consolidate the various Acts of Parliament relating to the two old boroughs in order to have one code relating to the new and enlarged borough. The old Devonport Corporation had full municipal wiring powers, obtained in the early days, no provision being made for the work being done through a contractor. On the other hand, old Plymouth had no wiring powers of any description. In the Consolidation Bill this session a proposal was made to extend the Devonport wiring powers to the whole of the new borough, but this was opposed by the Plymouth Mercantile Association, which numbers among its membership the electrical contractors in the town. This Association asked for what is known as a "Model Clause," viz., that under which, although the Corporation may borrow money for wiring, all work must be done through a contractor. The case for the Corporation was that in Devonport the full wiring powers have been extremely useful in extending the supply, and although it was shown by the opposition that the rate of progress of the old Devonport electrical undertaking had not been so rapid, where the Corporation did wiring direct, as that in Plymouth, where the contractors did the work, yet Mr. J. W. Sparks, the Engineer-in-Charge of the Devonport section of the enlarged Plymouth undertaking, stated that this was entirely due to the character of the population in Devonport, which was a shifting one, composed as it is largely of workmen employed in the dockyards. He gave figures showing that, compared with the period when the Corporation did not have these powers, the rate of progress had been very rapid. Several electrical contractors were called on behalf of the opposition, and Mr. Leonard Tate, Secretary of the Electrical Contractors' Association, was also in attendance instructing counsel for the Plymouth Mercantile Association. In the end, however, the House of Lords Committee which was dealing with the matter decided to grant the old Devonport powers to the new and extended borough of Plymouth.

The second case was that of the Lincoln Corporation, which was considered by the Local Legislation Committee of the House of Commons. In the Lincoln Corporation Bill, as originally drafted, some interesting clauses were included dealing with the question of wiring, as detailed on p. 8 of our issue for January 7th. Briefly, these gave full wiring and hiring powers with an option to enter into agreements with contractors, and a special clause was inserted for securing co-operation between the Corporation and the electrical contractors. That, however, met with considerable opposition by the electrical contractors, and the Bill came before the Committee with the original clauses struck out. These were substituted by a new clause agreed between the Corporation and the Electrical Contractors' Association, providing that the Corporation could sell fittings to a consumer after they had been on hire for three years. It also provided that if, as the result of a visit to the Corporation showrooms, a sale of fittings was effected through a contractor, 25 per cent. of the discount received by the contractor was to be paid to the Corporation as profit. All wiring work, however, was to be carried out through a contractor. The Local Legislation Committee is very loth to depart from the clauses in the "Model Bill," and the promoters admitted that this clause differed very widely from the "Model Clause" in form, but said that the essentials were preserved. It was pointed out on their behalf that local authorities were very hampered by the "Model Clause," and a member of the Committee suggested that perhaps this was intended to be the case. Eventually the Committee decided that although the proposed clause had been agreed with the Electrical Contractors' Association, the "Model Clause" must go into the Bill.

Institution of Civil Engineers Premiums.—Telford Premiums have been awarded by the Council of the Institution of Civil Engineers to Dr. H. F. Parshall for his paper on "Economics of Electrical Railway Distribution," and to Mr. H. E. Yerbury for his paper on "Electrolysis by Return Currents."

The Institute of Marine Engineers.—The headquarters of this Institute have been removed from Romford Road to The Minories, Tower Hill, E., to which address all communications for the Secretary should be sent.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,442.

A 12-pole single-phase alternator, the rotor of which has open slots and is wound like an ordinary D.C. wave armature, has an extremely bad regulation on low power factors ($\cos \phi = 0.3$ to 0.5).

Ratio of Pole arc to Pole pitch = 0.63. Air gap = 0.05".

Can the regulation be improved without re-winding the rotor? If not, should slots in rotor between the poles be left empty, so as to diminish the rotor demagnetising effect? Would tunnel slots in the rotor improve the regulation? With 121 slots in rotor, should tappings be taken from slots 1 and 11 or 1 and 61?—"YELE."

(Replies must be received not later than first post, May 20th.)

ANSWERS TO No. 1,440.

A mixed load (90 per cent. induction motors) of 300 kw. is required at 450 volts, three phase, 50 cycles, at a distance of 200 yards from the supply. Calculate size of three-core paper cable, and prove that it is the economical size when supply is 5d. per unit.—"CABLE."

The first award (10s.) is made to "L. R.," who writes as follows:—

The first point to determine is the current per phase of the system. This equals

$$\frac{K \times 1,000}{E \times F \times 1.73}$$

where K = kilowatts = 300
 E = volts = 450, and
 F = power factor = say 0.7.

Thus, current per phase equals

$$\frac{300 \times 1,000}{450 \times 0.7 \times 1.73} = 550 \text{ amperes.}$$

For a paper lead cable each core would require to have an effective area of just over $\frac{1}{2}$ sq. in. at the thousand amperes per sq. in. standard, or about 0.9 of a sq. in. at the I.E.E. standard, the list sizes in each case being respectively 61/0'108 and 91/0'112.

Now for the most economical size conductor, Kelvin's law is ordinarily employed as a test. This law says if the capital outlay on a conductor varies in strict proportion to the weight of the metal, then the most economical size is that for which annual cost of interest and depreciation equals annual cost of wasted energy. In this case the capital outlay does not directly vary with the weight of metal. First of all because of the kind of conductor. Also the particular ratio cannot be definitely ascertained, as no data are available showing how the cable is to be laid, and so on. The principle involved can, however, be explained by assuming the capital outlay to be in proportion as indicated.

Now take the cost of a three-core cable, with each core made as above at, say, £1,760 per mile, i.e., £1 per yard and £200 for the length given. Assume interest and depreciation at 10 per cent., then one side of the equation comes to £20.

$$\text{Now drop in volts} = \frac{C \times 2D}{A \times 38.5 \times 1,000}$$

where D is the length of each core, and A the area.

The drop, therefore, equals

$$\frac{550 \times 400}{0.5 \times 38.5 \times 1,000} = 2.94$$

(in the case of the cable of $\frac{1}{2}$ sq. in. section).

$$\text{Power lost} = C \times E \times F \times 1.73$$

$$= 550 \times 2.94 \times 0.7 \times 1.73$$

$$= 1,940 \text{ watts.}$$

Now, assuming the load to be on for 8 hours per day, and 300 days per year = 2,400 hours per year at ½d. per unit, the loss is

$$\frac{1.94 \times 2,400 \times 0.5 \times 1}{240} = 29.7$$

Working similarly on the other size cable, it comes to £5.4.

It will, therefore, be seen that this figure is nothing like so high as the depreciation figure, which means that the theoretical most economical section cannot be used in this case, but the smallest section must be employed that will carry the current at the highest possible rating. The case really is complicated by other factors not dealt with above.

No second award is made.

ANSWER TO CORRESPONDENT

"A. B."—(1) We cannot identify the gauge from your description. Possibly it is an ordinary vacuum gauge reading both in inches and lbs. per sq. in. (2) To obtain the power in kw. multiply the kilovolt-amperes by the power factor. (3) We do not know of any dictionary of mechanical engineering terms. Hobart's Dictionary of Electrical Engineering, 2 vols. (35s. net), or Sloane's Electrical Dictionary (7s. 6d. net) contain definitions of electrical terms. We particularly recommend the former. Our Book Department can supply copies of either.

Students' Section of the Institution of Electrical Engineers.—The Annual Report of the Students' Section of the Institution of Electrical Engineers records the holding of six meetings in London, nine in Manchester, and four in Newcastle. The usual summer tour, annual dinner, and other social functions were suspended, and only one visit to works has been held. The Annual General Meeting was held on May 5th, when Sir John Snell delivered an address.

An Electromagnetic Balance.—To meet certain requirements of chemical research, it is necessary to be able to weigh substances with considerable accuracy in a vacuum and a special balance for this purpose worked electromagnetically was described in a Paper by Dr. J. S. Anderson, read on Tuesday before the Faraday Society. The apparatus is essentially a current weighing balance reversed, as instead of weights being employed, one scalepan is replaced by a coil moving in the field of two fixed coils all connected in series and carrying an adjustable current. The details of the apparatus are worked out with great ingenuity, and a solenoid operated lever is used for releasing and fixing the beam of the balance.

Scottish Local Section of the Institution of Electrical Engineers.—The Annual Report of the Section records the holding of six meetings during the past session. The membership, including all classes, is now 385. The following officers and committee have been elected for next session:—Chairman: Mr. D. A. Starr; Vice-Chairman: Mr. J. K. Stothert; Past Chairmen (ex-officio Members of Committee): Messrs. W. M'Whirter, S. Mavor, and J. Lawson; Chairman of Students' Section: Mr. A. Page; Ordinary Members of Committee: Messrs. J. S. Nicholson, E. T. Goslin, G. Stevenson, J. E. Sayers, A. S. Hampton, Prof. J. D. Cormack, Messrs. F. H. Whysall and W. W. Luckie, Prof. M. Maclean, Messrs. A. Lindsay and A. Wilson; Hon. Secretary and Treasurer: Mr. J. Taylor; Assistant Honorary Secretary: Mr. W. F. Mitchell.

A Large Water-power Scheme for Ireland.—Some particulars of an ambitious water-power scheme in Ireland are contained in the *Irish Industrial Journal*. The scheme in question involves the combination of two power houses utilising the waters of the Shannon and Erne, and capital expenditure amounting to one and a half million pounds. The drainage area of the Shannon is 6,000 square miles, and the average discharge is given as 1,320,000 cu. ft. per min. at an available head of 40 ft., equivalent to some 60,000 h.p. all the year round. It is proposed to utilise lakes Derg, Rea, and Allen as storage reservoirs. The catchment area of the Erne is almost half that of the Shannon, but a head of 60 ft. is said to be available. Comparatively little in the way of dams would be required, although considerable dredging would be required below the fall, and a 2½ conduit would be required. It is proposed to establish transmission lines to Dublin, Cork, Waterford, Kilkenny, and other centres. There appears to be some difference of opinion as to the financial prospects of the scheme in its present form.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 6th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

3,702/14. Locking Lamp-holder. H. MARKS and S. HELSEL. This is a switch-holder for Edison screw-cap lamps in which the receptacle into which the lamp screws is mounted so that although prevented by a ratchet device from rotating when the lamp is screwed in, it is free to rotate with the lamp when an attempt is made to unscrew it. A ratchet spring is provided to ensure that the lamp brings the receptacle with it in this way. A set screw is fitted by which the receptacle can be locked when desired, and the lamp unscrewed from it, notwithstanding the ratchet spring. It is possible, however, to remove a lamp cap of a burnt-out lamp by breaking away the bulb, when an outer sleeve can be slid off and the receptacle held from revolving. (Five figures.)

9,305/14. Plugs and Sockets. J. W. ANNAND. Several forms of plug and socket connections are described in which good contact is obtained over a large area by making a portion of the interior surface of the socket or the exterior surface of the plug in a separate piece held up by springs. (Thirteen figures.)

9,578/14. A.C. Motors. B.T.-H. Co. and N. SHUTTLEWORTH. A.C. commutator machines having commutating poles, each of which is provided with one or more auxiliary leakage paths forming a return path for the commutating pole flux and unembraced by the main exciting coils. (Five figures.)

15,155/14. Electric Traction. SOC. ANON. DITE S.T.A.R. (Système de Traction Auto-Regulateur). A D.C. traction system in which the motors are started at a maximum predetermined torque, which diminishes as the motor speeds up owing to the action of a constant speed booster machine in series with the motors, which is differentially excited by components proportional, respectively, to the motor voltage and current respectively. (Two figures.)

15,700/14. High-speed Railway. A. OATES. A system of high-speed traction in which hermetically sealed passenger cars travel in tunnels from which the air has been exhausted, entering and leaving through a water seal. (One figure.)

18,127/14. Telephone for Aircraft. L. G. HAMMER. A special form of telephone for communication between the pilot and observer in aeroplanes, with the mouthpiece attached to the headgear and a microphone damped against the effect of external sounds by tufts of silk floss among the carbon granules. (Five figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Arc Lamps: ZANOTTA [Cinematograph arc lamps] 676/15.
Distributing Systems, Cables and Wires, Insulating Materials, &c.: SIMPLEX CONDUITS, LTD., and WATERHOUSE [Conduit joints] 9,123/14; BEAVER and CLAREMONT [Cables] 9,554/14; STELL [Cables] 10,440/14.

THE BRITISH INDUSTRIES FAIR

A N interesting and representative exhibition of British manufactures, chiefly in fields where German competition has hitherto been heavily felt, has been got together by the efforts of the Commercial Intelligence Branch of the Board of Trade for the benefit of trade buyers in home and overseas markets. The trades represented relate to toys, earthenware and china, glass, fancy goods, cutlery, plate, clocks, jewellery, &c. Stationery and printing and electric goods are only present in so far as they are incidental to these trades.

In the clock section there is a good display by the Synchro-nome Co. (32 Clerkenwell Road, E.C.) of a number of different forms of dials driven by their well-known impulse system from a master-clock. An exhibit of electric clocks is also made by the Silent Electric Clock Co., Ltd. (192 Goswell Road, E.C.).

DYNAMOS, MOTORS AND TRANSFORMERS: MOND (Maschinenfabrik Oerlikon) [Protection of motors against fire-damp] 9,542/14; PYRAE [Commutators] 10,050/14; MIDDLEY and VANDERVELL [Variable-speed dynamos] 24,604/14.

Switchgear, Fuses and Fittings: HIRST and BROOK [Switch-gear] 17,899/13; CARTER, MAURICE & RAILING [Lamp supports] 17,052/14.

Telephony and Telegraphy: MARKS (Electrical Experiment Co.) [Telephone transmitters] 9,637/14; McGAURAN [Telephone call recorders] 12,232/14.

TRACTION: THOMAS TRANSMISSION, LTD., and THOMAS [Driving of vehicles] 9,454/14; STUART [Electric railway systems] 9,582/14.

MISCELLANEOUS: HAMMOND [Distant control of moving bodies] 6,588/14; VÉRON [Pocket lamps] 9,768/14; REID [Electric clocks] 9,832/14; PARSONS and BENNETT [Searchlight reflectors] 10,172/14; GOLDSTONE [Portable battery lamps] 14,060/14; PORDÈS [Enclosing portable batteries] 15,363/14; SCHMIDT [Cooling towers] 21,205/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

DYNAMOS, MOTORS, &c.: ZIMMERMANN [Commutators] 5,848/15.
IGNITION: R. BOSCH [Starting arrangements] 5,865/15.

INSTRUMENTS, &c.: BRITISH WESTINGHOUSE ELECT. & MFG. CO. [Measuring instruments] 5,554/15.

MISCELLANEOUS: SCHIESSLER [Relays] 20,238/14; SIEMENS & HALSKE A.G. [Alarm system] 5,623/15.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

10,120/01. TELEGRAPHY. A. MUIRHEAD. Improvements in automatic tape transmitters.

The following are the more important Patents that have become void through non-payment of renewal fees.

DYNAMOS, MOTORS AND TRANSFORMERS: H. A. MAVOR and MAVOR & COULSON [Application of induction motors with rotatable "stators" to winding plant] 1,450/08; PHOENIX DYNAMO & MOTOR CO. and R. FOHL [Equalising connections on armatures] 1,546/08; A. G. BROWN, BOVERI & CO. [A.C. commutator motors] 20,827/09.

IGNITION: H. H. LAKE (Fabrik Elektrischer Zunder G.m.b.H.) [Electrically ignited flashlight] 1,544/02.

TELEPHONY AND TELEGRAPHY: J. E. KINGSBURY (Western Electric Co., U.S.A.) [Transposition of conductors in telephone cables] 1,389/06; A. KORN [Writing telegraphs] 1,548/07; E. RAYMOND-BARKER and AMALGAMATED RADIOTELEGRAPH CO. [Double tone wireless signalling] 1,759/07; A. ROSENBERG [Microphones for the deaf] 1,420/09.

TRACTION: G. HUGHES [Railway signal recorder] 1,589/06; E. UNVERRICHT [Railway signalling] 24,244/09.

MISCELLANEOUS: A.G. MAGNETA (Elektrische Uhren ohne Batterie und ohne Contacte) [Magneto-electric current impulse producers] 24,310/07; NATIONAL CASH REGISTER CO. (N.C.R. CO., U.S.A.) [Cash registers with electric indicating bells] 1,598/04; M. LATOUR [Electromagnets] 952/05; H. W. RAVENSHAW [Magnetic clutches] 1,781/07.

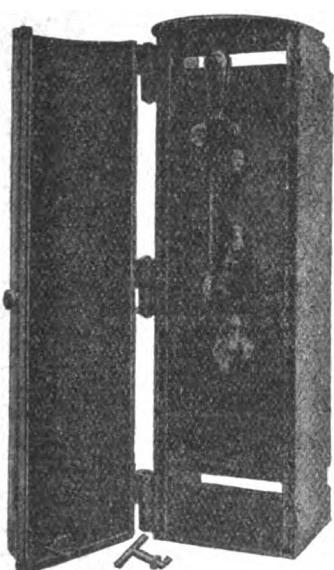

The only other branch of the electrical industry represented to any great extent is the manufacture of pocket-lamps, torches, &c., and refill batteries, a trade to no small degree in the hands of Germany before the war. The best stand of this nature is that of the New British Ever-Ready Co. (Hercules Place, Holloway), who have an extensive display embracing every variety of portable lamp. Pocket-lamps and refills of British manufacture are also shown by the Efandem Co., Ltd. (Wolverhampton), and the Surrey Electrical Co., Ltd. (9 Surrey Lane, Battersea Bridge Road, S.W.), who show various other small electrical toys and novelties. Another firm having a good stand of apparatus of this nature, covering an even more extended range, is Ward & Goldstone (Springfield Lane, Salford, Manchester). Small electrical appliances, including those of the nature of toys, are shown on several stands, notably that of the Economic Electric Co. (Twickenham), but no very striking novelty is represented. Electrical models figure to some extent in the effective show of engineering and naval models of

Bassett-Lowke, Ltd. (Northampton), and a very fine electrically worked model railway has been arranged by British Metal and Toy Manufacturers, Ltd. (Audry House, Ely Place, E.C.).

In the china and glass section, which contains a large and remarkably fine collection of the results of British industry, a few firms, such as F. and C. Osler, Ltd. (Broad Street, Birmingham), show cut-glass electric light fittings, &c., and shades, &c., are exhibited by H. G. Richardson & Sons (Stourbridge), H. Wolff & Co. (13 Bunhill Row, E.C.), and other firms. There are a few electrical instruments among the apparatus shown by J. Pitkin & Co. (56 Red Lion Street, Clerkenwell). Attention may also be called to the exhibits of special materials forming substitutes for ivory, which have many uses in the electrical industry, and in particular the hard, non-inflammable insulating material "Erinoid," of which samples are shown by Syrolit, Ltd. (Stroud, Gloucester).

It is not strictly in our province to speak of the other industries represented at the Fair, but it may be remarked that the Printing and Stationery section contains a profusion of examples of colour-printing and other illustration work showing that this country is by no means behind the Continent in that class of work. A large number of the leading firms contribute to this fine show, including our friends Messrs. Richard Clay & Sons, Ltd. (London and Bungay).

A TRAMWAY SECTIONING SWITCH

300-AMPERE TRAMWAY SECTION SWITCH.

with nuts and washers. These pass through the horizontal apertures seen at the top and bottom at the back of the case; and the two nuts tighten down on the metal-work and thereby secure the case to the pole. The Company has in hand larger sizes, and will be pleased to meet the requirements of any tramway authority.

An Iron Cross.—Dr. G. Klingenberg, director of the A.E.G., who will be remembered as having given a lecture not long ago before the Institution of Electrical Engineers, has been awarded an Iron Cross.

Imperial College of Science and Technology.—The London County Council announce that they are prepared to award for the session 1915-16 a limited number of free places at this college. Full particulars and application forms may be obtained from the Education Offices, L.C.C. Education Offices, Victoria Embankment, W.C., and applications must be sent in not later than Saturday, May 22nd.

EVERY INSTALLATION ENGINEER

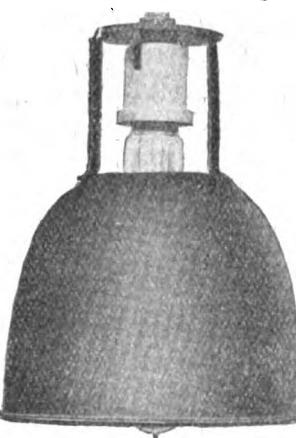

Should join his Trade Protection Organisation,
THE

ELECTRICAL CONTRACTORS' ASSOCIATION (Incorporated).

Inquiries cordially invited by the Secretary,
L. G. TATE,
20, Bucklersbury, LONDON, E.C.

A REFLECTOR FITTING FOR HALF-WATT LAMPS

A NEW form of reflector fitting for use with half-watt lamps, which has been brought out by the Benjamin Electric, Ltd. (1a Rosebery Avenue, E.C.), is illustrated here. The reflector is $\frac{3}{4}$ in. diameter, and the total height of the fitting is 12 in. Designed primarily to give maximum light efficiency for a minimum consumption in watts, the contour of the reflector is such that the bare filament is hidden from the direct line of vision, while the distribution of light is calculated to produce the most efficient illumination on the working plane. The construction is simple and the design novel, the skeleton neck ensuring ample ventilation for the lamp, while the Benjamin Goliath holder, with which the fittings are equipped, facilitates wiring and eliminates overheating of the connecting terminals. The reflectors are of vitreous enamelled steel, finished white inside and green outside, and are designed for direct lighting, a wide distributed illumination being obtained with their use.

REFLECTOR FITTING FOR HALF-WATT LAMPS.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Australia.—The Victorian Railway Commissioners require a 9-kw. motor-generator and accessories for battery charging, and four electric motors and accessories. June 30th. Offices of Commissioners, Spencer Street, Melbourne.—The New South Wales Government Railways & Tramways Dept. requires a 250-k.v.a. direct-coupled turbo-generator. Electrical Engineer, 61 Hunter Street, Sydney, N.S.W. Further particulars in both cases at 73 Basinghall Street, E.C.

Blackrock.—The Council has received sanction to proceed with its electric lighting scheme.

Derby.—An expenditure of £1,000 is contemplated upon mains and motors for supplies for war purposes.

Dublin.—Automatic stoker for Babcock boiler at Pigeon House Fort. Borough Electrical Engineer. May 25th. (See advertisement on another page.)

Kingston-on-Thames.—With regard to the proposed loan of £11,000 to meet estimated requirements on mains, &c., during the next four years, the L.G.B. has intimated to the Corporation that it is only prepared to proceed with the application with a view to the work being put in hand after the war.

Madrid.—Plant for a hydro-power station at the Principe Alfonso drainage works, Palencia, is required. Further particulars at 73 Basinghall Street, E.C.

Southampton.—New cable at an estimated cost of £500 is to be laid.

Waterford.—A L.G.B. inquiry was held last week concerning a loan of £30,000 for the Corporation's electric lighting scheme. Mr. E. M. Lacey, the consulting engineer, gave evidence to the effect that within three years the scheme, in his opinion, would be self-supporting.

Wigan.—Three-core paper- and lead-covered armoured cable; transformer and switchgear. Borough Electrical Engineer. May 29th. (See advertisement on another page.)

Willesden.—The L.G.B. has sanctioned the carrying out of extensions required for war purposes.

Wiring

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Birkenhead.—Cinematograph theatre. Architect, A. E. Shannon, 35 Dale Street, Liverpool.

Chadderton.—Hospital (£11,500).

Manchester.—Nurses' Home at the Withington Institution. Architect, F. H. Overmann, 49 King Street.

Rochdale.—Sanatorium (£14,000).

Miscellaneous

Grangemouth.—Twelve months' supply of electric lamps. Burgh Engineer.

Spain.—Submarine cable between Cadiz and Larache. Further particulars at 73 Basinghall Street, E.C.

**TENDERS RECEIVED AND ACCEPTED
AND ORDERS PLACED**

Bradford.—The tender of the Brush Electrical Engineering Co. for a 600-k.v.a. three-phase transformer at £222 is recommended for acceptance.

Leith.—A contract has been placed by the Tramways Dept. with Siemens Bros. Dynamo Works for a twelve months' supply of carbon filament lamps.

Rochdale.—Messrs. Siemens Bros. Dynamo Works have received an order for a twelve months' supply of Wotan, Traction, and Standard lamps from the Tramways Dept.

Contracts have been placed with Venner & Co. for twelve months' supplies of Chamberlain & Hookham meters for Colwyn Bay and Edinburgh. A repeat order from Cardiff for 99 Venner time-switches has also been received.

**MISCELLANEOUS BUSINESS NOTES AND
TRADE ANNOUNCEMENTS**

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £88 to £89 (last week, £85 10s. to £86 10s.).

Advance in Prices.—The India Rubber, Gutta Percha & Telegraph Works Co., Ltd., announce an advance of 10 per cent. in their prices of gutta percha, india rubber, silk, and cotton covered wires (List No. 27). List prices of tools, jointing materials, &c., are withdrawn, and quotations can be had on application.

The General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), announce a rise in prices of 25 per cent. in distribution boards, branch switches, wall plugs, adaptors, ceiling roses, cut-outs, and flashers, and 50 per cent. on lampholders.

Agency.—A firm of engineers in Milan wishes to represent British manufacturers of electric motors. Further particulars at 73 Basinghall Street, E.C.

Change of Address.—The general offices of the Smithfield Markets Electric Supply Co., Ltd., have been removed to 47 Terminus Chambers, 6 Holborn Viaduct, E.C. (Tel.: Holborn 682.)

APPOINTMENTS AND PERSONAL NOTES

Mr. J. Shepherd, who was Assistant Electrical Engineer of the L.C.C. Tramways Department under Mr. J. H. Rider, and became "Electrical Assistant in the Tramways Department" under Mr. A. L. C. Fell, the Chief Officer, on Mr. Rider's leaving, has resigned. He has acquired an interest in a well-known firm of consulting engineers, and takes up his new position on July 1st. The Council, we understand, however, are retaining his services in an advisory capacity until the end of September.

An electrical engineer is required for a mine plant in Borneo, and a shift engineer at Battersea.

LOCAL NOTES

Birmingham: The Nethells Power Station.—Such satisfactory progress has been made with the new power station at Nethells that it is anticipated supply will be given by the

end of August. There is every probability that Mr. R. A. Chattock and his staff will have constituted a record for power-house construction work. The main part of the station will consist of 10,000 kw., the plant comprising two 5,000-kw. turbo-alternators with condensers, five cooling towers, and six boilers. This first section will, as already pointed out in our columns, constitute the temporary station, and the plant is so constructed that it can be removed to form part of the permanent station later.

Coventry: Record Output.—The fact that the total number of units sold by the electricity undertaking during the year to March 31st, 1915, was 20 $\frac{1}{4}$ millions as against 16 $\frac{1}{2}$ millions in the preceding year testifies to the exceptional activity in Coventry due to the war. The Committee's report for the year brought forward high praise for the management of the undertaking in the hands of Mr. G. Tough, whose increase of salary, mentioned on p. 202 of our last issue, has been willingly granted. More than one of the large works in Coventry have dispensed with private plants and are now taking the whole of their supply from the Corporation. The net profit for the year was £22,829, and the total balance available including the amount brought forward is £28,148. Of this the Committee recommends that £6,000 be paid to the rates, £10,186 to special reserve, and £6,961 to the ordinary reserve fund of the undertaking. A sum of £2,000 is to be used for house services.

Derby: Unauthorised Borrowings.—At the last meeting of the Corporation, attention was drawn to the fact that a sum of £4,000 had been spent by the electricity undertaking without the sanction of the L.G.B. It was explained, however, that this was in accordance with the usual practice and one suggested by the L.G.B., which in ordinary circumstances preferred to hold one inquiry per annum for all borrowings required for mains extensions, and pending these inquiries the Board raised no objection to extensions in the ordinary way of business being carried out without official sanction.

Leigh: War Contracts Delayed.—The Anchor Cable Co., who are employed on Government contracts, have reported to the Director of Navy Contracts that work in hand for the Admiralty has been seriously delayed owing to difficulty experienced in getting sufficient electricity for the works. The Corporation has explained the present position of affairs to the Director of Navy Contracts, and the Council is taking steps with a view to getting the L.G.B. to expedite sanction of an application before them in which the Corporation seeks power to borrow for extensions to their electricity plant.

London: L.C.C.: Restricting Capital Expenditure.—The Treasury has suggested to the Finance Committee that the proposed expenditure of £88,000 on two additional turbo-generators at Greenwich should be deferred for, say, six or twelve months. The Treasury recognises that this is an expenditure of urgent importance which cannot be deferred indefinitely, and indicate that they will not refuse sanction for the borrowing of the money when the L.C.C. determine that it is absolutely impossible to further postpone the expenditure.

Luton: Tradesmen and Power Units.—In order to dissipate a feeling which apparently exists in Luton, as it has existed in so many other places at different times, that power supplied at low rates constitutes a serious loss to the undertaking, the Borough Electrical Engineer last week invited members of the Tradesmen's Association to visit the electricity works, and subsequently explained to them the economics of the subject of power supply.

Southport: Increased Charges.—A 10 per cent. increase in the charges for electricity is recommended.

Wrexham: Municipal Wiring.—The solicitors to the Electrical Contractors' Association have written to the Corporation asking for an undertaking that the wiring of consumers' premises and the sale of electrical fittings be discontinued. If such an undertaking is not given, it is stated that an injunction will be applied for. The Electricity Committee has replied to the effect that the Corporation does not carry out actual wiring, nor does it sell lamps or fittings.

Teleg. "Circling, Fleet, London." Telephone No.: 5509 Holborn.

Cheques to be made payable to THE KILOWATT PUBLISHING CO., LTD., and to be crossed LONDON COUNTY AND WESTMINSTER BANK (Temple Bar Branch).

SUMMARY

ALTHOUGH between 200 and 300 applications for enrolment in the Electrical Emergency Service have been received, many more are wanted, and for some districts of London they are wanted urgently (p. 212).

THE result of the ballot for the new Council of the Institution of Electrical Engineers is announced on page 213.

THE Annual Report of the Council of the Institution of Electrical Engineers records a slight diminution in membership due to the war, and calls attention to the activity of the Institution in recruiting and similar matters. Over 900 members are serving with the colours (p. 213).

AN "Electrical Wholesalers' Federation" has been formed, and some prominent firms are already known to have joined it (p. 213).

MR. G. MAURICE of the General Electric Co., and a son of Mr. Bernard Drake were lost in the *Lusitania* (p. 213).

SOME descriptive details are given of the new gas engine-driven station of the Tottenham District Light, Heat & Power Co. for the supply of the Wood Green district (p. 214).

A MOVEMENT in favour of the extension of concentric wiring in the United States and Canada has been delayed, to give American manufacturers further opportunity to consider the matter (p. 215).

THE electrical equipment of a saw mill is described (p. 215).

SEVERAL technical books are reviewed (p. 216).

A CRANK shaft broke at the Barking electricity works last week, making it necessary to shut down part of the H.T. supply (p. 216).

THE comparative merits of series and shunt wound motors for fan driving are discussed in our Questions and Answers columns (p. 217).

AMONG the subjects of specifications published by the Patent Office last Thursday were ironclad switches, conduit joints, cables, telephones, electric traction, and commutators.—A patent of A. Christmas for motor-car ignition and lighting apparatus is opposed.—One of the Edison battery patents and a B.T.-H. oil-switch patent expire during the current week after a full life of 14 years (p. 218).

OWING to the shortage of copper, German firms are making lamp-holders, sockets, and other accessories of brass-covered iron instead of brass (p. 218).

SOME new portable tools and shop window reflectors are described in our trade section (p. 219).

EXTENSIONS are to be carried out at Leigh; a 6,000-kw. turbo-alternator is required at Bristol; a small generating set for the East Sussex Asylum; new plant, £21,850, at Batley; transformers, switch-gear, and cable at Wigan; and electrical stores in various places (p. 221).

THE Hertford County Council will oppose any power scheme which interferes with their area.—Although the electricity profits at Bradford are less than were anticipated, £7,500 are to be handed over to the rates.—The Carnarvon Council will not agree to the suspension of the sinking fund by the National Electric Construction Co. (p. 222).

THE Treasury has sanctioned a new issue of capital by the S. Wales Electrical Power Distribution Co.—A 6 per cent. dividend is recommended by the E.C.C., and 15s. per share by Callender's Cable & Construction Co. (p. 222).

Arrangements for the Week.—(To-day) Thursday, May 20th.—Institution of Electrical Engineers. Meeting of Engineers' Volunteer Training Corps, who will be addressed by the Commandant, Lieut.-Col. C. B. Clay, and by Sir John Snell. 5 p.m.

Tuesday, May 25th.—Association of Supervising Engineers, St. Bride's Institute, Fleet Street, E.C. Annual General Meeting. 7.30 p.m.

Thursday, May 27th.—Institution of Electrical Engineers. Annual General Meeting. 8 p.m.

THE ELECTRICAL EMERGENCY SERVICE

ALTHOUGH we have received between two hundred and three hundred applications for enrolment in the Electrical Emergency Service, and have 107 names of suitable men entered on the register for the London district, yet we must appeal once more to our readers to enrol themselves in greater numbers. There are still a large number of switchboard attendants at the various electricity works and sub-stations who are suitable either for military duty or for work in factories making munitions of war. If their places are adequately filled by members of the Electrical Emergency Service, they will be free to leave, and help to make up the 300,000 men demanded by Lord Kitchener on Tuesday.

Large numbers have left for the Army already, a few have gone to engineering works, and we have sent members of the Electrical Emergency Service to replace several of them at the switchboard. In some cases, electrical engineers who have retired, or practically retired, from active work have come forward and have generously taken on these jobs to meet the emergency, working full shift just as the ordinary switch hands. Other members, whose business or occupation has been reduced under war conditions and has left them with time on their hands, are working four hour half shifts daily in central stations or sub-stations, while the greatest number have volunteered for the "special constable" hours of half-shifts nightly on alternate nights. It is obvious that four of the latter are required to release or replace each full-shift switchboard attendant, and it is equally obvious that, for working in the midnight hours, the volunteers must be men living near the stations or sub-stations. Some of the people on our register are still unplaced, owing to there being no call at present in the particular district in which they reside, but others are living in

districts in which their services are required but are being kept waiting for more enrolments in order that the groups of four may be made up. We want every electrical engineer in London who will give four hours a day, or four hours on alternate nights, to become enrolled, and we want them most urgently in the following districts: Hammersmith, Wandsworth, Tooting, Streatham, Clapham, Stockwell, Battersea, Camberwell, Holborn, Camden Town, Islington, Mildmay Park, Clapton, Hackney, Limehouse, Woolwich, Lewisham, and Forest Hill. Although this list is a long one, it by no means represents the whole of the requirements; but in these districts the demand for assistance is being acutely felt.

Moreover, it is the *good* men we most want: for instance, men over military age who have filled or are filling good positions in the electrical profession, who have arrived at the stage when they might normally take things a little easier after the strenuous life which this profession always imposes on its devotees, but who are willing now to defer their rest a little longer in view of the national emergency.

Those gentlemen who have sent in their applications for enrolment, and are still waiting for their services to be called upon, will, we are sure, understand the circumstances explained above. Many will be called upon to take up their duties during the next few days, and although in other cases it may be some little time before the difficult task of fitting in the remainder may be completed, it is more than probable that the services of most of those on our register will ultimately be most welcome.

Applications for enrolment, on the form below, should be sent to the Editor of ELECTRICAL ENGINEERING, 203 Temple Chambers, London, E.C., who will be pleased to reply to any inquiries for further information, and from whom also further application forms may be obtained.

ELECTRICAL EMERGENCY SERVICE APPLICATION FORM.

(Please cut out, fill in, and return to the Editor of "Electrical Engineering," 203 Temple Chambers, London, E.C.)

I wish to be enrolled as Member of the Electrical Emergency Service.

Age..... Married or Unmarried.....

Qualifications (state electrical experience)

.....
.....
.....

I am willing to work a full shift as (A) (below),

a half shift as (B), (C), (D).

(Delete the line and letters not applicable.)

My regular occupation prevents me at present from giving electrical emergency service between..... a.m. and..... p.m.

Signature

(Please write very distinctly, and give addresses very fully.)

Residential Address

Business Address.....

The Service Required.

- A. A full eight-hour shift a day, or—
- B. A half-shift (four hours) daily (1st week morning, 2nd week afternoon, 3rd week night, in rotation).
- C. A half-shift every day, without midnight work.
- D. A half-shift alternate nights with no day work.

To prevent any suggestion of competition with regular employees, wages will be paid in proportion to the existing rates at the works at which the member is employed, and to the time given.

A week's notice will be required from any member leaving the Service.

NEW COUNCIL OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE result of the ballot for officers and Council of the Institution of Electrical Engineers (see ELECTRICAL ENGINEERING, April 1st, p. 139) has been the election of the following:—**President:** Mr. C. P. Sparks. **Vice-Presidents:** Dr. A. Russell and Mr. Roger T. Smith. **Hon. Treasurer:** Mr. Robert Hammond. **Ordinary Members of Council:** Messrs. W. A. Chamen, H. Dickinson, J. Hunter Gray (Associate), Prof. T. Mather, Messrs. H. F. Procter, and C. S. Ram.

The full Council also includes the following who did not need re-election:—**Vice-Presidents:** Messrs. J. S. Highfield and C. H. Wordingham. **Members:** Messrs. R. A. Chattock, J. Christie, Prof. B. Hopkinson, Messrs. G. W. Partridge, W. H. Patchell, R. J. Wallis-Jones, and W. B. Woodhouse. **Associate Members:** Messrs. F. E. Berry, Major E. O. Henrici, R.E., and Mr. A. W. Martin. **Associates:** Messrs. E. Russell Clarke and A. M. Ogilvie, C.B.

THE INSTITUTION REPORT

THE Annual Report of the Council of the Institution of Electrical Engineers, which will be submitted at the annual general meeting on May 27th, records a total membership of 6,811, which is a decrease of 234 since last year, due mainly to a diminution in the number of students owing to the war. The following military distinctions have been awarded to members:—Brigadier-General A. M. Stuart, R.E., has been mentioned in despatches and awarded a C.B.; Commander E. G. Robinson, R.N., was promoted to that rank for distinguished service at the Dardanelles; and 2nd-Lieut. C. W. Williamson (3rd Manchester Reg.) has been awarded the Military Cross. The following have died on active service:—Sapper J. A. Donald, R.N.D., H. Labour (French Army), Major H. S. Marsh, R.E., Sec.-Lieut. J. L. Moffet (3rd Royal Scots Fusiliers), Sapper W. W. Pullen, R.N.D., Capt. G. L. Slater, R.N. (H.M.S. Bulwark), and Sec.-Lieut. E. W. Wilson (West Yorkshire Reg.).

PREMIUMS, PRIZES, AND SCHOLARSHIPS.

The following awards have been made:—

The Institution Premium (£25) to Mr. C. J. Beaver, for his Paper on cables.

The Ayrton Premium (£10) to Mr. J. H. Rider, for his Paper on power supply to the Central Rand Mines.

The Fahie Premium (£10) to Mr. H. G. Brown, for his Paper on the signalling of a rapid transit railway.

The John Hopkinson Premium (£10) to Mr. E. B. Wedmore, for his Paper on automatic protective switchgear.

The Kelvin Premium (£10) to Dr. S. P. Smith and Mr. R. S. H. Boulding, for their Paper on the shape of the pressure wave.

The Paris Premium (£10) to Mr. C. P. Sparks, for his Paper on electricity as applied to mining.

An extra premium (£10) to Mr. W. M. Selvey, for his Paper on power plant testing.

An extra premium (£5) to Mr. N. Shuttleworth, for his Paper on polyphase commutator machines.

Students' premiums have been awarded to Mr. H. Hobson (£10), for his Paper on utilisation of waste heat; to Mr. A. Arnold (£5), for his Paper on condensing plant; and to Mr. H. S. Marquand, for his Paper on electric welding.

Salamons Scholarships (£50) have been awarded to Mr. L. M. Barlow (Finsbury) and Mr. C. D. Farmer (City and Guilds Engineering College), and a David Hughes Scholarship (£50) to Mr. P. D. Morgan (King's College).

Wiring Rules and Research.—A revision of the Institution Wiring Rules is now in progress, and the Research Committee, in addition to progress with work in hand connected with magnet steels, heating of buried cables and insulating oils, are also considering the maximum current densities which can safely be allowed on conductors of various cross-sectional areas.

National Service.—The Institution at the commencement of the war initiated a scheme by which members were invited to place their services at the disposal of the Army, Navy, and Public Services, with the result that over 1,600 offers were received, including 500 for active service in the Forces, and were placed at the disposal of various Government Departments. A scheme for supplying emergency men to electric supply undertakings was also initiated, but not proceeded with to any great extent.

Mr. A. P. Trotter also suggested a scheme for the formation of a special battalion of members of professional bodies, but before any steps had been taken a request was received from the Admiralty to recruit about 670 men for the Engineer

Units of the Royal Naval Division, and, in conjunction with the Institutions of Civil and Mechanical Engineers, a recruiting office was established at the Institution, and through the labours of a Committee of Selection, consisting of Major-Gen. R. N. Ruck, Mr. W. Duddell, Mr. R. Hammond, Col. O. E. Ruck, and Mr. A. P. Trotter, this corps was fully recruited by the middle of October. In the meantime, Mr. Trotter's original scheme was not proceeded with.

The Institution has placed extensive accommodation on the first floor of its building at the disposal of the War Office and Admiralty free of rent.

In addition to recruiting the Engineer Section of the Royal Naval Division, the Institution has, at the request of the War Office, recommended a large number of suitable candidates for temporary commissions in the Royal Garrison Artillery; and the President has also nominated some of the members for special temporary commissions in the R.E.

In all, 92 members, 405 associate members, 55 associates, 64 graduates, and 312 students, making a total of 928, are serving in the Navy or the Army.

The Council is also taking steps with a view to the formation of an Engineers Volunteer Training Corps, and some 150 members have already expressed their willingness to join.

The Enemy's Trade.—Soon after the outbreak of war a Committee was formed to keep in touch with the B.E.A.M.A. in regard to the question of securing for British manufacturers the trade hitherto done by Germany and Austria-Hungary, but eventually it was concluded that the Institution could take no useful action in the matter.

Period for Repayment of Municipal Loans.—The Committee appointed last year to consider this matter has continued its inquiries, and has come to the conclusion that good grounds exist for approaching the Local Government Board to sanction periods of thirty years in the case of underground cables, sixty years for conduits, fifteen years for batteries, and thirty years for reinforced concrete, and representations will be made to the Local Government Board on these lines.

OBITUARY

George Maurice.—Among the passengers on the *Lusitania* was Mr. G. Maurice, a Director of the General Electric Co., Ltd., and, as no news has been had of him, it is now practically certain that he has lost his life. Mr. Maurice has been with the General Electric Co. for seventeen years. He was at first assistant to Mr. M. Railing in London, and, when Mr. Railing went to Witton to take charge there in 1902, Mr. Maurice was placed in charge of the fittings department in London. A few months ago he was appointed a Director of the Company. Mr. Maurice had many friends in the electrical industry, and his loss will be much regretted. He leaves a widow and one child.

Audley Drake.—Another passenger drowned on the *Lusitania* was Mr. Audley Drake, the elder son of Mr. Bernard Drake, Chairman of Drake & Gorham, Ltd. Mr. Audley Drake was not himself a member of the firm.

Stanley Bastian.—Second-Lieutenant Stanley Bastian, 4th Batt. Seaforth Highlanders, son of Mr. C. Orme Bastian, was killed in action on May 9th. He was twenty-three years of age, and an only son, and our readers will sympathise with Mr. Bastian in his bereavement.

THE ELECTRICAL WHOLESALERS' FEDERATION

An association of this name has been formed "to promote and protect the interests of wholesale dealers in and factors and suppliers of electrical goods and appliances; to promote the consideration and discussion of all questions affecting the wholesale electrical trades; to procure, circulate, and supply information (including status information); to obtain the most favourable terms and rates from manufacturers of goods and from railway and shipping companies and other carriers; to encourage the settlement of disputes by arbitration; to act as or nominate arbitrators and umpires; to promote displays of electrical goods, machinery, appliances, and fittings and drawings of the same at national and international exhibitions; and generally to watch over and protect the interests of persons engaged in selling electrical goods and appliances."

We understand that several prominent firms have joined it, and all wholesale dealers in or factors or suppliers of electrical goods and appliances are eligible as members. The manager is Mr. F. Sumner Smith, of the Electrical Equipment Company, Amberley House, Norfolk Street, Strand, W.C., and among the other gentlemen who are associated with it are Messrs. Morton Beales (Gillespie & Beales), A. G. Beaver (Sun Electrical Co.), F. Pooley (Pooley & Austin), R. W. Smith (Drake and Gorham), G. O. Donovan (Birmingham), and P. L. Davies (Downes & Davies, Liverpool).

Further particulars will be announced later.

ELECTRIC SUPPLY AT WOOD GREEN

THE statutory powers for the supply of electricity in Wood Green conferred upon the District Council in 1902 were transferred in 1913 to the Tottenham District Light, Heat & Power Co. The scheme prepared for this Company by their Consulting Engineers, Messrs. May & Hawes, was put in hand at once, and, in spite of delays due to the builders' strike and the war, the generating works and mains were ready and supply was commenced Christmas Eve, 1914. The area of supply embraces the whole of the Urban District of Wood Green, and has an area of 1,625 acres, with a population of 50,000, but one of the largest business establishments in the district, that of Edmonds, Denham & Goyder, Ltd., has its own generating plant of 240 kw. The supply is given on the direct-current three-wire system at 240 volts for lighting and heating, and 480 volts for power and special purposes. For small power requirements, where the demand does not exceed 3 kw., the supply is at 240 volts.

The generating station contains gas-driven plant, and is situated in Kingslade Road, at the rear of the Company's local offices. Town gas is supplied from the Tottenham works of the Company through a 12-in. main and a special meter. The station is a steel structure filled in with brickwork. It comprises three bays, the centre forming the engine-house. The ground floor of one of the side bays provides accommodation for the switchgear and the fitters' workshop, above which is the battery room. Water-cooling plant and silencers occupy the other bay, the water-softening plant, storage tank, offices, and stores being situated on the upper floor.

Two generating sets have already been erected, one of 100 kw. and the other of 200 kw. capacity, and accommodation has been provided for two additional sets of larger capacity. There is also a battery capable of giving 100 kw. for three hours or 200 kw. for one hour. Both these sets are driven by high-speed vertical five-cylinder gas engines built by E. S. Hindley & Sons (Bourton), running at 350 and 450 r.p.m. respectively. Compressed air is used for starting the engines, taken from a battery of four receivers charged by a motor-driven compressor. Circulating water for the engines is supplied from a tank of 1,600 gallons' capacity on the first floor. By interlocking gear the starting up of the engines without first turning on the water is rendered impossible. From the engine-jackets the water flows into two Heenan rotary water-coolers capable of dealing with 4,000 and 2,000 gallons of water per hour respectively. The water is returned to the storage tanks by means of electrically-driven centrifugal pumps. The make-up water is controlled by a ball valve on the tank, and all the water used is first treated by a Boby water-softening plant of 300 gallons capacity.

The engines are directly coupled to "tandem" direct-current dynamos of the Electric Construction Co.'s make. The dynamos are of the multipolar shunt-wound type with interpoles. The armatures of each set have been made strictly interchangeable even to the provision of a coupling outside the outboard bearing, which is protected by a cover of planished steel. The dynamos are designed to generate current at any voltage from 250 to 280.

The battery, which was supplied and erected by the Chloride Electrical Storage Co., Ltd., of Manchester, consists of 270 "Plantide" cells. Each has 29 plates. For charging the battery there is a double-ended booster of the Electric Construction Co.'s make. The two boosting dynamos each have a capacity of 19 kw., and are driven by a 58.b.h.p. 500-volt motor running at 1,200 r.p.m.

The switchboard, which also came from the E.C.C. works (Wolverhampton), consists of two generators, one battery and booster, one integrating watt-hour meter, and three feeder panels, all of black enamelled slate. The panels are divided horizontally at the centre by a slate shield, the top half being devoted entirely to the positive side of the system, and the lower half to the negative. All the circuits are protected by automatic cut-outs, and, where suitable, time-lag attachments are provided. The whole of the instruments are of the "Cirscale" type, manufactured by the Record Electrical Co., Ltd. (Manchester).

The regulating gear has been kept entirely separate from the board. The resistances are placed in a cellar, into which all the cable connections from the generators and boosters come, and also the feeder cables. Immediately above the resistances the control pillars, eight in number, including two for the battery-regulating switches, are mounted on the engine-room floor. By this arrangement it is possible for the switchboard attendant to have control of all the generating plant and at the same time to be able to see the whole of the switchboard instruments. An earth panel with an Everett-Edgcumbe disc recording ammeter, short-circuiting relay,

and overload breaker is fixed on the wall at the back of the board.

Under the contract the consumption of gas by the generating sets working at ordinary full load, with gas of 500 net B.Th.U. per cubic foot at a normal temperature and barometric pressure, is guaranteed not to exceed the following:—For the 200-kw. set 30·75 cubic ft., and for the 100-kw. set 31·35 cubic ft. per unit generated as registered by watt-hour meters. The official consumption tests have not yet been taken, but we understand that the trials of the plant and their general running on the load give warrant to the view that the guaranteed results will be excelled.

All the cables are of the three-core type, insulated with impregnated paper, lead-covered and steel-armoured. They were made at the factory of the Western Electric Co. at Woolwich. There are three feeding centres where the feeder mains serve the distributors—one situated near the Town Hall, one in the High Road adjacent to Noel Park Station, and the other in the Alexandra Park district near the junction of the Avenue and Alexandra Park Road. At these centres feeder pillars have been erected, and similar pillars in other situations provide an easy means for dividing up the network of distributing mains into suitable sections. All the pillars, service-boxes, and consumers' fuse-boxes have been made by Messrs. Lucy & Co. (Oxford). The meters for registering the supplies taken by the consumers, as well as the main meters at the generating station, are by Messrs. Chamberlain & Hookham, of Birmingham.

The prices charged by the Company for electricity range from 5d. to 4½d. per unit for lighting purposes, and 2d. to 1d. per unit for power purposes. Meters for registering the supplies are provided and maintained by the Company at a quarterly rental of two shillings.

It may be mentioned that the capital expenditure on the scheme, including Parliamentary costs, land, generating station, and mains, amounted to about £30,000. The responsibility for the preparation of the scheme and for carrying it into effect is shared by Mr. A. E. Broadberry, Manager of the Tottenham District Light, Heat & Power Co., and Messrs. May & Hawes, Consulting Electrical Engineers (Caxton House, Westminster), to whom our thanks are due for these descriptive particulars. The duties of directing and supervising the constructional operations have been performed by Mr. J. Fisher, Assistant Manager of the Company, and Mr. L. W. Ballard, Chief Assistant to the Consulting Electrical Engineers.

University of Bristol.—A new temporary residential college capable of accommodating 29 students will shortly be opened in two houses in Belgrave Road, Tyndall's Park, which have been taken for the purpose by the University.

South Wales Wiremen's Wages.—At a conference last week between the South Wales electrical contractors and the Electrical Trades Union, Mr. H. Collings Bishop presiding, it was agreed that the rate of pay of wiremen in the Cardiff and Barry districts should be immediately raised to 9½d. per hour, with a further increase to 10d. on November 1st. Armature winders are to have an immediate increase to 10d. per hour, rising to 11d. per hour on November 1st.

University College, London. A new edition of the University College, London, "Pro Patria," is in course of preparation, and will be issued shortly. Past and present students, or their relatives and friends on their behalf, are invited to send full particulars of the capacity in which they are serving the country at the present time. In the case of the Army, rank and regiment should be given; in the case of the Navy, rank and ship. These particulars should be addressed to the Publications Secretary, University College, London (Gower Street, W.C.).

The "Electric Dog."—The *Electrical World* describes a curious piece of apparatus made by an American student consisting of a little box mounted on three wheels and electrically driven and steered. The control is by means of a pair of selenium cells, in conjunction with suitable relays, &c., which form the "eyes" of the dog. The dog's master has only to point an electric torch towards his pet, and the motor starts up, causing it to run to him, the steering being effected according to the relative amount of light falling on each selenium cell, so that the dog always makes straight for the light. The inventor has applied the same principle to a burglar alarm, which rings bells, fires a revolver, and ignites a flash-light powder to photograph the burglar as soon as his lantern is pointed to it. He also hopes to construct a dirigible torpedo which will steer itself towards any searchlight falling on it.

CONCENTRIC HOUSE WIRING IN THE UNITED STATES AND CANADA

MAKERS of concentric systems of house-wiring should keep in touch with the position which is developing in the United States and Canada, in which countries considerable attention has been given to concentric wiring systems during the past two or three months. Although there, as in this country, wiring with rubber wires in conduit is recognised as the best practice, yet other methods are in use; a great deal of work is still carried out in wood casing, the very simplest open cleat wiring is by no means unknown, and "Stannos" wire has been introduced to some extent. There has recently been a movement on foot, however, to obtain a revision of the "National Electric Code" with which house-wiring in the United States and Canada must comply, to permit the use of the concentric system with bare return; and, as the supply voltage of 110 is largely in use on the American continent, some considerable support has been given to the proposal, although there has been quite a controversy in electrical circles in America with regard to it.

The Electrical Committee of the National Fire Protection Association, the body issuing the "National Electric Code," appointed a sub-committee to report on the subject of "Grounded Concentric Wiring Systems," and the report, issued to the American electrical Press last February included a set of suggested rules, preceded by the following very cautious note:—"The rules suggested are for experimental and development purposes, are only a partial outline of possible future requirements, and are subject to revision, modification, and extension. A system fulfilling the conditions outlined will not necessarily be acceptable. Suggestions for the further development of similar systems are invited. All appliances and systems should be submitted to underwriters' laboratories for examination and report." The Committee further disclaimed any intention of actually recommending that these rules should be included in the "National Electric Code."

Although this report has been subsequently withdrawn, in view of a further development which threatens ultimately to keep the manufacture of this class of wire in American hands, we may refer briefly to the main points in the rules. The system (using the uninsulated outer sheath as the return conductor, as already mentioned) is limited to exposed work on "normally grounded" supply systems with a voltage under 150 above earth. When passing through a floor, the wire is to be carried through an iron pipe extending at least 3 in. above the flooring, and "additional mechanical protection may be required by the inspection department." The radius of the inner edge of any bend is not to be less than $3\frac{1}{2}$ in. The fittings for the outlets must be "approved," and connections to the sheath must not be soldered but must be made with clamping devices. No switches or fuses are to be placed on the outer sheath, which must be electrically and mechanically continuous and bonded to any gas or water pipes with which it is liable to come in contact.

It might well be thought that these rules would give sufficient safeguards, but the Committee at the same time requested American manufacturers to submit samples of the wires and fittings. The American manufacturers took up the matter with interest—possibly with all the greater interest as they probably knew that two or three well-tried English-made systems had been on the market for several years. They undertook to make experiments and to submit samples, and the upshot of the matter was that, at the end of March, when a big four-day meeting was held for the purpose of the biennial revision of the National Electric Code, the above report was withdrawn and another "substitute report" submitted, stating that the report of the Committee appointed by the Associated Manufacturers of Electrical Supplies had been received, and requesting the co-operation of that organisation in future consideration of the subject.

So far as we can judge, with our limited knowledge of the complex procedure followed in connection with the revision of the "National Electric Code"—which it must not be forgotten is the only set of wiring rules accepted at present by the Fire Insurance Companies in Canada as well—the position is now that the alterations permitting earthed concentric wiring systems to be used generally cannot come in force for another two years, during which time the American manufacturers should be very ready to meet the demand for material. There is then, however, likely to be a big field for this class of wiring in the two countries, and we recommend British manufacturers not to let the matter rest in the meantime.

ELECTRIC DRIVING IN A SAW MILL

THE application of the electric drive to the machinery installed in sawmills is a comparatively simple problem, as sawmill machinery rarely calls for speed control, and merely requires a motor running at constant speed continuously throughout the working hours. With steam driving it has been customary to burn the refuse for heating the boilers, but with the installation of electric motors the refuse can be sold, and it is found that there is a ready market for it. Naturally in a sawmill there is a considerable amount

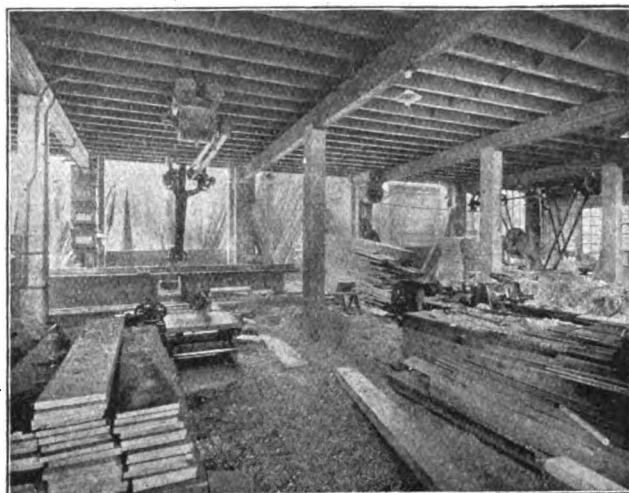

FIG. 1.—CROSS-CUTTING CIRCULAR SAW DRIVEN BY MOTORS MOUNTED ABOVE.

of dust, but in a well-designed installation this does not militate against the successful application of electric drive. An interesting installation of this nature is that at Mr. Geo. Shipway's Electric Sawmills, Camp Hill, Birmingham.

In this installation three-phase power at 25 cycles, 440 volts, supplied from the mains of the Birmingham Corporation, is distributed from an ironclad switchboard to a number of "Witton" induction motors of the open type, varying in size from 50 h.p. downwards. The mills are situated in one of the busiest parts of Birmingham, where space is valuable, and how the electric motor lends itself to compact arrangement is seen from the illustrations. Two of the motors are shown in Figs. 1 and 2 mounted on the ceiling, one driving a cross-cutting circular saw, while the other drives

FIG. 2.—A GROUP OF MACHINES DRIVEN FROM ONE MOTOR, COMPRISING BAND SAW, SAW SHARPENER, GRINDER, SPINDLE MACHINE.

a group of small machines consisting of band saws, saw sharpeners, grinders, and spindle machine. The other motors are installed in concrete pits directly below the machines they are driving. One works a circular saw seen in Fig. 3, a second a further circular saw, and a third a four-cutter machine trimming the four surfaces of the wood at the same time. In each case the controlling switchgear is situated close to the driven machine. The whole of the floor space

is available for the ordinary operations, and in no case is space taken up by belting or shafting. Mr. Shipway is emphatic as to the economy obtained by the introduction of electric driving into his mill, and regards as one of the most valuable features the ability to shut down those of the machines which are not in use, and, in addition, to run

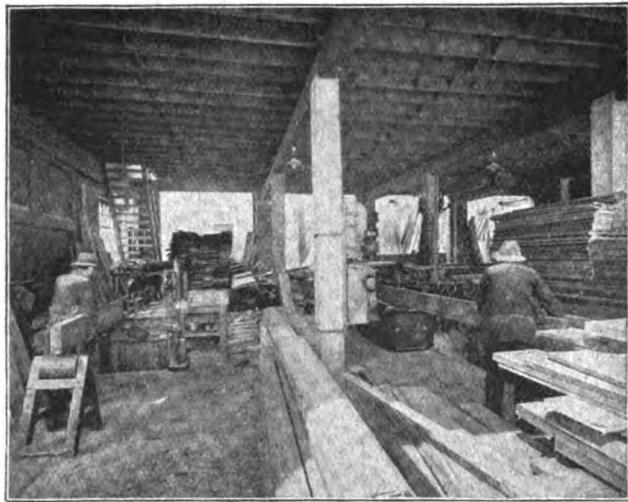

FIG. 3.—CIRCULAR SAWS DRIVEN BY MOTORS IN PITS BELOW.

one or more machines as desired through the breakfast-hour or on overtime should a pressure of work make such a procedure desirable. The whole of the electric plant for this installation was supplied by the General Electric Co., Ltd. (Witton, Birmingham, and 67 Queen Victoria Street, London, E.C.), who are indebted to Mr. Geo. Shipway for permission to send us particulars of the installation.

A BROKEN SHAFT AT BARKING

ON Tuesday last week, at about 4 p.m., the A.C. supply from the Barking Electricity Works was suddenly stopped by the breakage of a 5½-in. crank shaft. The machine upon which the accident occurred was a reciprocating set driving a 250-kw. D.C. set and a 250-k.v.a. A.C. set in tandem. Smoke was observed coming up from the alternator, and on the set being shut down it was found that the break had occurred on the edge of the end bearing of the engine, and that the bearing metal had melted. As the bulk of the supply from the Barking Electricity Works is D.C., and A.C. is only used for some power circuits, only part of the supply was crippled, but the A.C. consumers had to suffer, as the only other A.C. set is a 130-kw. motor-generator, which is not sufficiently large to take the maximum A.C. load. It will be seen, therefore, that the set which broke down was a very useful one, and, in fact, it has been running almost continuously. We learn that Messrs. Siemens Bros. Dynamo Works are lending a starting apparatus, which will enable the generators of the A.C.-D.C. set to be used as a motor-generator, and as there is at present enough D.C. capacity in the station, it is probable that by the time this note appears the supply at Barking will be quite normal. East Ham has also offered to supply the traction load if necessary, as the Barking and East Ham tramways join one another. As, however, there is a probability of the load increasing considerably during the next few months, owing to the requirements of works engaged on Government contracts, and four months will elapse before the repair to the engine is completed, the L.G.B. is being asked to sanction expenditure on new plant. Mr. W. E. Kidner, who is Acting Engineer and Manager of the works in the absence of Mr. W. Holmes, who is with the Army, will be responsible for the extensions.

REVIEWS OF BOOKS

We shall be pleased to post any of the undermentioned works to any address in the United Kingdom, Colonies, or Abroad at the prices given. Orders should be addressed to the Kilowatt Publishing Co., Ltd., 203-6 Temple Chambers, Temple Avenue, London, E.C., accompanied by a remittance.

Principles of Electrical Measurements. By A. W. Smith. 243 pp. 7½ in. by 5 in. 99 figures. (New York : McGraw-Hill Book Co.; London : Hill Publishing Co., Ltd.) 8s. 4d. net.

We can give our thorough endorsement to Prof. Smith's principles. They are clearly given, and the diagrams illus-

trating them are excellent. In some cases—for instance, in the chapters on the Wheatstone bridge—the author goes a little further than the title of his book might imply, and describes not merely the various methods of measurement, but their practical application to concrete cases, and this might with advantage have been developed throughout the book by giving details of the usual methods employed in the commercial testing of electrical machinery, apparatus, and circuits. A student whose knowledge of electrical measurements did not extend beyond the limits of this text-book would certainly not be able to make the reception tests of a generator or motor, and he might even feel "at sea" in the testing-room of a cable factory, for, while the loss of charge method of insulation testing is described, the more common "direct deflection" method is not deemed worthy of mention. Nor is the principle of the various ohmmeter insulator testing sets included. We are also surprised to see that the Kelvin double bridge is not described. Although the measurement of low resistances may now be more usually made by the simple ammeter and voltmeter method, yet the double bridge certainly has equal if not greater claim for recognition than the obsolete tangent galvanometer of "historical interest." One of the measurements described in the first chapter on the Wheatstone bridge is a method of localising the position of a break in a wire of a multiple telephone cable by comparing the capacity of the faulty pair to a sound pair by a bridge method, and it would be interesting to know whether the utility of this has been confirmed in actual practice, as the accuracy would appear to be considerably greater than with the usual method of comparing the discharge swings.

Electrical Instruments in Theory and Practice. By W. H. F. Murdoch and V. A. Oschwald. 336 pp. 7½ in. by 5 in. 164 figures. (London : Whittaker & Co.) 10s. 6d. net; abroad, 11s.

There is perhaps a little more of the theory than the practice in this book, which is addressed to "students in the higher classes" as well as engineers. The subject of damping is mathematically treated at some length before the principles of moving coil, iron cored, hot wire, and dynamometer type instruments are discussed. The action of various patterns of supply meters forms material for a considerable portion of the work, and the principal methods of magnetic testing are briefly recapitulated. The final chapter, somewhat ineptly named the Post Office Box, discusses resistance bridges, potentiometers, &c., but on account of the simplicity of the theory of their action, this part of the subject is rapidly passed over. Another volume on oscillographs and further A.C. instruments is promised. The work does not profess to deal with practical details of the instruments themselves, but is rather of value in inculcating and understanding of the problems underlying their action.

The Year Book of Wireless Telegraphy and Telephony, 1915. 800 pp. 8½ in. by 5½ in. 44 figures. (London : The Wireless Press, Ltd.) 3s. 6d. net; by post 3s. 11d.; abroad 4s. 6d.

In the 1915 issue, this valuable work of reference, published under the auspices of the Marconi Company, has been thoroughly brought up to date. It contains an interesting chronological summary of the development of wireless telegraphy, and reprints the last of the Radiotelegraphic Convention, and that dealing with safety of life at sea. The various laws and regulations in force in foreign countries are also dealt with, and complete lists of wireless stations are given, with an excellent map. Among the series of original articles is one by Mr. A. Hurd on "Wireless and War at Sea," while Col. F. N. Maude writes on the influence of wireless telegraphy on modern strategy. The technical articles include one from the pen of Prof. J. A. Fleming on "The function of the earth in radiotelegraphy," and a summary of progress in wireless telephony by Mr. H. J. Round. Dr. W. H. Eccles contributes an article on "Radiotelegraphic research in 1914," and other subjects dealt with include long-distance service, meteorology, and time signals. There is also a collection of biographical notices, and particulars of companies connected with wireless telegraph work, and a host of technical and statistical information.

The Arithmetic of Electrical Measurements. By W. R. P. Hobbs. Revised and edited by A. P. Palmer. 120 pp. 7½ in. by 4½ in. 20 figs. (London : T. Murby & Co.) 16th edition. 1s.; by post, 1s. 2d.

This book has fully deserved its fifteen editions. The present edition the sixteenth—has been revised by Mr. A. R. Palmer, and considerable additions have been made, including a practical chapter on curve plotting. While revising the work, however, it is to be regretted that a section was not also added on fall of potential calculations.

Electric Light Accounts and their Significance. By H. M. Edwards. 172 pp. 7*½* in. by 5 in. (New York: McGraw-Hill Book Co.; London: Hill Publishing Co., Ltd.) 8s. 4d. net.

The author is the auditor of the New York Edison Co., and therefore an authority on the subject, but the system described is directly applicable only to American conditions.

Improved Four-figure Logarithm Tables. By G. C. McLaren. 27 pp. 8*½* in. by 5*½* in. (Cambridge: The University Press.) 1s. 6d. net; by post 1s. 7d.

A set of tables of four-figure logarithms are arranged in very convenient form in 18 pages with a thumb index, and accompanied by clear and concise explanatory remarks as to their use.

Business Methods and the War. By L. R. Dicksee. 71 pp. 9 in. by 5*½* in. (Cambridge: The University Press.) 2s. net; by post 2s. 2d.

This is a reprint of four lectures given by the author (who is Professor of Accounting and Business Organisation in the University of London) at the London School of Economics. The first contains an interesting comparison of military and civilian methods of organisation, bringing out several fields where the one might with advantage learn from the other. In the second lecture a plea is put forward for training methods more nearly approximating to drill for improving efficiency in civilian occupations, while improvement in accounting methods is discussed, and other financial questions form the subject of the last. The work is most stimulating reading and is full of the soundest common sense, and is a welcome relief to the irresponsible and unpractical scaremongering style of writing only too prevalent just now.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,443.

What are the usual faults met with on three-core, paper-insulated, earth-shielded, and lead-covered cable supplying energy on the three-phase E.H.P. system with insulated neutral, the feeders being drawn in earthenware pipes?—"FLOTSAM."

(Replies must be received not later than first post, Thursday, May 27th.)

ANSWERS TO No. 1,441.

Are small continuous-current fan motors series or shunt wound, and why?

The first award (10s.) is made to "KOIL" for the following reply:—

It is impossible to predict accurately the performance of a fan owing to differences of trunk area and length, bends, &c., and it is therefore desirable that the motor driving the fan should, as far as possible, adjust itself to compensate for differences from the estimated conditions. For example, if the effective resistance of the trunk is higher than anticipated, at a given speed less quantity of air will flow, and consequently the load will be reduced, a higher speed being required to give the increased pressure necessary for the desired quantity of air. If the motor is series wound, the speed will increase until the load is such that the armature current is the same as the exciter current required for that

speed; whereas the speed of a shunt-wound motor will only increase very slightly. Conversely, if the resistance of the trunks, &c., is lower than anticipated, an excess quantity of air will flow, tending to overload the machine, but a series motor will automatically slow up, thus reducing the air pressure, and incidentally the quantity, until the current demanded by the load and that demanded for excitation is the same; whereas the shunt motor under similar circumstances would run at approximately normal speed and maintain the overload with the consequent dangers.

Very small series-wound motors, such as those used for desk and ventilating fans, are easier to construct and are better than shunt-wound motors, particularly if they are required for mediumly high voltages. The number of armature conductors required is less for a small series motor than for a shunt machine of the same dimensions, owing to the applied voltage across the armature being less, since there is quite a considerable drop voltage across the series field coils (as much as 20 to 30 per cent. of the line voltage in some cases). This permits the use of heavier wire on the armature, and, further, the field coils can be made of many fewer turns and of larger wire than if shunt wound—both important points on such small machines. If no speed control is required, or when the capacity of the sets is small enough for plain series regulation, the wiring for series motors is the simplest possible, only two wires being required between the motor and the switchgear and mains, whereas in a shunt motor three are required. For larger machines, however, when speed regulation is required, pure series control is, of course, most uneconomical, and it is often desirable from the point of view of efficiency to put in a larger motor, either shunt wound regulated by resistance in the field circuit or series wound with series-diverter control, in which case, of course, the wiring for the shunt motor is less expensive. It might be mentioned that speed reduction by series resistance is usually more economical for shunt motors than it is for series motors, but for small equipment this saving is quite counterbalanced by the other advantages obtained by using the series motor.

The second award (5s.) is made to "T. C." who writes as follows:—

Small continuous-current fan motors are series wound, and not shunt wound, for the following reasons:—If shunt wound, the field winding would be excited from the full-line voltage, whereas if series wound the field winding has only a portion of the line voltage between its terminals. The consequence is that the necessary ampere turns are got by using a larger wire with a series winding than with a shunt winding. Fewer turns are required, so the winding process is cheaper. The space factor will almost certainly be better, so more copper can be got into the winding space, leading to a possible increase of output or an improvement in efficiency. As the difference of potential between the terminals of the coils is less, the chance of breakdown is diminished. The price of copper wire goes up very rapidly, in the case of small diameter wires, as the diameter becomes less and less. Hence the copper for winding the coil is itself cheaper per pound, almost certainly sufficiently cheaper to make the coil itself cheaper in material, even though a greater weight of copper be used with the better space factor.

If shunt wound, the armature winding would be across the full potential, whereas if series wound the armature winding has only a portion of the full potential across it. Hence its back E.M.F. is reduced, which means that the number of turns required in its winding is reduced also. As in the case of the field winding, a larger wire is therefore required, giving exactly the same advantages as regards less cost of winding, space factor improvement leading to increased output or efficiency, less difference of potential between various parts of the winding, and less cost of material. If the question of commutation should be important, e.g., if the fans are for high voltages, the reduction in the number of turns helps greatly in this direction also.

As, presumably, only open-air fans are referred to, it is unlikely that great changes of load will occur, and hence, in practice, even the series-wound motors will run at very constant speeds. But even if the load should change owing to alteration of surrounding air paths and pressures, the series-wound motor will have the advantage over the shunt-wound motor that it will tend to run at a constant load. Should the pressure increase, its speed will diminish, thus giving the effect indicated. But a shunt-wound motor, with a more constant speed, would tend to become overloaded under the same circumstances. This is, however, a minor point; the important items are summarised above, and are those concerned with cost of production and reliability.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 13th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

17,889/13. **Switches.** A. HIRST and P. S. BROOK. Iron-clad switches in which the iron case is divided into two compartments, one containing the main working parts that periodically require attention, and the other the live terminals and an isolating switch operated from outside and interlocked with the main switch and the cover of the main compartment. (Four figures.)

9,123/14. **Conduit Joints.** SIMPLEX CONDUITS, LTD., and L. M. WATERHOUSE. Joints for conduit tubes and fittings in which an internally screwed and flanged sleeve is made by turning over the plain part of the sleeve after partially threading the interior. The bore at the end of the sleeve is enlarged before threading to give clearance for the tap, and so that space is provided for a bell mouth at the end of the tube to take its proper seating against the fitting. (Seven figures.)

9,554/14. **Cables.** C. J. BEAVER and E. A. CLAREMONT. Cables insulated with a mixture of vulcanised bitumen and vulcanised or unvulcanised rubber, gutta-percha, mucilaginous gum or gelatine, the latter ingredient forming from 5 to 15 per cent. of the whole.

9,637/14. **Telephones.** E. C. R. MARKS (*Electrical Experiment Co., U.S.A.*). Transmitters with rigid diaphragm lightly supported by pneumatic cushions exerting an aperiodic resilience, and permitting the diaphragm to vibrate as a whole in accordance with the sound vibrations. (One figure.)

9,856/14. **Traction.** B.T.-H. CO. and F. W. CARTER. A continuous-current traction system with an insulated return conductor connected to the track at intervals, and to dynamotors or motor generators having the driving armature windings connected in series with the outgoing line, and the generating armature windings in series in the return conductor. (Two figures.)

10,050/14. **Commentators.** W. S. PYRAH. The interposition of a layer of lead or other rigid material which flows easily under heavy pressure between the V-ring holding the bars and the surrounding insulation. (One figure.)

10,440/14. **Cables.** R. R. STELL. A cable comprising one or more insulated cores separated and surrounded by a covering of bitumen compound, and covered by a further coating of hard rubber.

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: PRICE and CALLENDER'S CABLE & CONSTRUCTION CO. [Cables] 8,842/14.

DYNAMOS, MOTORS AND TRANSFORMERS: B.T.-H. CO. (*G.E. Co., U.S.A.*) [Motor control] 10,531/14; MIDGLEY and VANDERVELL [Commutators] 14,861/14.

Electrometallurgy and Electrochemistry: LIPINSKI [Preparation of hydrocyanic acid by the electric arc] 11,107/14; STROHMENGER [Electric welding and fusion deposition of metals] 13,538/14.

Incandescent Lamps: GIMINGHAM [Incandescent lamps] 2,323/14.

Switchgear, Fuses and Fittings: TUCKER and CRABTREE [Switches] 9,558/14; COLLIS and CROMPTON & CO. [A.C. control gear] 10,822/14.

Telephony and Telegraphy: DE LANGE and FISCHER [Thermic telephones] 4,220/14; DIXON [Printing telegraph receivers] 10,716/14; LYLE [Telegraph transmitters] 10,775/14; WESTERN ELECTRIC CO. (*Woodward for W.E. Co., U.S.A.*) [Selective signalling system for party lines] 10,807/14.

Traction: INRIG and GAVAN INBIG, LTD. [Car lighting] 24,219/13; W. R. SYKES INTERLOCKING SIGNAL CO. and TARRANT [Signalling relay] 10,504/14; PETER [A.C. track signalling] 10,533/14, and [Electrically worked points and signals] 10,534/14; ALEXANDER (*Union Switch & Signal Co.*) [Point control] 10,938/14; BRETTELL (*Apple Electric Co., U.S.A.*) [Car lighting] 20,168/14.

Miscellaneous: GOWER [Indicating speed ratio of co-related rotors or shafts for facilitating control of transmission] 5,843/14; PARSONS and BALL [Clocks] 10,015/14; DAVIS and

RAILING [Mine signalling relays] 10,549/14; BRISTOL [Miners' lamps] 11,599/14; JOHN DAVIS & SON, LTD., and DAVIS [Colliery signalling] 11,780/14; KROPP [Impulse-producing mechanisms] 12,913/14; GEHR. SULZER [Governors for internal-combustion engines having electric power transmission] 13,706/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Switchgear, &c.: GILES [Switches] 5,943/15.

Telephony and Telegraphy: ROUZET [High-frequency generators] 5,955/15.

The following Amended Specification can now be obtained:—
Telephony: D. H. KLEIN and J. W. TURNER [Exchange working] 6,369/13.

Opposition to Grant of Patents

4,655/14. **Ignition.** A. CHRISTMAS. Opposition has been entered to a grant on this specification, which describes a combined ignition coil and lamp for automobiles.

Expiring and Expired Patents

The following Patent expires during the current week, after a life of fourteen years:—

10,505/01. **Storage Batteries.** T. A. EDISON. Batteries with an alkaline electrolyte having anhydrous ferrous oxide in the negative electrode and a depolariser of non-colloidal hydrated oxide of nickel in the positive electrode. The active material is rendered more conducting by the presence of flakes of graphite, and is contained in perforated receptacles, of which some of the constructive details are covered by this patent.

10,733/01. **Oil Switches.** B.T.-H. CO. This specification describes constructive details of a pattern of oil circuit breaker for hand operation and automatic release.

The following are the more important Patents that have become void through non-payment of renewal fees.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: J. S. HIGHFIELD [H.T., D.C. distribution] 1,946/06.

DYNAMOS, MOTORS AND TRANSFORMERS: B.T.-H. CO. (*H. F. T. Erben*) [Brush holders] 2,666/02.

Ignition: H. A. HUMPHREY [Contact maker actuated by compression] 2,509/07.

Incandescent Lamps: B.T.-H. CO. (*G.E. Co., U.S.A.*) [Machine for flashing filaments] 2,456/04; H. ZERNING [Preparation of metal filaments from hydrides and nitrides] 2,554/06.

Switchgear, Fuses and Fittings: A. P. & G. C. LUNDBERG [Tumbler switches] 2,251/03; A. LOEBL and BRITISH EVEREADY ELECTRIC CO. [Switches] 1,963/07; A. S. MOORE [Pendants with tilting shades] 2,197/08; W. GREEN [Lamp-holders] 2,106/09.

Telephony and Telegraphy: M. KOTYRA [Perforators] 2,542/06; J. SCHISSLER [Arc system of wireless telegraphy] 1,848/08.

Traction: E. F. W. ALEXANDERSON [Control of A.C. and D.C. motors] 1,773/08; R. A. DAWBARN [Trolley-wire suspension] 2,311/09.

Miscellaneous: F. W. CLARK and KELVIN & JAMES WHITE, LTD. [Magnetic compass] 2,351/02; M. WILLET [Electrical route indicator] 2,046/06.

The German Electrical Industry.—Our Copenhagen correspondent writes:—It is wrong to say that the industry in Germany is disorganised. In my opinion, it has never been so organised as at present, but the whole organisation has been altered to meet the war requirements. The Government has taken over practically the whole supply of brass and copper and other metals useful for war purposes. A vast number of factories are working day and night on Government orders, and, as the German Government pays tremendous prices, the firms, having this sort of work, do not care for any other. However, in the electrical industry there are a large number of small firms, especially down in the Thüringen neighbourhood. Most of these firms have no Government work, but they cannot supply the usual accessories because all their stock of metals have been taken from them. Therefore they now make lamp-holders, lamp sockets, switches, and, in fact, gradually all accessories, of brass-covered iron. With their usual technical thoroughness and cleverness they have succeeded in producing an article of first-class quality. The finished article looks exactly like brass, can be polished like brass, and, I believe, withstands moisture and other rough treatment. For a long time the Germans have been using insulated iron wires instead of copper wires.

ELECTRIC TRACTION NOTES

On p. 176 of our issue for April 22nd, we referred to a "late" Bill which had been introduced with the object of giving to the Underground Electric Railways of London and the London General Omnibus Co. statutory powers with regard to interchange of traffic and the pooling of funds. Reporting upon this Bill, the Parliamentary Committee of the London County Council expresses doubts as to whether the proposals are in the interests of the public. It is argued that under the conditions which it is now proposed to introduce, traffic routes could be abandoned in the financial interest of the companies to the detriment of the public, whereas at present, as each separate undertaking is on a self-supporting basis, this cannot be done. Objection is also taken to giving the London General Omnibus Co., which is not a Parliamentary concern, statutory rights similar to those to be conferred upon the railway companies. The Council is to oppose the Bill in Parliament.

On Friday a strike of the drivers and conductors on the London County Council tramways took place in consequence of the refusal of the Highways Committee to grant to all grades an increase of one shilling per day to meet the extra

cost of living. The trouble spread, and by Monday a good number of the men on the cars run outside London by the Metropolitan Electric Tramways, Ltd., joined the L.C.C. strikers. A few weeks ago the Highways Committee agreed to a war bonus of 3s. per week being granted for three months to employees earning less than 30s. per week, and later extended the period to November. So far as motormen and conductors are concerned, an agreement is in force, and expires on July 30th, and the Highways Committee contend that then is the right time to raise the question. On the other hand, the men say that the war conditions justify them in ignoring the agreement, and at the same time they make complaints of their conditions of work, which the shortness of staff, due to the war, has rendered inevitable. At the time of going to press all steps which have been taken to bring the strike to an end have been abortive, and the intervention of the Board of Trade has been ineffective.

At a meeting of the Croydon Corporation on Monday, the following resolutions passed at a Conference of the Managers of the Tramways Undertakings within the Metropolitan area on the 7th inst. were adopted:—“(1) That tramways revenue cannot be improved by increasing fares generally. (2) That joint action should be taken by the tramways authorities in the Metropolitan area to obtain more equitable treatment for tramways in respect of rates and the upkeep of the roads. (3) That powers should be obtained to jointly run omnibus services.” The Council is asked to approve these resolutions.

"ELECTRICAL ENGINEERING" TRADE SECTION

THE LIGHTING OF A MUSIC HALL

THE standard of illumination of places of amusement has been greatly raised of late, and a good example of a modern installation of this nature is found in the Finsbury Park Empire, of Moss's Empires, Ltd., the interior of which is illustrated here. The methods adopted form a great con-

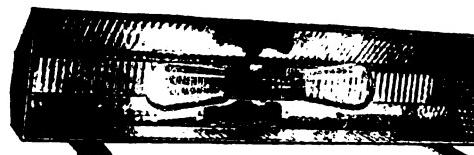

INTERIOR OF FINSBURY PARK EMPIRE.

trast both in artistic effect and sufficiency of lighting to the primitive arrangements of the earlier days of electric lighting. The hall is lighted throughout with Mazda drawn-wire lamps, and a beautiful effect is produced by the employment of the well-known "Veluria" white glass reflectors of the British Thomson-Houston Co., Ltd., Mazda House, 77 Upper Thames Street, E.C.

SHOP WINDOW REFLECTORS

SIMPLEX Conduits, Ltd. (Garrison Lane, Birmingham), have just produced a range of reflectors designed to illuminate the object displayed in shop-windows in the most economical manner. These reflectors throw all the light upon the goods—where it should be; none in the eyes of the observer. They prevent the pavement in front of the shop being flooded with light, thus meeting the requirements of scientific illumination, appealing to one's common sense and at the same time falling in with the new lighting

regulation. All the reflectors are designed for easy wiring and fixing, and at the same time are easily adjustable. A new leaflet has been issued describing this range fully, and

REFLECTOR FOR SHOP-WINDOW LIGHTING.

a copy will be sent on application to any of the Simplex Co.'s branches. One of the numerous patterns is illustrated here. This is arranged for screwing direct to the woodwork of the bottom or side of a window. It is lined with fluted mirror glass, and fitted with a special twin lampholder.

CATALOGUES, PAMPHLETS, &c., RECEIVED

SWITCHGEAR, &c., FOR WAR SERVICE.—Reyrolle & Co., Ltd. (Hebburn-on-Tyne), are making a special effort regarding the prompt supply of apparatus to firms engaged in the manufacture of war supplies, and carry large stocks of completed standard parts which can be built up into the desired forms of switchgear without delay, and are reserved for war service orders only. In this connection they are issuing a special series of leaflets describing their standard armoured draw-out pattern switchgear, in explosion-proof and other forms, low-tension ventilated self-aligning fuses, cast-iron distribution boxes, watertight plugs and sockets, earthed plugs and sockets, ironclad switches, oil break switches, &c. Our readers are familiar with many of these excellent designs, in which particular attention has been given to the Home Office recommendations as to safety, and the mechanical robustness which is essential to reliability.

CONDUITS AND FITTINGS.—Simplex Conduits, Ltd. (Garrison Lane, Birmingham), have just published a new edition of those sections of their catalogue dealing with conduits, conduit fittings, distribution boards, fuses, switchgear, watertight fittings, and cables. The list has been rearranged in a new form of very convenient size, and many new fittings and devices make their appearance. The whole arrangement of the list is such as to facilitate ready reference, and the well-thought-out methods of tabulation employed, which have always been a strong feature in the Simplex publications, greatly enhance its utility, and enables a very large amount of apparatus to be included within the limits of a compact volume.

PORTABLE ELECTRIC TOOLS

SEVERAL patterns of portable electric tools are described in a leaflet which has been issued by the Sun Electrical Co. (118-120 Charing Cross Road). One is an electric grinder with self-contained direct-coupled motor, which can be mounted on the slide-rest of a lathe. The whole apparatus weighs only 8½ lb., and the motor runs at 10,000 r.p.m., which gives the small diameter emery wheel the best surface speed. This grinder should be useful for a variety of work, and has a long "snout" so that it will grind out holes up to 4 in. deep. It is also suitable for a variety of external work, and should be a useful adjunct to any tool-room.

Fig. 1 shows a new design of portable drill of particularly

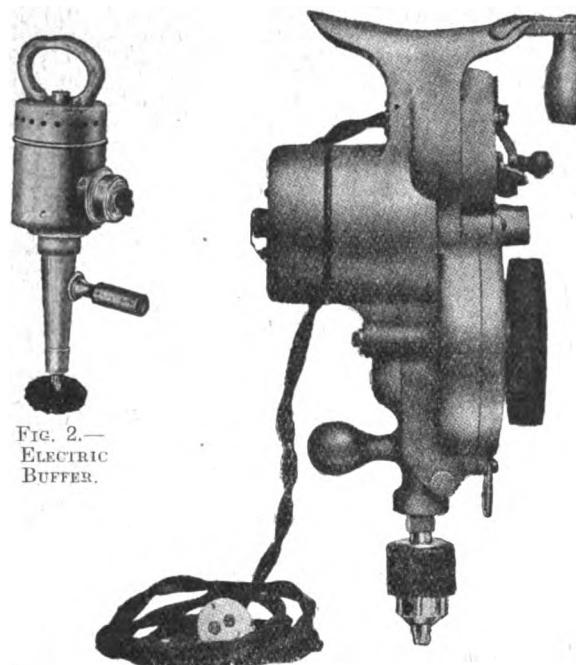

FIG. 1.—ELECTRIC DRILL.

convenient form to handle. The switch is placed close to the upper handle, and starts, stops, or reverses the motor with one lever. A special feature is that in which an emery wheel can be attached to the gear shaft, so that drills, &c., can be ground on the machine itself. Another ingenious detail is a device by which the drill spindle can be thrown out of gear by swinging out the bearing carrying it, and locked for tightening up the drill chuck. This tool weighs 11 lb., and can be used for drilling up to 3/8 in. and tapping up to 3/16 in.

Another useful tool for buffing and also grinding work, too large to be taken to ordinary machines, is shown in Fig. 2. This has extensive application in motor-car work, such as for buffing brass work. The motors driving all these tools can be run from either D.C. or A.C. circuits.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Barnsley.—The Corporation has approved of a scheme for extending the plant at the power station at an estimated cost of £21,850. During the course of a discussion on the scheme, it was stated that Mr. E. A. Barker, the Borough Electrical Engineer, is with the Army in France.

Bristol.—The Corporation has sanctioned an expenditure of £26,949 upon a new 6,000-kw. turbo-alternator, with the usual accessories, for the Avonbank power-house. At present there is only about 1,000 kw. of spare plant, which is not considered sufficient. With the new set, and taking into account all the new connections contracted for, the spare will be 3,514 kw., or practically the capacity of one of the larger generating sets.

Carnarvon.—The Council, having applied for a loan of £500 for mains extensions, has been asked by the Local Govern-

ment Board to postpone the matter until after the war. As, however, the mains are principally in connection with the tuberculosis hospital, it is felt that permission should be granted, and a note to this effect has been sent to the Board.

East Sussex.—The East Sussex Rural District Council has decided to instal a small additional generating set to the plant at the asylum. This is regarded as more economical than renewing the whole of the existing battery. An expenditure of £900 has been authorised.

Leigh.—The Corporation has received an intimation from the Local Government Board that the application for borrowing powers for extensions to the plant at the power station has been approved without holding the usual local inquiry. This is the result of action by the Corporation following on the receipt of a letter from the Director of Navy Contracts, asking for an explanation of a complaint made by the Anchor Cable Co. that delay in completing Navy contracts was due to difficulty in getting supplies of electricity.

Wigan.—An expenditure of £1,200 is to be incurred for transformers, switchgear, and cable for supply to the Pember-ton Colliery Co.

Wiring

London: L.C.C.: Hackney.—345 wiring points, S. Hackney County School. June 4th. (See an advertisement on another page.)

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Bootle.—New school.

Bristol.—Labour Exchange, Colston Avenue. H.M. Office of Works, London.

Chadderton.—Smallpox hospital (£11,000). Lancs. County Council.

Rochdale.—Sanatorium (£18,900).

Miscellaneous

Manchester.—Twelve months' supply of electrical accessories, including lamps, wire insulators, &c. Secretary, Electricity Department. May 26th.

North Staffs Railway Co.—Twelve months' supply of electric lamps and fittings. Secretary, Stoke-on-Trent. May 22nd.

South Indian Railway Co.—Tenders are invited for electric lamps. Managing Director, 91 York Street, Westminster, S.W. May 26th.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Aldershot.—The tender of C. A. Parsons & Co. for a turbo-alternator at £4,793 has been accepted.

Dover.—The Corporation has decided to introduce electrically-driven vehicles for dealing with the whole of the scavenging of the town. Edison Accumulators, Ltd., are to have the contract, and a considerable annual saving over the present arrangements by which horses are used is contemplated. Edison Accumulators, Ltd., guarantee the batteries to maintain their rated capacity after running 60,000 miles.

Edinburgh.—The tender of the Stirling Boiler Co. for water-tube boilers amounting to £92,000 is recommended for acceptance by the Electricity Committee.

Iford.—A contract has been placed with Edison Accumulators, Ltd., for a 4-ton electrically-driven wagon.

Pontypridd.—A contract has been placed with Siemens Bros. Dynamo Works for a twelve months' supply of Tantalum lamps.

Winchester.—An order has been placed with C. A. Parsons & Co. for a 500-kw. turbo-generator set at £3,991. A considerable reduction in working costs is anticipated from the use of this set. With the present plant 10,000 lb. of steam generates 400 units, whereas with the new plant the number of units generated with the same quantity of steam will be 530.

Messrs. Venner & Co. have received contracts for twelve months' supply of Chamberlain & Hookham meters from the Dundee and Swansea Corporations and the Battersea Borough Council. The Southwark Council has placed a similar contract for prepayment meters.

APPOINTMENTS AND PERSONAL NOTES

Sir Edgar Speyer, Bart., Chairman of the Underground Electric Railways of London, having resigned his seat on the Board, Lord George Hamilton, Deputy Chairman, has been appointed to succeed him.

Mr. J. Scrivener has resigned his position of Director and Manager of Krupka & Jacoby, Ltd., and has been appointed to control the sales organisation of the "Z" Electric Lamp Co., Ltd. Before leaving, Mr. Scrivener was presented by his co-directors with a gold watch, and by the staff with a suit-case.

Mr. Percy Taylor, Assistant Borough Electrical Engineer, Darwen, has joined the motor transport service.

A shift engineer is required at Ayr for the period of the war. (See an advertisement on another page.)

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. Geo. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £87 10s. to £88 10s. (last week, £88 to £89).

Agencies.—The Peninsula Engineering Co., Ltd. (Suffolk House, Laurence Pountney Hill, E.C.), have been appointed sole agents for Luis Berenguer & Co., Ltd., Barcelona, makers of porcelains for electrical purposes.—A firm in Odense (Denmark) desires to represent British manufacturers of transformers, high-tension insulators, insulating materials, watertight fittings, tumbler and ironclad switches, ammeters, and voltmeters. Further particulars at 73 Basinghall Street, E.C.

Change of Address.—The Glasgow office of Messrs. George Ellison is now 227 St. Vincent Street, instead of Caledonian Chambers, Union Street.

COMPANIES' DIVIDENDS, REPORTS, MEETINGS, &c.

Callender's Cable & Construction Co.—The net profit for 1914 was £98,692, against £91,862 for the previous twelve months. A dividend of 15s. per share on the ordinary shares (including a 5s. bonus) is recommended, as in 1913. The amount carried forward is £163,169. During the year the company received important contracts in connection with the British telephone system.

Electric Construction Co.—The net profit for the year to March 31st, 1915, after providing £6,800 debenture interest and £5,000 depreciation, is £35,567. A dividend of 6 per cent. for the year on the ordinary shares is recommended, carrying forward £7,471, after transferring £17,402 to general reserve. The directors report a good general demand for electrical machinery, which has been enhanced by special orders arising out of the war.

South Wales Electrical Power Distribution Co.—The Treasury has sanctioned an issue of £80,000 prior lien debenture stock.

LOCAL NOTES

Batley: *Extensions Held Up.*—Owing to the impossibility of obtaining the necessary loan, the Corporation has abandoned, for the time being, the laying of cables to certain districts where a considerable demand for current has arisen.

Blackburn: *Decreased Revenue.*—The Borough Electrical Engineer, in his annual report for the year to March 25th, 1915, states that whereas during the first few months of the year there was noteworthy and exceptional progress, after the outbreak of war there was a serious setback, and the

weekly output for all purposes has since shown a consistent decrease on last year's figures—a condition of affairs which he fears will continue. Further progress on the new power station has been deferred by the refusal of the Treasury to sanction loans for purposes not directly required for the war. Having regard to the increase in price of all materials, particularly coal, Mr. Wheelwright states that early consideration may have to be given to the question of increasing the revenue. The net profit for the year was £2,348, against £4,687 in the previous twelve months. Thirty per cent. of the men in the department eligible for service have joined the colours, and the further enlistment of men responsible for the maintenance of supply is deprecated.

Bradford: *Profits and Rate Aid.*—The Chairman of the Finance Committee, in his annual budget statement last week, said that the approximate profit of the electricity undertaking for the year 1914-15 was £12,000, of which £7,000 had been spent upon plant. The balance of £5,000 made the available total credit of the department £22,500, and from this he proposed to appropriate £7,500, as compared with £5,000 in the previous year. The profit of £12,000 is about £2,500 less than in 1913-14, but in view of the general conditions the result is considered satisfactory.

Carnarvon: *Suspension of Sinking Fund.*—The National Electric Construction Co., which guarantees the capital charges on the money borrowed for the Council's electricity undertaking, has suggested that an application should be made to the Local Government Board for a suspension of the sinking fund during the war. The Council, however, does not agree with this, on the ground that so far the Carnarvon undertaking has not suffered owing to the war.

Hertfordshire: *Electric Power Supply.*—The County Council has informed the London County Council that it will oppose any electric power supply scheme promoted by the latter which includes any part of the County of Hertford, and which interferes in any way with the purchasing rights of any local authority in that area.

London: *Islington: War Badges.*—Mr. G. A. Touche, M.P. for North Islington, recently asked in the House of Commons as to the desirability of issuing war badges for employees in electrical stations. According to the *Islington Gazette*, Mr. Touche moved in the matter at the suggestion of Mr. Albert Gay, the Borough Electrical Engineer.

Stafford: *Electricity Profits.*—The revenue of the electricity undertaking last year was £7,193, or £814 over that of the previous twelve months. The expenditure decreased by £372, and after placing £1,000 to depreciation, a balance of £342 remains.

Stalybridge, &c.: *Joint Board Dissension.*—An interesting point relating to the rights of the constituent members of the Stalybridge, Mossley, Hyde, and Dukinfield Joint Electricity and Tramways Board came before the House of Lords Committee last week. By the Act which constituted the Board, the whole control of the electricity and tramway undertakings in these four towns was passed over to the Board. This session the Board decided to promote a Bill for powers to supply electricity outside the area of the four towns. To this proposal some of the Dukinfield representatives on the Board objected, and the Dukinfield Corporation presented a petition against the Bill. The Committee decided, however, that in effect the Dukinfield Corporation was a promoter of the Bill under the terms of the Act which incorporated the Joint Board, and could not, therefore, oppose the Bill. A *locus standi* was consequently refused.

Swansea: *Street Lighting Scheme.*—A scheme of street lighting, estimated to cost £1,500, has had to be deferred owing to the impossibility of obtaining a loan, and to the fact that the reserve fund is not considered sufficient to deal with the scheme.

Water-softening Plant.—The new Regent Palace Hotel is equipped with water-softening plant for the hot and cold water supply to the bedrooms, as well as for the kitchens, boiler-house, and heating system, carried out by Messrs. Lassen and Hjort.

SUMMARY

PROGRESS has been made with the formation of the Engineering Institutions Volunteer Training Corps. A meeting of those joining was addressed by Sir John Snell and Lieut.-Col. Clay at the Institution of Electrical Engineers last Thursday (p. 224).

A BADGE will be issued to members of the Electrical Emergency Service on taking up their duties (p. 224).

LAST Thursday a deputation of representatives of electricity and gas works attended before the Coal Exports Control Committee (p. 224).

AN electric supply station with Diesel engine-driven plant has been recently inaugurated at Karachi, India. Overhead distribution is used exclusively, and special precautions are taken against sea spray and sand storms (p. 225).

A NEW system for motor control employing a "lock-out" contactor is described (p. 226).

SOME interesting points regarding the lighting of rifle ranges were raised at a discussion last week by the Illuminating Engineering Society (p. 227).

THE rubber-insulated iron wires and cables in Germany have already been prohibited there, as the stiffness of the wire breaks the reclaimed rubber insulation when handled. Either zinc wires insulated with reclaimed rubber, or iron wires insulated with paper and metal cased may be used (p. 227).

THE inherent regulation of alternators is discussed in our Questions and Answers columns (p. 228).

A SPECIFICATION for an arc lamp with tungsten electrodes in an inert gas was among those published by the Patent Office on Thursday. Other specifications dealt with cable joints, traction, protective gear, commutators, and electrochemistry. Three patents connected with electrodes for alkali manufacture, and one for electric fuses for explosives, expire this week after a full life of 14 years (p. 229).

THE Treasury is allowing the Manchester Corporation to proceed with the Barton power scheme; two 5,000 kw. turbo-alternators and condensing plant are required at Edinburgh; mains at Walsall and Burton; various electrical material in Australia; and electrical supplies by a South Wales colliery company (p. 230).

THERE was a profit of £8,406 on the Salford electricity undertaking last year, compared with £3,629 in the previous year.—Coal clauses are to be inserted in all bulk supply contracts in future at Walsall.—A £39,000 scheme of extensions has been completed at South Shields (p. 230).

Arrangements for the Week.—(To-day) Thursday, May 27th.—Institution of Electrical Engineers. Annual General Meeting, 8 p.m.

Friday, May 28th.—Physical Society of London, at King's College, London. The list of Papers to be read includes one on "High Permeability in Iron," by Prof. E. Wilson. 8 p.m.

London Power Supply.—A conference of the municipalities and electric supply companies involved in the power scheme of the London County Council was held in London on Tuesday, at the instance of the L.C.C. Mr. G. H. Hume, Chairman of the L.C.C. Highways Committee, presided. A resolution was passed to the effect that the L.C.C. should not deposit or in any way proceed with an Electricity Supply Bill without giving the Borough Councils an opportunity of discussing it first, and it was also decided that a Committee should be formed including company representatives. A previous resolution by the Hammersmith Borough Council with regard to a linking-up scheme was not passed.

Confiscation of Mexico Tramways Co.'s Undertaking.—The directors of the Mexico Tramways Co., in a circular to the shareholders, describe the serious position in which the Company's affairs in Mexico are. The Company is interested in the Mexican Light & Power, the Mexican Electric Light Co., and the Pachuca Light & Power Co. So far as the tramways are concerned, the authorities have now seized these, and after working them for a short while, eventually closed the system down, apparently owing to the bad state of repair into which the rolling stock was allowed to get. Communication with the Company's officials is practically cut off. The authorities, however, have not yet taken over the control of the Mexican Light & Power Co., the Mexican Electric Light Co., and the Pachuca Light & Power Co., but the employees have had to be given higher wages. Simultaneously with this the receipts are practically only on paper and, further, the rate of exchange has deteriorated so that the peso is now not more than 5d., as against the normal rate of 25d. In addition, the Government owes a considerable sum on account of public lighting, which the Company has not been able to collect. At the same time, the Company has been compelled to maintain the public lighting and has had to import carbons, &c., and to pay for them in gold.

ENGINEERING INSTITUTIONS VOLUNTEER TRAINING CORPS

AT the Institution of Electrical Engineers on Thursday, a meeting was held in connection with the proposal to form a Volunteer Training Corps from those members of the Institution who are precluded by age or other good reasons from joining the active forces. Sir John Snell (President) was in the Chair and with him were Lt.-Col. C. B. Clay (formerly of the 8th Lancs. Artillery Volunteers) and Mr. H. C. Gunton, who is Commandant of the Post Office Signal Corps and also Staff Officer to General Sir O'Moore Creagh (Military Adviser to the Central Association of Volunteer Training Corps).

SIR JOHN SNELL said that extremely good results had been received from the circular which had been sent out a short time ago; 212 replies had come in, and 88 men had signed the enrolment form, whilst 68 members were doubtful as to the attitude they would take up. Lt.-Col. C. B. Clay, who held the volunteer decoration and was at one time second in command of the 8th Battalion of the Lancs Artillery, had been selected by General Sir O'Moore Creagh as Commandant of the proposed volunteer corps. [Applause.] Commandant Gunton, who had been an officer in the Royal Engineers Territorials, had formed a Post Office Volunteer Signal Corps, which at present consisted of 500 members, and they would hear shortly that Commandant Gunton had been good enough to offer certain facilities to the battalion which it was now proposed to form. It was also hoped that other institutions would join in and make up a big engineering unit. So far as he himself was personally concerned, Sir John expressed his extreme regret that for the moment he could not join in the drills, as his time was so much taken up with Institution matters and matters of a Government nature, that it left him very little even of his Saturdays and Sundays. Later on efforts would be made to form similar bodies in connection with the local sections. Already the Birmingham Electrical Volunteer Corps had been formed, and was doing good work. Finally, he pointed out that whilst the Institution was in no way responsible for the unit about to be formed, he could give the assurance that the Council would give practical sympathy and assistance in the matter of obtaining any of the apparatus that might be required. Probably, as there were among those present representatives of many manufacturers, there would be no difficulty in getting this apparatus.

Before Sir John Snell left the meeting Col. Clay proposed, and it was carried unanimously, that Sir John Snell be asked to accept the position of Honorary Commandant of the Corps.

SIR JOHN SNELL expressed his great surprise at this honour, and said that it afforded him the greatest pleasure in accepting it; at the same time he hoped before long to be able actually to drill with the members.

COL. CLAY, addressing those present, said that General Sir O'Moore Creagh had expressed the opinion that engineering units were of the greatest possible importance to volunteer corps. It was proposed to carry out work in connection with searchlights, emergency work in power stations, signalling, the running of emergency lighting sets, and transport work. With regard to wireless, he thought that for the moment this would have to be put on one side, as even the Post Office Corps was prevented from doing this work. At present, wireless work was absolutely prohibited practically all over the country. Mr. Gunton had received a letter from the Adjutant of the Birmingham Electrical Volunteers Corps, who stated that this Corps had a membership of 400 with an average muster of 200, and this showed what ought to be possible in London. It was not proposed necessarily to restrict the Corps to members of the Institution, and 30 or 40 men who had been drilling together elsewhere for some time, and who were mostly engineers, had asked to be allowed to join. With regard to premises for drilling, Commandant Gunton had kindly offered the Inns of Court Hotel, and also suggested that the Corps might drill in Gray's Inn Square, where the Post Office Volunteers also drilled. Both Commandant Gunton and his Adjutant, Mr. G. F. Preston, had been good enough to offer all the facilities at their disposal, and to find instructors at the beginning. It was also possible that the Corps might be able to drill at the City of London School. Further, Lt.-Col. Le Rossignol, the officer in charge of the London Electrical Engineers Territorials, had offered the headquarters of that body at Regency Street, Westminster, whenever they were available. Some of the members of the Institution who proposed to join the new Corps were at present members of infantry corps, and had wished to retain their dual membership. Col. Clay was, however, afraid that this would not be possible, and that the principle of "one man one corps" must be maintained. It had also been suggested that parties from the new corps might be sent to train with the regulars or territorials at week-ends, but a bar to this was the absence of any oath for members of Volunteer Training Corps. Personally, he was in favour of

an oath being taken, not because he doubted the honour of any of the members, but merely in order to facilitate training with the regular forces. Without the oath, difficulties arose from allowing bodies of unworn men to train under martial law as was the case with the regulars or territorials. So far as finances were concerned, he suggested an entrance fee of 5s. and a subscription of 5s. per quarter. With regard to uniform, Commandant Gunton informed him that the Post Office Engineers had been able to obtain theirs at 25s. a man. Probably the Post Office had special facilities, and, if another 5s. were added to that cost, it would probably meet the case. As to the work which would be covered, it was proposed to have squad drill, company drill, and he hoped ultimately battalion drill, and a very wide choice of technical work had been given them by General Sir O'Moore Creagh. The Post Office Corps had taken over telegraph and telephone work, but there would be plenty to do for the Corps in the directions he had already indicated, and there would also be mining, trench work, wire entanglements, and so on. The members might also be detailed for use for such work as lighting camps, in connection with which he had heard of difficulties having arisen.

Mr. Gunton then added a few words, after which questions and suggestions were invited from those present, and Col. Clay intimated that he would endeavour to arrange for the first drill in about a fortnight's time.

Readers wishing to join the Corps should communicate with Lt.-Col. C. B. Clay, Marconi House, Strand, W.C.

THE ELECTRICAL EMERGENCY SERVICE

WE want every electrical engineer in London who will give at least either four hours a day of his spare time, or four hours on alternate nights, to become enrolled in the Electrical Emergency Service. This Service is to fill the gaps caused by men who are leaving, or have left, to join the Army and to make munitions of war.

We have many names on our register already, but not enough to meet the emergency demand which is certain to occur during the next few weeks in view of Lord Kitchener's appeal for 300,000 more men.

Moreover, it is the *good* men we most want: for instance, men over military age who have filled or are filling good positions in the electrical profession, who have arrived at the stage when they might normally take things a little easier after the strenuous life which this profession always imposes on its devotees, but who are willing now to defer their rest a little longer in view of the national emergency.

A badge is being issued to members of the Service on their taking up their duties.

Applications for enrolment, on the form on p. vii., should be sent to the Editor of ELECTRICAL ENGINEERING, 203 Temple Chambers, London, E.C., who will be pleased to reply to any inquiries for further information, and from whom also further application forms may be obtained.

COAL SUPPLIES

ARISING out of the National Conference on Coal Supplies to Gas and Electricity Undertakings, a deputation attended before the Coal Exports Control Committee on Thursday last, and laid the views of the Conference before them. The deputation consisted of Sir Corbett Woodall, Past-President of the Institution of Gas Engineers and Governor of the Gas Light & Coke Co.; Sir John Snell, President of the Institution of Electrical Engineers; Alderman Phillips, Chairman of the Salford Corporation Gas Committee; Alderman Kay, Chairman of the Manchester Corporation Gas Committee; Mr. Frank Bailey, Chief Engineer of the City of London Electric Lighting Co., Ltd.; Dr. Charles Carpenter, Chairman of the South Metropolitan Gas Co.; Bailie Smith, Chairman of the Glasgow Corporation Electricity Committee; Mr. Regd. Neville, M.P., Chairman of the Brentford Gas Co.; Mr. Hanbury Thomas, Managing Director of the Sheffield Gas Co.; Mr. J. S. Highfield, Chief Engineer of the Metropolitan Electric Supply Co.; and Mr. D. Milne Watson, General Manager of the Gas Light & Coke Co.—It was stated in yesterday's Standard that a conference of Members of Parliament is to be convened to insist upon further Government action to secure reduction in price.

ELECTRIC SUPPLY AT KARACHI, INDIA

THE electric supply scheme which has recently been inaugurated at Karachi has several points of interest, and is a good example of progress which is being made with electrical enterprise in India. Karachi is a port handling a considerable volume of trade, a growing commercial centre, and is likely to rise in the future to the important position as the terminus of the railway route from Europe. At present a town of over 160,000 inhabitants, it has been until now without public electricity or gas supply. The inception of the scheme is due to the Hon. M. de P. Webb, of the firm of Forbes, Forbes, Campbell & Co., Ltd., who applied for the necessary licence under the Indian Electricity Act, and raising the capital entirely in India, formed the Karachi Electric Supply Corporation, seven out of the nine directors of which are Indian gentlemen. This Company, with the assistance of their consulting engineers, Messrs. Handcock & Dykes, carried the scheme into effect with great success. The contractors for the equipment were Messrs. Crompton & Co., who were connected with the scheme from an early stage. It may be remarked here that the particularly fair provisions of the Indian law, more especially as regards the definition of a fair market price at which the undertaking is purchasable by the municipality, greatly facilitated the inception of the scheme. At the start a contract was obtained for public

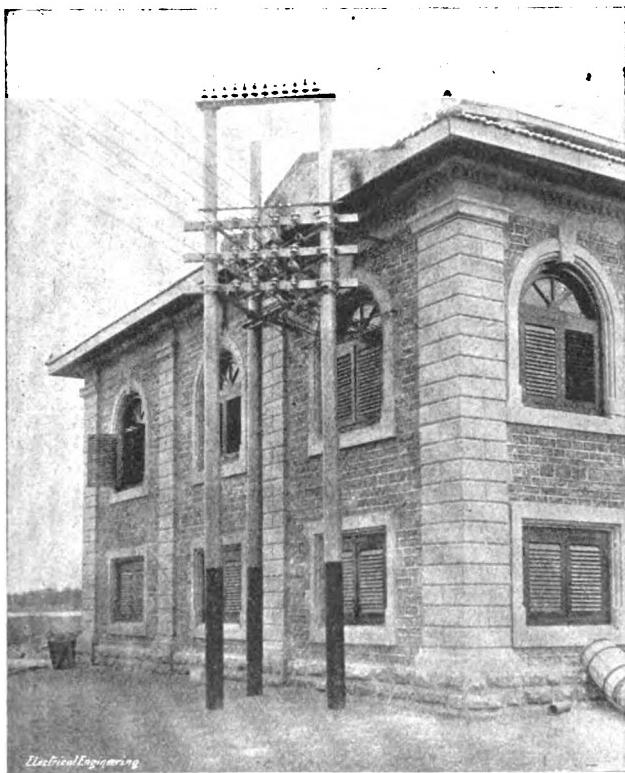

FIG. 1.—OUTGOING FEEDERS AT STATION.

lighting which had formerly been carried out mainly by Kitson oil lamps, and a considerable fan load was assured.

The site selected for the generating station is in Elander Road, close to the railway, and with ample space for extensions, and the general scheme is three-wire continuous-current supply from Diesel engine-driven plant, assisted by a battery. Although it is possible that future extensions, when the load is not only larger but more extended in area, may be carried out with alternating current, it was considered a sounder commercial proposition to employ continuous-current working during the initial stages.

The town is not only near the sea, but the subsoil is impregnated with sea-salt to an extent which rendered underground cables practically impossible, so that overhead distribution is used exclusively, but here again special precautions are rendered necessary by the climatic conditions. Karachi is not only by the sea and subject to winds from over the water charged with salt spray, but is on the edge of a desert, from which sand storms are liable to come when the wind is in the opposite direction. Erosion as well as corrosion is therefore liable to take place. For these reasons special protective measures, referred to hereafter, are taken with the overhead work, and particular care is taken to provide means

for completely closing up the engine-room on the approach of a sand storm. A considerable amount of difficulty was experienced with floods and uncertain soil in preparing the foundations, but a substantial bed of armoured concrete was

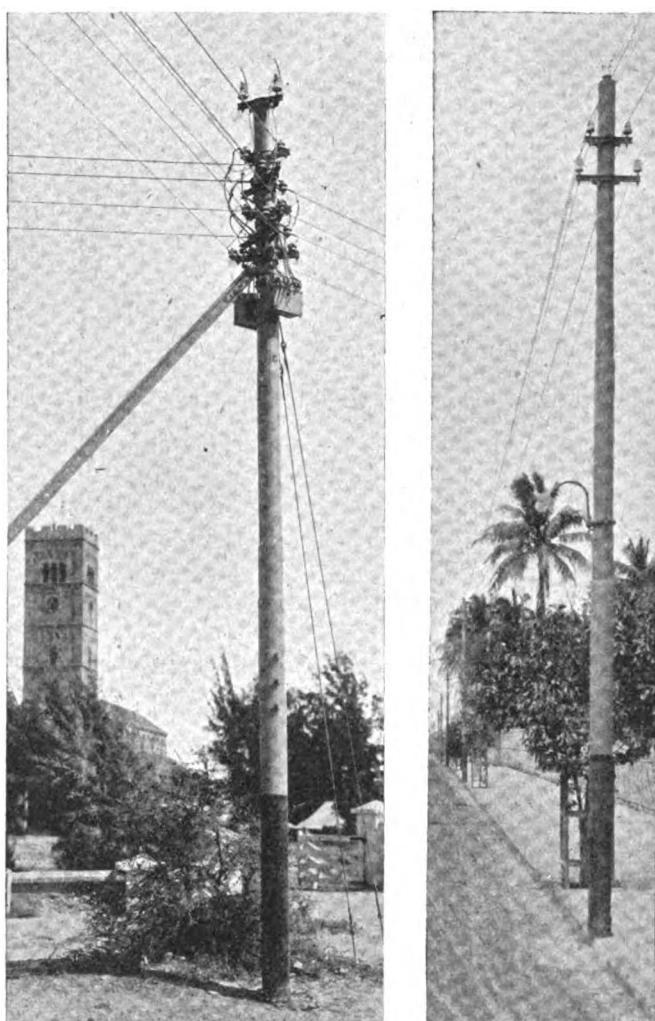

FIG. 2.—DETAILS OF OVERHEAD WORK.

eventually constructed to take the machinery. Some delay was also caused at the outbreak of the war by a portion of the staff being called off by Government work, and representatives both of the consulting engineers and contractors joining

FIG. 3.—TREATING BASES OF POLES.

the colours. The station, however, was ready for work in February of this year.

The main generating plant consists of two 240-b.h.p. and one 100-b.h.p. Diesel engines built by Mirrlees, Bickerton & Day, direct coupled to Crompton 440- and 580-volt dynamos.

The cooling water is dealt with by two coolers of Heenan & Froude's well-known rotary design, either of which alone can meet the full load conditions. These coolers are fixed in a separate cooler-house, and draw their air from the engine-room.

The main switchboard, consisting of three generator, two battery, two booster, two balancer, one summation, one earth, and three feeder panels of white marble, complete with moving-coil measuring instruments and switchgear, is mounted above the battery-room, being thus raised some 7 ft. above the engine-room floor. The battery consists of 276 Tudor cells, having a capacity of 653 ampere-hours at the 10-hours' rate. The voltage of supply is 220 on either side of a three-wire system, 440 volts across the outers, but at full load the station voltage will rise to about 512 volts, to compensate for the drop in the feeders. This necessitates battery regulating switches having a large number of contacts. These switches are of the horizontal pattern fixed in the floor above the battery-room behind the main switchboard, and are operated by levers similar to railway signal levers in front of the board. There are two automatic balancers, each capable of dealing with an out-of-balance current of 75 amperes, and three motor-driven boosters each capable of a continuous output of 150 amperes at 0-115 volts.

The whole of the overhead work has been carried out in strict accordance with the regulations of the Indian Government, and is most substantial throughout, with a considerable margin in the strength of the poles for additions as the undertaking develops. The weight of copper installed with the first section is 86 tons. In view of the climatic conditions already referred to, it has been considered advisable to protect the insulators by coating them with stoved bicycle enamel, and the whole of the copper, lines and all, is covered with special preservative paint. The steel poles are also covered with tarred hessian at the bases to protect against the corrosive action of the soil. Details of some of the overhead work are seen in the accompanying illustrations. The starting point of the outgoing feeders is seen in the view of the generating station in Fig. 1. In conclusion, we wish to express our thanks to Mr. H. W. Handcock, of the firm of Handcock & Dykes, consulting engineers to the scheme, for his courtesy in placing details and photographs relating to the undertaking at our disposal.

THE "LOCK-OUT" CONTACTOR SYSTEM OF MOTOR CONTROL

ATOMATIC motor control by contactor gear is coming into use very largely, not only for starting and stopping of motors driving pumps, compressors, &c., without an attendant, or where the scheme involves a number of complicated connections which must be rapidly made, as in the case of lifts and bridges, but also where the use of hand-operated apparatus for large motors becomes cumbersome and physically difficult in operation. Where it is necessary to have automatic acceleration, it is obtained by a solenoid controlled by a dash-pot, by counter E.M.F. control, or by current limit control. In this last, which has many advantages over the others, it has been usual to employ series relays, the dropping of which was governed by the motor current, which system results in the resistance being cut out just when the motor is ready for the change. The British Westinghouse Co. have recently put on the market a system known as "the series lock-out contactor system," which has all the advantages of these relays mentioned above, but in which is entirely eliminated the one weak point, the relay contacts. Its name is due to the special characteristic of the contactor used of "locking out" or not closing when the current is above a certain value. An automatic starter made up of a number of these contactors may have them so adjusted that they will only close with a pre-determined current on the motor. As long as the current is above the value at which the contactors have been adjusted to close, nothing will happen, a step of resistance being cut out only when the current has fallen down to the pre-determined value. The details of the contactor are seen in Figs. 1 and 2.

The motor current passes through the operating coil winding directly. With the contactor in the open position (shown in full lines), at the instant of applying current, assuming this

current to be above the value at which the contactor should close, a flux will pass through the main air-gap, through the armature, and along the steel piece A fixed to the armature and carrying the adjusting plug, then through the small air-gap between the adjusting plug, and on to the base. This flux tends to hold the contactor in the open position due to the pull between the adjusting plug and the base of frame being greater than the pull at the main air-gap. For a fraction of a second current is prevented from passing through the part marked "saturated section," due to the very heavy damping coil which is wound round this. The necessity for this will be explained later. As the current falls, due to the motor speeding up, the flux through A decreases, but the flux through the saturated section remains the same. In consequence, the pull between the adjusting plug and the base of the contactor decreases, until a point is reached where the pull through the main air-gap overcomes the pull at the adjusting plug, and the contactor closes. Adjustment of the air-gap between the plug and the base of the contactor alters the current value at which the contactor closes. Without the damping coil the contactor would close as the current was rising upon it, reaching the value at which it was set to operate. The damping coil sets up an entirely different condition in the magnetic circuit when the current rises very rapidly. Under these conditions the flux is prevented from passing through the portion marked "saturated section," and consequently it all passes through the adjusting plug. The increased "pull out" set up is so great that the contactor cannot close. In a fraction of a second after the current reaches the full value, the flux divides between the two circuits as previously described, and the contactor is held out by the normal operation of the lock-out device. It is free to close when the current falls to the value for which the contactor has been adjusted.

An ordinary non-reversing automatic starter embodying this type of contactor would contain, firstly, a shunt-wound contactor, the circuit of which would be made from some distant point, or from a switch operated by the rise and fall of water in the tank, or rise and fall of air-pressure in an air system, &c., as required. Secondly, a number of contactors of the type described above, which serve to short-circuit the resistance in the armature circuit. These contactors are so connected that without the use of any interlocking contacts each contactor is put into circuit, and consequently closes, in the order desired. Also the different contactors have their coils short-circuited, and consequently fall out as the next step of resistance to them is short-circuited, so that in the "full-on" position only the shunt-wound line contactor and the last series-wound contactor are in circuit. In order to keep the shunt coil as nearly as possible in line with the series coils as regards reliability, it is wound for a low voltage, and a resistance is connected permanently in series with it. The coils are impregnated with a special damp-proof compound

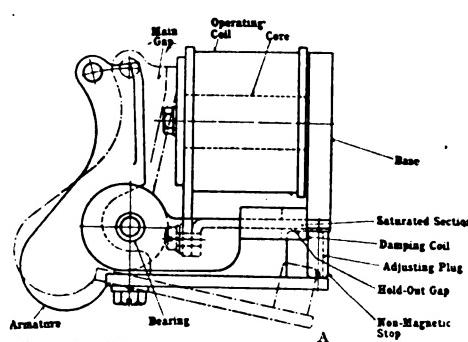

FIG. 1.—DETAILS OF LOCK-OUT CONTACTOR.

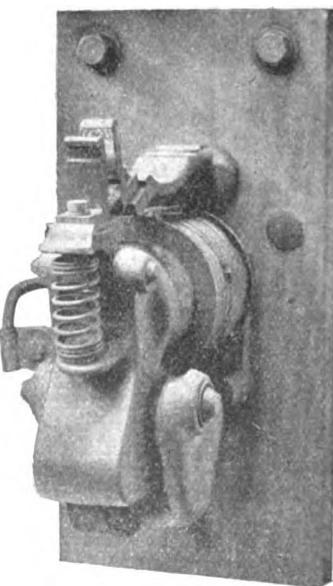

FIG. 2.—LOCK-OUT CONTACTOR.

which is capable of withstanding a high temperature without damage. The advantages over other automatic starter systems of simplicity in the reduction of the number of shunt coils

to a minimum and the absence of dash-pots and small interlock and other contacts will readily be appreciated. This apparatus was originally designed to meet the arduous conditions of rolling-mill work, where the adoption of automatic acceleration has very great advantages.

In addition, the elimination of the mechanical features connected with the earlier type of automatic gear, which has been possible by the adoption of the lock-out system, has quite fulfilled the requirements, and the extension of this type of apparatus to the ordinary applications of automatic starters and controllers will no doubt, due to the extreme simplicity and consequent reliability, overcome the distrust which exists in many quarters, and render its adoption more general.

THE LIGHTING OF RIFLE RANGES

A DISCUSSION on some points in connection with the lighting of rifle ranges was opened by Mr. A. P. Trotter at a meeting of the Illuminating Engineering Society on Tuesday of last week. Mr. Trotter described some of the difficulties which were experienced by those practising at rifle ranges, difficulties that were more strongly felt by elderly men with a liability to long sight, and were intensified when shooting by insufficient artificial light owing principally to enlargement of the pupil. Shooting at a daylight range was much easier, as the fore sight could be much more clearly seen. Opinions, however, differed as to whether the target solely should be illuminated. A target might be too brightly illuminated; in this case the disturbing effect was due to glare rather than apparent reduction of the diameter of the bull's-eye by irradiation. He did not think that dark backgrounds for small white targets were any great advantage. Sources of light should, of course, be screened from view, and with regard to lighting arrangements for facilitating observation of results, manipulation of targets, &c., it was desirable to aim at diffusion of light similar to that obtained out of doors. In conclusion, Mr. Trotter referred to some experiments which he had carried out in conjunction with Mr. H. Brazil on the rifle range of the Charing Cross, West End & City Electricity Supply Co. at Fenchurch Street. On this the marksmen fired through two screens 8 ft. by 5 ft., the first one of which was approximately 10 ft. away from the man. The apertures in these screens were of a size that an ordinary 6-in. target was just seen at the end of the range. These screens were each lighted by two 50-c.p. lamps, although Mr. Trotter thought that four would be better. He also thought that it would be better to have the walls of the range lighted as well as just the target and the screens. The general effect of the arrangement as it stands is a better definition of the top edge of the back sight.

Mr. A. Blok was of the opinion that in artificially lighting ranges the effect aimed at should be to direct light on to the target, and not to pay attention to the surround. Referring to the question of whether the target should have a black background or a light background, his opinion, from an examination of a large number of ranges, was that the most comfortable conditions were obtained when the targets were mounted on a brown background. With a surface brightness of about 10 ft. candles comfortable conditions were obtained if there were 5 ft. candles on the surround upon which the targets were mounted. A man's shooting could be very materially improved if he were provided with a target of less contrast than the usual black and white. It might be taken generally as bad to have exposed lights on the range, and a great deal could be effected by providing a good general illumination around the firing point. Similarly, he thought that keeping the firing point in absolute darkness was bad for the reason that it was extremely dangerous and uncomfortable. Furthermore, he believed that it conducted to optical fatigue. He had found from experiments with gradually increasing illumination from $2\frac{1}{2}$ ft. candles upward that an illumination of the target of about 12 ft. candles was the most comfortable for general work. At 50 ft. candles colour fringes made shooting difficult, and from 100 ft. candles upwards it was impossible to carry on the shooting notwithstanding that this illumination was very much less than was obtained with outdoor ranges and daylight.

Mr. Schamach thought that the only admissible form of illumination at the firing point was the completely indirect system.

Mr. H. Brazil said that he was interested in this matter as a secretary of a club owning three ranges and having 260 members. He first started with 50-c.p. lamps about 3 ft. from the targets on the floor inclined upwards. For some time they shot with these lights only. Difficulties, however, arose, partly due to the method of suspending the targets, the wires having a tendency to twist, so that eventually they tilted up and pointed at the light. To get a better illumination he put the lights above the target. That had a very good effect, as there was a good general illumination independently of whether the target was tilted or not. He agreed that the sources of light should be

screened from view, although it did not matter very much with the orthoptic sight if there was a good general illumination. As to Mr. Trotter's experiments at the Charing Cross range, the men could see the back-sight and fore-sight very much more clearly under these conditions than under the old conditions. He was inclined to think that the illumination from the firer to the target should be gradually diminished between the target and the firing point, and also, if possible, that the illumination on the bull should be three or four times that on the sights around it in order to get the bull more clearly defined.

Col. Gaitshill Burr said that his general experience of miniature ranges in London was that they were not sufficiently well lighted, and Mr. Freak suggested that a light background might have the same effect as the screens at the Charing Cross range. Speaking of lighting at the firing point, Mr. W. J. Bassett said that the difficulty was that if a light was behind it was not in the right place, whilst if it was in front, or on the right or left, it caught the eye. Semi-indirect lighting all round was an improvement. The closest imitation of daylight he had seen at a miniature range was at the Royal Automobile Club. The background was green, and there was a row of incandescent lamps at the bottom with an arc lamp at the top, and a combination of the two produced a very bright light, but it was a very difficult range to fire on.

In a written communication, Mr. Frank Bailey said that the lighting of an indoor range was an easy matter to carry out, and it did not seem necessary to limit the illumination provided it was well diffused and there were no harsh lines or brilliant beams of light. A target with a black bull on a white ground was easier to hit than a white bull on a black ground. In using the orthoptic sight most shots preferred to have the firing point dark, but with open-sight it is essential to have light on the firing point in order to be able to see the sights of the rifle. If the range is dark, with the exception of the target, he had found that sources of light should be screened from view in order to prevent distracting rays from crossing the line of sight, and in illuminating the target it was better to place the course of light below the target, thus throwing the light upwards. Mr. J. G. Clarke said that with a target illumination of less than 4 ft.-candles men complained of eye-strain and expressed a preference for illumination from 8 to 20 ft.-candles. Mr. G. Herbert, referring to the ranges on the Embankment, said that the illumination was from 8 to 15 ft.-candles, and very even illumination was obtained by steel reflectors. The targets were 2 ft. 6 in. apart and 2 ft. 6 in. from the ground, and the reflectors were 2 ft. 6 in. from the face of the target to the centre of the filament of the lamp. These reflectors were on a movable frame, so that they could be adjusted according to whether a bull or a figure target was being fired at, the degree of illumination in the two cases being different. Other targets were illuminated in the same way, except that the reflectors were reversed and hung from the ceiling. Light was given at an angle of 45 degrees.

GERMAN ELECTRIC LIGHT CABLES

Zinc Cables Insulated with Reclaimed Rubber

A NOTICE has been issued in Germany that the iron wires and cables insulated with indiarubber which have been put on the market in that country are contrary to the new emergency standards and are no longer to be employed. Paper insulation under a metal covering is allowed with iron wires, but rubber-insulated wires must be of zinc, and for the rubber only reclaimed rubber may be employed. The reason given is that, owing to the mechanical weakness of the reclaimed rubber, it would be liable to break in handling if it were employed on stiff iron conductors. New standards have been issued for the zinc conductors which are to be used as a substitute for copper. The sizes of the zinc cables range from 1.5 sq. mm. (equivalent to about 17 S.W.G. zinc wire or 22 S.W.G. copper) to 150 sq. mm. (equivalent to about 37/13 S.W.G. zinc or between 19/15 and 19/16 S.W.G. copper), and the radial thickness of this inferior rubber is to be 1 mm. (0.039 in.) on the smallest size, increasing to 2 mm. (0.079 in.) on the largest size—that is to say, in the case of the bigger cables even less than the standard of the British Engineering Standards Committee for good rubber. Apparently seven-strand wire is to be used even for the smallest size, and 19- and 37-strand for the larger sizes.

Westinghouse Staff and Munitions of War.—A short time ago a movement was started by the engineering and other office staff of the British Westinghouse Electric & Mfg. Co., Ltd., to express in a practical form their patriotic feelings, and it was suggested by them to the management of the Company that they should undertake in their spare time some manual work on munitions of war. This offer was accepted by the management, and operations were commenced almost immediately. For the present each man will work a 5½ hours' shift one night per week, commencing at either 6.30 in the evening or 12 o'clock at night. We understand that approximately 300 staff men have already volunteered for work on this basis.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,444.

State briefly and concisely what switchgear is necessary for a balancer panel for a 3-wire supply system, and explain its connections and the function of each piece of apparatus.

(Replies must be received not later than first post, Thursday, June 3rd.)

ANSWERS TO No. 1,442.

A 12-pole single-phase alternator, the rotor of which has open slots and is wound like an ordinary D.C. wave armature, has an extremely bad regulation on low power factors ($\cos \phi = 0.3$ to 0.5).

Ratio of Pole arc to Pole pitch = 0.63. Air gap = 0.05".

Can the regulation be improved without re-winding the rotor? If not, should slots in rotor between the poles be left empty, so as to diminish the rotor demagnetising effect? Would tunnel slots in the rotor improve the regulation? With 121 slots in rotor, should tappings be taken from slots 1 and 11 or 1 and 61?—"Y.E.L."

The first award (10s.) is made to "W. H." for the following reply :—

The causes of bad regulation in alternators are principally: ohmic drop (on small machines only), armature reaction, and inductance. The first-named is inherent and cannot be altered, as it would usually be impossible to wind the armature with larger wire. Dealing with armature reaction, this produces bad regulation by distorting the field, and consequently weakening it when on unity power factor, and actually demagnetises the field on lagging power factors until at zero power factor (lagging) the whole strength of the armature reaction tends to demagnetise the field. Inductance of the windings is again inherent, and cannot be altered without changing the winding. It will be seen that in order to improve the regulation of the alternator in question it will only be possible to do so by reducing the effect of armature reaction. The first and most obvious method is to lengthen the air-gap either by boring out the frame after removing the poles, or by grinding down the pole-faces. This will, of course, reduce the demagnetising effect of the armature, and thus improve the regulation. The extent to which this can be done will be limited by the heating of the field windings, or by the capacity of the exciter, as with a longer air-gap more ampere turns will be required per pole to produce the same flux. Fitting amortisseur rings on the poles might also produce a slight improvement. This is all that can be done to improve the regulation without re-winding the armature. If the alternator is a large one, it may pay to install a Tirrill or other voltage regulator. Coming now to improving the regulation of the alternator by re-winding the armature, it will certainly improve the regulation of the machine to wind only in the slots under the poles—that is, approximately two-thirds of the slots will be filled. At the same time, this will not materially alter the voltage, as the coils in the slots between the poles do not generate E.M.F., but do increase the inductance of the armature, thus

adversely affecting the regulation. Fitting a new rotor with tunnel slots would probably improve the regulation, as the iron on the top of the slots would provide a path for the flux produced by the armature demagnetising ampere turns instead of this taking the normal path along the air-gap. Tunnel slots would, however, very considerably increase the inductance of the armature, and this would tend to make the regulation worse. As to which effect would predominate depends entirely on the design of the alternator. With reference to the correct spacing of the taps, it would appear to be an alternator with an ordinary D.C. winding having a circuit close on itself. The taps would therefore require to be 180° electrical apart, and this would be obtained by tapping Slot No. 1 and Slot No. 11. If by any chance the winding is required to be of the open type, the taps would be taken from adjacent slots.

The second award (5s.) is made to "E. H." who writes as follows :—

Before considering the methods by which the regulation of a single-phase alternator can be improved, it is necessary to understand what factors govern the variation of the terminal voltage with load. The fall in voltage consequent upon increase of load is due to three causes :—(1) The resistance of the armature winding; (2) the inductance of the winding; (3) the phase difference between the current and the voltage. The resistance can be diminished only by decreasing the number of turns and increasing the sectional area of the conductors. Both of these are inapplicable to the present case, since the first would give a smaller voltage, and the second would require larger slots. Further, the resistance drop is generally only a very small proportion of the total drop in volts. The inductance of the winding depends chiefly upon the number of turns, the flux density in the teeth, the size and shape of the slots, and the length of the air-gap. Since it is not intended to put in a new rotor, the first two factors have to remain unaltered. Had semi-enclosed slots been used, the inductance of the windings would have been greater; and would have been still greater with tunnel slots. A longer air-gap decreases the inductance, and so improves the regulation. When the rotor is hand-wound, i.e., wound by pulling the wires through the slots, it is customary to leave about a third of the slots empty, and thus decrease both the resistance and the inductance of the winding. With an ordinary D.C. wave winding, however, all the slots have to be filled. The greater the angle of lag of the armature current behind the voltage, the greater is the demagnetising effect of that current, and consequently the smaller is the E.M.F. induced. Now in a single-phase alternator the M.M.F. of the armature current is a pulsating one, and can therefore be resolved into two equal components of half the amplitude rotating in opposite directions at synchronous speed. The component rotating in the same direction as the poles is consequently stationary relative to the latter; whereas the second component has a relative speed of twice the synchronous value. The second component thus endeavours to produce a periodic variation in the main flux. This effect is damped down by the eddy currents induced in the solid parts of the magnetic circuit, and still more effectively by those induced in the "damper winding." Hence, as far as the field magnets are concerned, we are left with the one component, the amplitude of which is only half that of the pulsating M.M.F. Coming now more directly to the question, we find that the regulation can be improved by (1) increasing the air-gap, and (2) by fitting the pole-shoes with a damper winding. The extent by which the gap can be lengthened depends upon the possibility of obtaining sufficient voltage for excitation. If the temperature rise is then excessive, either a fan can be fitted to the rotor, or more turns can be added on the field, if space permits. The second is the more effective method, and apparently has not been tried on this particular machine. The amortisseurs may take the form either of the usual bars through the pole-shoes, or of thick copper sheets attached to the face of the pole. The latter would be the simpler, if the air-gap can be increased a little. As regard the tappings, these must be such that the number of conductors is divided equally—or nearly so—between the two parallel paths. If the tappings were taken from slots 1 and 61, and if there were two conductors per slot, there would be only six conductors forming one of the circuits, whilst the other would have 236 conductors. With such an arrangement, the terminal voltage would be very small. If the tappings are from slots 1 and 11, there are 120 and 122 conductors respectively in the two circuits. An equal division of the conductors in this case would require the tappings to be taken from opposite sides of the armature—an arrangement that would generally be inconvenient.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 20th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

2,323/14. **Arc Lamp.** E. A. GIMINGHAM. An arc lamp with tungsten or similar electrodes, enclosed in a bulb similar to that of an incandescent lamp containing nitrogen or other inert gas. The electrodes are horizontal and of small diameter, and the arc is struck by a simple thermo-mechanical device. (Three figures.)

8,842/14. **Cables.** W. F. PRICE and CALLENDER'S CABLE & CONSTRUCTION CO., LTD. An excessive pressure is apt to be developed in cables with oil or other liquefiable insulation by bends in laying, and a pressure relieving joint is described in this specification. The joint-boxes have an intermediate partition with air-tight and insulating means of carrying the conductors through it. Each portion of the box is provided with means for exhausting air and introducing oil and a pressure-relieving air-chamber. (Two figures.)

10,531/14. **Traction.** B.T.-H. CO. (G.E. CO., U.S.A.) A system of traction motor control in which current from a single-phase line is supplied to polyphase motors through a special phase converter. (Five figures.)

10,775/14. **Telegraphy.** S. LYLE. A method of sending messages by persons unacquainted with the Morse code more rapidly than is possible by hand-sending, by means of a board with rows of suitably spaced contacts representing each letter, over which a contact pencil is rapidly drawn by hand. (Nine figures.)

10,822/14. **Protective Gear.** A. G. COLLIS and CROMPTON & CO., LTD. A protective system for A.C. circuits, in which superimposed currents actuate suitable timed relays at various points. These relays are rendered operative on the development of a fault by currents set up in the secondaries of transformers, and cause the tripping of switches isolating the faulty section. (One figure.)

11,107/14. **Synthetic Hydrocyanic Acid.** A. V. LIPINSKI. A method for the synthetic preparation of hydrocyanic acid by the circulating passage of a gas mixture consisting of hydrocarbons, hydrogen, and nitrogen through an expanded high-pressure arc. The reactive gas mixture is cooled and freed from hydrocyanic acid, and blown in directly behind the point of most intense heat of the reaction for the purpose of preventing the decomposition of the part of the mixture which has not undergone the reaction. (One figure.)

14,861/14. **Commutators.** A. H. MIDGELEY and C. A. VANDERVELL. A commutator in which the sides of the segments and of the insulating sheets are provided with overlapping notches which are filled with a plastic insulating compound which afterwards becomes hard. (Three figures.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

DYNAMOS, MOTORS AND TRANSFORMERS: CROMPTON & CO. and PENSABENE [Dynamos] 11,399/14; YERGER [Motor control] 21,271/14.

IGNITION: MASON [Magneton] 22,149/14.

Storage Batteries: OLDHAM [Secondary batteries] 16,509/14; BLUEMEL and BLUEMEL BROS., LTD. [Battery boxes] 19,197/14.

SWITCHGEAR, FUSES AND FITTINGS: BENJAMIN [Lamp holders] 7,298/14; RAILING and GARRARD [Fuses] 14,159/14; DAY [Lamp holders] 16,363/14; BEUTTELL and A. W. BEUTTELL, LTD. [Illuminating devices] 17,033/14; LAMKIN [Switches] 17,396/14; EVERED & CO. and NICHOLAS [Self-supporting brackets] 20,476/14; LAWSON [Combined lamp and reflector] 23,555/14; MIDGELEY & VANDERVELL [Dash-board lamps] 2,242/15.

TELEPHONY AND TELEGRAPHY: JUDD, FRASER, WOOD, and EASTERN TELEGRAPH CO. [Telegraphy] 5,294/14.

MISCELLANEOUS: SOC. ANON. DES AUTOMOBILES & CYCLES PEUGEOT [Transport of searchlights] 11,083/14; TORCHIO [Reactance coils] 11,116/14; HULBERT [Bicycle flash lamp] 12,189/14; GOODFELLOW and NEW BRITISH EVER READY CO. [Portable battery lamps] 3,521/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

CABLES, INSULATING MATERIALS, &c.: SOC. CERAMICA, RICHARD GINONI [Insulators] 24,631/14.

TRACTION: GES. FÜR ELEKTRISCHE ZUGBELEUCHTUNG [Train lighting plant] 13,554/14.

MISCELLANEOUS: COMPAGNIE DE FIVES LILLE [Magnetic clutches, &c.] 3,910/15; COLLER [Generating set] 6,098/15; SIEMENS & HALSKA A.-G. [Fire alarms] 6,457/15.

The following Amended Specification can now be obtained:

TRACTION: BROLT, LTD. [Car lighting] 27,604/12.

Expiring and Expired Patents

The following Patents expire during the current week, after a life of fourteen years:-

10,974, 10,975, and 10,976/01. P. M. JUSTICE (Castner Electrolytic Alkali Co., U.S.A.) The first two of these deal with details of construction of electrodes for electrolytic cells for the manufacture of alkalis by the Castner process, and the last is for a method of supporting oscillating cells used in this process.

11,242/01. **Electric Primers.** SIR W. G. ARMSTRONG, WHITWORTH & CO., LTD., and J. G. STUART. Insulation of conductors in an electric primer for gun-firing, constructed to prevent escape of gas.

The following are the more important Patents that have become void through non-payment of renewal fees.

DYNAMOS, MOTORS AND TRANSFORMERS: W. J. STILL [Homopolar generators] 2,411/08; E. TURNER [Homopolar generators] 2,959/09.

Electrochemistry and Electrometallurgy: P. GURUTI and R. POMPILI [Electrolytic apparatus for making oxygen and hydrogen] 2,820/02.

Incandescent Lamps: C. SCHWABE [Tubular lamps and fittings for footlights] 2,829/04.

TELEPHONY AND TELEGRAPHY: W. E. HEYS [Microphones] 2,713/03; J. D. WHITE [Printing telegraphs] 3,067/07.

MISCELLANEOUS: P. C. HEWITT [Mercury vapour rectifiers] 1,851/04; W. H. CHAPMAN [Neutralising static charges on paper and fabrics] 2,474/05; W. SCHRÖDER [Electric time alarms] 13,523/09.

CATALOGUES, PAMPHLETS, &c., RECEIVED

LAMPS.—A new leaflet from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), gives prices of the full range of "Atmos" (gas filled) drawn-wire Osram lamps made at the Hammersmith works. These include sizes consuming 100 to 500 watts for 50 to 60 volts, 150 to 1,500 watts for 100 to 130 volts, and 300 to 1,500 watts for 200 to 225 volts, and the consumption is approximately half a watt per candle-power.

ELECTRIC COOKING.—A useful cooking set called "El-Grilstovo," consisting of a 600-watt circular open type glowing heater, 7½ in. diameter, a pan and a grill deflector, and retailing at one guinea complete, is described in a leaflet from Drake & Gorham, Ltd. (1 Felix Street, Westminster Bridge Road, S.E.).

SIGNS.—A new form of illuminated sign with interchangeable lettering is described in a leaflet from the Sun Electrical Co., Ltd. (118 to 120 Charing Cross Road, W.C.). A number of different patterns of this sign are manufactured, and are supplied complete with outfits of from 100 to 300 letters, figures, spaces, &c. Some of the models are combined with a reflector, lighting the goods displayed at the same time as the announcement is made.

REFLECTORS FOR HALF-WATT LAMPS.—Another list from the Sun Electrical Co. gives particulars of a new range of "Sunlite" enamelled steel reflectors for half-watt lamps, comprising extensive, extra-extensive, intensive, and angle parabolic types for interior illumination. These reflectors, although only recently introduced, are already in use in a large number of engineering workshops, factories, and stores.

DUST BELLOWS.—A card from the General Electric Co., Ltd. (67 Queen Victoria Street, E.C.), gives particulars of a British-made model of wooden dust "belows" for blowing dust out of electrical machinery and other places, and on the other side calls attention to the Company's well-known "Freezor" fans. The card can be over-printed with contractors' names and addresses, and is suitable for sending out with correspondence.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.]

Australia.—The Victorian Railway Commissioners require a supply of voltmeters, ammeters, and wattmeters. July 14th.—The Deputy Postmaster-General, Hobart (Tasmania), requires 8 miles of paper-insulated lead-covered cable for telegraph and telephone purposes. June 21st.—The Sydney Corporation requires a supply of maximum-demand indicators. July 19th. Further particulars in each case at 78 Basinghall Street, E.C.

Burton.—A three-phase main is to be laid at an estimated cost of £70 to supply the new Belgian Engineering Co. which has started business in Burton.

Edinburgh.—The Electricity Committee requires two 5,000-kw. turbo-alternators and condensing plant. City Electrical Engineer. June 21st.

Manchester.—A L.G.B. inquiry was held last week concerning the borrowing of £543,000 for the equipment of the new power station at Barton. This matter has been the subject of correspondence between the Corporation and the Treasury, the general feeling in Manchester being that the new Barton station should not come within the category of schemes not required for war purposes. The demands upon the Manchester Electricity Department by firms engaged on Government contracts are very considerable. It is, therefore, satisfactory to know that the L.G.B. Inspector at the inquiry stated that he had been instructed to deal with the application at the earliest possible moment. Mr. S. L. Pearce, City Electrical Engineer, stated he would have to refuse any further supply unless he can proceed with the new power-house.

Walsall.—L.T. distributing mains are to be drawn into existing conduits at an estimated cost of £450.—The L.G.B. has sanctioned the borrowing of £16,700 out of £23,595 recently applied for.

Miscellaneous

Edmonton.—Tenders are invited for the maintenance of the inter-communication fire alarms at the various elementary schools. Education Architect, Town Hall.

South Wales.—The Penrhybwr Navigation Colliery Co. invites tenders for 3, 6, or 12 months' supplies of electrical fittings.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. Geo. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £86 10s. to £87 10s. (last week, £87 10s. to £88 10s.).

Change of Style.—The business of H. Weidmann (Rapperswil, Switzerland), manufacturer of insulating materials, has been formed into a company entitled "Fabrique de Cartons Presspan et de Matières Isolantes pour l'Électricité."

Advance in Prices.—A. P. Lundberg & Sons (477 to 489 Liverpool Road, N.) announce that on all orders received after Monday last the net amounts shown on invoices will be subject to an increase of 15 per cent. instead of 5 per cent. as hitherto.

Agency.—A firm of agents in Cape Town, a partner of which will shortly be in London, desires to secure the representation of United Kingdom manufacturers of high-class electrical fittings. Further particulars at 78 Basinghall Street, E.C.

W. T. Glover & Co.—In the Chancery Division last week, Mr. Justice Astbury granted an application to alter the Articles of Association to enable the Company to acquire and work lead, copper, and coal mines, and to make lead, copper, and other alloys. It was explained that this extension is for the purpose of the existing business. The Company intended, it was stated, to acquire coal mines for its

own purposes, either by itself or in combination with other companies, or to acquire shares in such companies.

Change of Address.—Messrs. Tyler & Freeman are removing from 20 New Bridge Street, E.C., to larger premises at 40 Chancery Lane, W.C. Telephone number, Holborn 6490; telegraphic address, Potential Holb. London.

The Dalston Publicity Department of Siemens Bros. Dynamo Works, Ltd., is being transferred as from to-day (Thursday) to 39 Upper Thames Street, E.C.

APPOINTMENTS AND PERSONAL NOTES

Professor Sir J. J. Thomson, F.R.S., has been awarded the Albert Medal of the Royal Society of Arts for his researches in physics and chemistry.

Mr. Arthur Wright recently arrived in Boston to take up an appointment in an advisory capacity to the Edison Electric Illuminating Co.

Mr. J. F. Cameron, Borough Electrical Engineer at Northampton, has been appointed manager of the tramway system in that town. Mr. Cameron has been acting as manager *pro tem.* since the resignation of Mr. Gottschalk.

Mr. H. M. Taylor, Borough Electrical Engineer at Middlesbrough, has obtained a commission in the Royal Marines (Submarine Dept.). At the last meeting of the Electricity Committee Mr. Taylor stated that he proposed to retain the management of the works by "remote control."

LOCAL NOTES

Glasgow: *Municipal Showroom.*—The conditions for the exhibition and sale of electrical appliances at the Electricity Department showroom agreed with the electrical contractors have now been issued. They are in accordance with those given on p. 128 of our issue for March 28th.

Grays: *Loan Refused.*—The L.G.B. has refused to sanction a loan of £600, as it is intended for mains extensions for ordinary consumers.

London: Islington: Infirmary Lighting.—The lighting of the Highgate Infirmary, which has, from time to time, been the cause of much controversy, is again under consideration. The Guardians are at present undecided as to whether they shall continue to generate electricity for themselves or accept an offer from the Borough Council for a supply in bulk. The cost of putting the existing battery and plant into order is estimated at £700, whilst the necessary alterations to link up with the Council's mains is put at £500. The present cost of generation is 1½d. per unit, and the Islington Borough Council quotes an all-round price for power and lighting at 2d. per unit. The Chairman and Vice-Chairman of the Electric Lighting Committee are in favour of continuing the existing plant, but the matter has been referred to the Lighting Committee for further consideration. In consequence, the Chairman and Vice-Chairman have resigned from the Committee.

South Shields: *Plant Extensions.*—The scheme of extensions at the electricity works just completed has cost £39,000. These extensions include a 1,500-kw. 2,000-volt three-phase 50-period turbo-alternator running at 3,000 r.p.m. The boiler plant extensions include a new boiler-house, in which has been installed two B. & W. water-tube boilers each having a heat surface of 5,346 sq. ft., coal bunkers, and conveying plant.

Walsall: *Bulk Supply Agreements.*—The Borough Electrical Engineer has been instructed to insert in all future agreements for current in bulk a coal clause, by which the price per unit will rise or fall according to the price of coal.

SUMMARY

A NUMBER of matters were discussed at the annual general meeting of the Institution of Electrical Engineers last week. Emphasis was laid upon the need for strengthening the financial position of the Benevolent Fund, which was referred to as quite unworthy of the Institution. An effort is being made to secure a modification of the Treasury bars upon capital expenditure on public works. The number of members who have joined the Forces now amounts to 928. A suggestion was made that these members might be relieved of the necessity of paying their subscriptions during the war (p. 232).

A FACSIMILE of the badge issued to members of the Electrical Emergency Service on taking up their duties is given on p. 233.

WE regret to record that 2nd Lt. H. G. Byng, third son of the late Mr. Gustav Byng, has been killed in action (p. 233).

A PAPER on colliery lighting installations was read recently before a joint meeting of the National Association of Colliery Managers and the Association of Mining Electrical Engineers by Mr. C. S. Corlett (p. 234).

ELECTRIC power is used in connection with the recovery of alluvial tin in South Africa (p. 234).

SEVERAL patent specifications relating to Electricity in Mines have been published during the last month. Two deal with safety lamps, one with flame-tight motor protection, and another describes a relay for bell signalling in mines (p. 235).

A QUESTION relating to the reversal of single-phase motors is propounded in our Questions and Answers column (p. 236).

THE British staff of the Constantinople Telephone Co. has returned safe to England.—Other notes under Telephony and Telegraphy deal with the construction of loading coils and wireless call devices (p. 236).

AMONG the subjects of Specifications published at the Patent Office last Thursday were lampholders, travelling searchlights, constant voltage generators and fuses. Application has been made for the restoration of a lapsed patent relating to mounting of metal filaments (p. 237).

RECENT innovations in train control used in New York are referred to in our Electric Traction Notes (p. 237).

ARTICLES in our Trade Section deal with motor-car accessories, an electrical tide gauge, railway carriage lighting, and alternator field regulators (pp. 238-9).

TRANSFORMERS and mains (£4,000) are required at Stalybridge; a three-phase H.T. switchboard at Redditch, and generating plant at Northampton.—A loan of £25,000 has been sanctioned at Derby (p. 239).

THE financial control of the Glasgow Electricity Department is to be placed in the hands of the Engineer and Manager.—Meter-reading errors involving a sum of £1,000, have occurred at Stoke-on-Trent.—London municipal electrical undertakings are recommended not to increase prices except where imperative.—Satisfactory results are recorded for last year by the Electricity Departments at Bury, Hull, and Dundee (p. 240).

ISSUES of new capital are being made by the Cornwall Electric Power Co. and the South Metropolitan Electric Light & Power Co. (p. 240).

THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION

THE programme of the Business Meetings which are to be held in London on June 17th and 18th, in place of the usual Convention, has now been issued. These meetings will not be open to visitors, and the customary social functions will not be held.

On Thursday, June 17th, reports by Mr. A. S. Blackman (Sunderland) and T. Roles (Bradford), on behalf of the "Point Five" Association, will be read on "The Practical Result of the Point Five Tariff" in the morning, and a report by Mr. F. Ayton (Ipswich) on "The Use of Electric Vehicles in Municipal Service" in the afternoon, when there will be a parade and demonstration of electric vehicles.

Friday, June 18th, will be devoted to the annual general meeting for business purposes.

These meetings will be held at the Institution of Electrical Engineers, Victoria Embankment, W.C. The Council has decided that engineer members of the Association on active service may be represented by deputies.

Association of Mining Electrical Engineers.—A meeting of the Notts and Derbyshire branch will be held at University College, Nottingham, on Saturday, June 5th, at 3.30 p.m. The Paper on "Experiences with Electrical Plant," by A. Smellie, will be discussed.

THE ANNUAL MEETING OF THE INSTITUTION OF ELECTRICAL ENGINEERS

THE Annual Meeting of the Institution of Electrical Engineers was held on Thursday, May 27th, Sir John Snell, the President, in the chair. An abstract of the Council's Report was given on page 213 of our issue of May 20th.

THE PRESIDENT, in referring to the result of the nomination for officers and Council, said there seemed to be a tendency for the representation to gravitate towards the lighting and power section of the industry, rather than to the telegraphic and telephonic section. Although the Council was responsible for the nomination of members of Council, the general body of members had considerable powers under the new Articles of Association to make any nominations they pleased and to add to the Council's list of nominees. It was, of course, too late to make any alteration this year, but he hoped that another year there would be more nominations from members. The fact that only 551 ballot papers were returned out of a total of over 4,000 which were sent out, showed rather a lack of interest.

In presenting the annual report of the Council, the President commented upon a number of matters. The Institution, he said, was to be congratulated that in spite of the serious times through which the country was passing, it had been possible to keep the meetings fairly well alive. There had been a most admirable set of Papers, and thanks were due to the authors.

A great deal of work had been done by the Institution in connection with national service. Not only had the Institution placed offices at the service of the War Office, but Mr. W. Duddell, Mr. A. P. Trotter, General Ruck, Mr. Robert Hammond, and others were instrumental in recruiting the Engineer Unit of the Royal Naval Division. Such a good type of man was obtained that the War Office called upon him (Sir John Snell) to make selections for commissions in the Royal Garrison Artillery, and in a few instances in the Royal Engineers, and he was happy to say that, although this had involved a good deal of work in weeding out, not one of the recommendations of the Institution had been turned down. He was also glad to say that in a few instances the candidates had already received captain's rank or full lieutenancies. The number of members now engaged in naval or military service was 928, and seeing that the total number of the Institution was about 7,000, and also remembering how many members were engaged on other national work, this was a very fair percentage and spoke a great deal for the loyalty of the members of the Institution. An effort was now being made to raise a Volunteer Engineer Corps under Colonel Clay. (Full particulars of this were given on page 224 of our last issue.)

Referring to the paragraph in the report as to the enemy's trade, the President said he wished to emphasise that the Committee had come to the conclusion, *with the concurrence of the manufacturers' representatives*, that the Institution could not take any useful action in the matter. The Council, he said, had been criticised adversely during the last year or two for its so-called inability to appreciate any industrial necessities. In this case joint meetings were held between the representatives of the B.E.A.M.A. and the Institution, and, although many suggestions were made, it was the joint opinion that nothing could be done in the matter at present, and that the matters which had been under consideration would solve themselves to a large extent by the result of certain economic principles.

The Loans Committee had been at work under the chairmanship of Mr. Hammond, and the Council that day had passed a draft memorial to the Local Government Board, which might be followed by a deputation, and it was hoped that certain concessions would be given which would be helpful to municipal undertakings.

In this connection he also mentioned that, as President, he was associated with the Presidents of the Institutions of Civil and Mechanical Engineers in making representations to the Treasury and the L.G.B. on the regulations restricting capital expenditure on public works, and it was possible some good might be done in that respect.

Coming to the Benevolent Fund, Sir John Snell referred to his recent appeal to the members, and said that, whilst the Council desired to acknowledge its indebtedness to the generosity of the donors and subscribers who had supported the Fund, it was felt that the response was totally inadequate. The result of the appeal was thirty-five annual subscriptions amounting to £41, and thirty-eight donations amounting to £276. Criticism had been levelled against the Fund that the outgoings were so small that there was no real necessity to extend the income; but that, he could assure the members, was quite wrong. At the time of his circular there were three, but now there were two, very important cases in which, if anything like adequate support was to be given, a very substantial annual contribution must be made; but this could not be done with the Fund at present at their disposal, without, at any rate, endangering the chances of helping others who might come later. We did not, continued Sir John, know what was in front of us. There were 928 members serving in the Forces; a great number would never come back, and some of them would have dependents who would look to the Benevolent Fund of the Institution to help them,

and what could they say, as one of the greatest engineering institutions in the world, it, when appeals were made, as he was afraid they were bound to be made, they were not able to help properly the dependents of those who had laid down their lives in the service of the country. He hoped at the beginning of the new session, when either himself or his successor would address the members on this same subject, there would be a more generous response. It was not a question of two or three guineas at a time. A great many of them could not afford that, but they could all afford to give their mite, and even a few shillings per head from the members of the Institution would give such an assured income that they could do proper and useful benevolence amongst those members who had fallen by the way.

Discussion of the report was then invited, and several subjects were touched upon.

MR. LL. B. ATKINSON asked if there was any reason why there should not be published a full list of the members of the various Committees of the Institution, in order that the general body of the members might know who were doing so much good work behind the scenes. With regard to the constitution of the Council, there was a feeling in many quarters, in a general way, that, as the Council itself proposed the list of candidates for new membership, if any outsider suggested members it would be considered as something in the nature of a criticism of the Council. He hoped the remarks of the President would go a long way to remove that feeling. Finally, with regard to the Benevolent Fund, whilst admitting that he had been a great sinner in not having yet contributed, he could not help feeling that the matter had not really been brought before the members in the way it should. The present was, of course, a very difficult time for people to make subscriptions to such funds, owing to reduced incomes and the general uncertainty as to the future, but he believed that if the matter was dealt with in a proper way and not by sending out appeals, as was done on the last occasion, with a lot of other papers which did not get read, more satisfactory results would be obtained. He agreed with the President that the present state of the Benevolent Fund was quite unworthy of the institution.

PROF. J. T. MORRIS asked for further information as to the reduction in membership.

MR. S. EVERSHED agreed that there had been a feeling among the members that to put up competitive candidates with the nominees of the Council was generally regarded as a form of criticism of the Council. As one means of getting over this he suggested that, as old members of the Council knew best the qualities necessary for making a good member of Council, these should be invited each year by the Council to suggest names of suitable men. In this way a new flow of names would be available without in any way trenching upon the duty of the Council in putting forward its list.

MR. W. M. MORDEY also supported Sir John Snell's appeal with regard to the Benevolent Fund. It was a very sad state of things that, after all these years of work, there was only the accumulated sum of £4,642. During the past year the contributions, taken as an average per member, was less than 6d. An increase in the Fund was urgently wanted for the necessities of deserving people, and what was wanted more than anything else were small contributions, anything from a few shillings to ten shillings from all classes of members, including the students. Many members probably did not want to contribute unless they contributed gold, but the management would be only too pleased with an average of 2s. 6d. a year per member. This would put the Fund in the position it should be. Many cases, quite pitiable, came before the management, which could not be put before the members of the Institution, and it was regrettable that in present circumstances these cases could not be helped.

MR. W. R. RAWLINGS suggested that an appeal asking all members to promise an amount not exceeding 5s. would result in 90 per cent. of the membership responding.

MR. F. C. RAPHAEL heartily agreed with the previous comments concerning the Benevolent Fund, but urged that gold contributions should be also encouraged as much as possible in a different manner. He suggested the formation of a fairly large committee of influential men, who could write personal letters to their friends and generally make a personal effort in collecting contributions, instead of sending out printed forms. Some of the richer firms also might be approached through their chiefs, who were members of the Institution, to give much larger sums than the majority of donations and subscriptions amounted to. Referring to the large number of members who had responded to the calls of the Army, he suggested that the Council might possibly find a means of remitting the subscriptions of these members during the war. This had been done in almost every club in the United Kingdom, and, if it was within the power of the Institution to do it, he was sure it would be appreciated.

MR. W. HOME MORTON suggested that the difficulty with regard to subscriptions to the Benevolent Fund might be got over by the members agreeing to a small addition to their annual subscriptions.

THE PRESIDENT, in replying, said he personally would thoroughly welcome the publication of a list of committees and

the attendances, as suggested by Mr. Atkinson. This was done in connection with the Incorporated Municipal Electrical Association, and nothing in the government of that Association pleased the members better. He believed it would astonish the members of the Institution to know the excellent attendances which were made by the members of the Institution Committees, and the matter would be considered by the Council. Similarly, the suggestions made regarding the composition of the Council would be duly considered. Probably he had not been quite fair to himself in his previous remarks on the question, because there was a very wide representation, having regard to the fact that the chairmen of the Local Sections were members of the Council, and also that the immediate past-chairmen were *ex officio* members. Thus there was a very good geographical distribution; but what he was aiming at was a more catholic representation, so that the various sections within the industry were fully represented. As to reduction in membership this was partly due to the examinations, which, however, whilst keeping down the number of new entries into the Institution, resulted in a much better class of man joining. That was all to the good. Probably also a number had resigned owing to present times, and due regard would be given to the suggestion of Mr. Raphael that some consideration should be given to those who had joined the Forces. He was afraid, however, it would be a big question to remit the subscriptions to the whole 900 members who were concerned, as it would mean a very big slice out of the total income. The various suggestions with regard to the Benevolent Fund were most valuable and would be considered by the Council.

MR. ROBERT HAMMOND then presented the annual accounts, which showed an excess of income over expenditure of £1,623 10s. 8d., compared with £2,832 12s. 3d. in the preceding twelve months. It was not, however, he said, the right thing to compare these two figures, as in the immediate previous years the Institution had benefited by the increased income due to the rush of members to join before the higher subscriptions came into force.

A short discussion then followed, chiefly with regard to certain technical details of the manner in which the accounts were presented, and the accounts were then passed.

Votes of thanks to the Honorary Secretaries of the Local Sections, to the Honorary Treasurer, the Honorary Auditors, and the Honorary Solicitors were passed, the Honorary Auditors were re-elected, and the meeting then adjourned.

THE ELECTRICAL EMERGENCY SERVICE

WE want *every* electrical engineer in London who will give at least either four hours a day of his spare time, or four hours on alternate nights, to become enrolled in the Electrical Emergency Service.

This Service is filling the gaps caused by switchboard attendants in London electricity works and substations who are leaving, or have left, to join the Army and to make munitions of war. A badge, of which the annexed sketch is a facsimile, is issued to members of the Service on taking up their duties.

We have many names on our register already, but not enough to meet the emergency demand which is certain to occur during the next few weeks in view of Lord Kitchener's appeal for 300,000 more men.

Moreover, it is the *good* men we most want: for instance, men over military age who have filled or are filling good positions in the electrical profession, who have arrived at the stage when they might normally take things a little easier after the strenuous life which this profession always imposes on its devotees, but who are willing now to defer their rest a little longer in view of the national emergency.

Applications for enrolment, on the form on p. vii., should be sent to the Editor of ELECTRICAL ENGINEERING, 203 Temple Chambers, London, E.C., who will be pleased to reply to any inquiries for further information, and from whom also further application forms may be obtained.

Engineering Institutions' Volunteer Training Corps.—Good progress has been made with the formation of this corps. Arrangements have now been made for drills three nights a week (Monday, Wednesday, and Friday) from 6.30 to 8.30 at the headquarters of the London Electrical Engineers Territorials, Regency Street, Westminster. The first drill was last night. Particulars with regard to the corps will be found in our last issue (p. 224), and readers wishing to join should communicate with Lieut.-Col. C. B. Clay, Marconi House, Strand, W.C.

OBITUARY

SECOND-LIEUT. HARRY BYNG, third son of the late Gustav Byng (founder and late Chairman of the General Electric Co., Ltd.), was killed in action on May 16th. His loss will be greatly regretted by

many friends, and the country has lost an able electrical engineer of the younger generation. We proffer our deepest sympathy to his two brothers and his colleagues.

HARRY GUSTAV BYNG was born on July 12th, 1889. He was educated at Harrow, where he was Captain of the School Gymnasium eight, and Monitor and Head of his House, for which he played both cricket and football; he also played for the Harrow Association Football XI. After leaving Harrow he joined Faraday House, and was

awarded the Silver Medal in his year. He then completed his education at Harvard University, where he passed all his examinations with honours, and enjoyed extraordinary popularity, both socially and as a good sportsman. He was Captain of the Harvard Association Football XI. When leaving Harvard he joined an exploring expedition into the lesser-known parts of Canada, and, after a short return home, joined the General Electric Co., Schenectady, as a pupil. He distinguished himself in the test room, and was on the fair road to success, when his duty towards his family called him back in order to assume a position in the General Electric Co., Ltd. He settled in Warwickshire so as to live near the works at Witton, and was on the point of assuming a position of responsibility when war broke out. His sense of duty to his country made him join his Majesty's forces during the first week. He trained with the Artists Rifles and went to France with them at the end of September, returning home on March 21st on five days' leave, during which time he married Miss Evelyn Curtis, of Boston and Beverly Farms, Mass., U.S.A. Immediately after he was gazetted 2nd Lieutenant of the Second Border Regiment, and fell in battle on May 16th near Festubert, in France, whilst leading his platoon. His commanding officer wrote: "Mr. Byng was wounded whilst most gallantly leading his platoon in action on May 16th. He was universally popular in the regiment. He had done very good work reconnoitring the enemy's trenches, and his loss is very great to the battalion." A letter from the adjutant of his regiment also pays tribute to Mr. Byng's courage and self-denial. It says: "He was shot whilst leading his men, and fell actually on the enemy's trenches. He lay quite uncomplainingly and would not allow any of his men to carry him back because of the danger to their lives."

Institution of Railway Signal Engineers.—The next meeting will be held at the Institution of Electrical Engineers, Victoria Embankment, E.C., when Mr. Bound will reply to the discussion on his paper, "A Review of the Art of Signalling and some Suggestions."

Institution of Electrical Engineers.—The following is the result of the ballot for new members, &c., at the annual general meeting on Thursday:—**Associate Members.**—J. H. Buchanan, J. B. Bullock, A. Boyd. **Associate.**—E. G. Byng. **Graduates.**—E. Greenhalgh, A. J. Hainsworth, C. S. Hickie, A. A. Ahmed, E. J. Black, E. S. Bolton, F. L. Cater, E. E. Walker. **Students.**—D. K. Bhavé, K. Coombs, F. Frost, E. A. Hounsell, S. A. Kidvai, A. H. Leeves, J. C. Prescott, L. M. Barlow, B. Dennis, F. Malone, S. R. Mellonie, F. D. Moul, C. R. Taylor, H. V. Young.

CANDIDATES TRANSFERRED: *Associate Member to Member.*—L. H. Combe, J. W. Saaler, J. F. Crowley. *Associate to Member.*—J. W. Punter. *Student to Associate Member.*—A. C. Fendick, F. T. Gerstenberg, R. E. Dickinson, N. F. Hecht, C. E. Robertson, R. H. Vaudrey. *Student to Graduate.*—S. K. Chatterjee, C. G. Saltren-Willett, C. A. Smiles, G. D. Aspland, E. A. Elliman, H. J. Henwood, S. R. Sahgal.

ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Published on the First Thursday of each month

■ COLLIERY LIGHTING

A PAPER on colliery electric lighting, by Mr. C. S. Corlett, was read recently at a joint meeting of the North Staffordshire Branches of the National Association of Colliery Managers and the Association of Mining Electrical Engineers. The author described some early experiences with underground and surface lighting as far back as 1888, and went on to refer to the Home Office Rules with regard to underground lighting. While there might be differences of opinion, he said, on points of detail, the main principles were such as to ensure good and reliable work. The Home Office Factory Rules should be followed for surface work. The essentials of a properly-arranged distribution system were : That feeder cables should be run from a main switchboard or main control board to suitable double-pole distributing fuse-boxes; that no lamps should be connected to the feeder circuits; and that branch circuits for not more than 10 points should be run from the distribution boxes to the lamps. In the author's opinion, the best method of protecting the internal wiring at a colliery was by means of well-arranged screwed piping, and for particularly exposed or damp situations, galvanised piping. Open wiring supported on cleat or other types of insulators had given reasonably satisfactory results, yet the absence of mechanical protection to the wires was a serious objection. A frequent example of bad workmanship was the indiscriminate bunching of wires at the back of switchboards, or in the vicinity of distributing centres. Plain pendant fittings were unsuited to dusty situations; it was better to use totally enclosed dustproof fittings. Where there was much vibration, short lengths of metallic flexible tubing would prevent damage to the lamps.

Although the standard of maintenance was improving, the following practices were often observed :—The use of fuse wire of incorrect size; not keeping the box-covers properly screwed down so as to exclude dust; and omission to replace broken outer globes. The author considered that better results would be obtained by improving the status of the colliery electrician, whose remuneration was often quite inadequate, and by giving him actual instead of nominal charge of his department.

The carbon lamp might be said now to have had its day, and for present requirements only the metal filament lamp need be considered. In the smaller sizes, those for 100/110 volts were more satisfactory than those for 220/250 volts. The former was the most suitable pressure for colliery work, and could easily be provided on A.C. systems by transformers. In D.C. systems the problem was not so easy. It was not always economical to have separate plant for lighting, but a suitable lighting voltage could often be obtained by the use of a balancer. The arrangement of lamps in series on the power mains was not good practice. The use of 110 volts for lighting had the advantage that the rule as to earthing did not apply at this pressure. Self-contained lighting transformers, complete with switches and fuses in one cast-iron case with several compartments, could be conveniently used fixed alongside the ironclad power-control switches in the sub-stations and connected to the bus-bars through a few inches of piping. Rule 129 (c) stated that all conductors must be of the concentric type or provided with a metal covering, excepting only such portions of the low-tension system as are not fixed on roadways used for mechanical haulage, and where no danger exists for firing gas or other inflammable materials. The author further remarked that it is seldom desirable to limit the lighting system so that no portion of it will be on a haulage road—as excepting for loading into the cages it is probable that at the terminals of the haulages the greatest advantage of electric lighting accrues. It was, he said, undesirable to have a mixed system, that is to say, protected wires on one roadway, unprotected wiring on the next. It may therefore be concluded that, excepting concentric wiring, practically all colliery underground lighting must be protected with a metallic covering enclosing the whole of the conductors in the circuit. Speak-

ing broadly, the choice of this protection is limited to two types—steel tubing and armouring of the cables. Excepting on masonry or on the steel-girdered roofs of motor-houses the use of tubing is inadvisable.

The author has used twin-armoured conductors with satisfactory results. The conductors consist of circular twin V.I.R. cables, armoured and braided overall, and are carried on the usual form of suspender in convenient positions along the roadways, generally at the side, and as close to the roof as possible. At each lamp the branch distributor cable is cut and a circular galvanised-iron box is fitted, provided with suitable cover and suitable insulated connectors inside. In many cases an ordinary 3-way conduit box has been used. The insulated conductors are brought inside through a suitable gland, the armouring being terminated on the outside by a suitable armour clamp; the third or tee opening is provided with a short length of tubing, the other end of which is screwed into the lamp fitting. In cases where rigid tubing may be undesirable or difficult, short lengths of flexible tubing can be employed. At the last lamp on the circuit the blank outlet can be fitted with a plug, and at points where more than one lamp is required 4-way instead of 3-way boxes can be furnished. Only a small amount of concentric wiring has been carried out in collieries.

ELECTRIC POWER IN A SOUTH AFRICAN TIN MINE

A PAPER by Mr. W. Elsdon-Dew, published in the Transactions of the South African Institute of Electrical Engineers, describes the application of electrical power to the operations of Swaziland Tin, Ltd., M'Babane. The tin recovered is all alluvial, and occurs over a very wide area at points at considerable distances apart. Water power from one of the numerous streams from the eastern slopes of the Drakensberg range of mountains is utilised by a 300-h.p. Pelton wheel running under an effective head of 500 ft. at 500 r.p.m., and driving a 250-k.v.a. 550-volt 50-cycle three-phase alternator with a direct-coupled exciter. Power from this plant is transformed up by a single transformer to 3,300 volts and transmitted in different directions, the greatest distance being about 3½ miles, by overhead wires. Power is used for driving centrifugal gravel pumps and high-pressure nozzle pumps for sluicing down gravel. The exciter has a capacity in excess of the excitation requirements, and is used for station lighting and auxiliary services. The transmission line is of aluminium 7/0'114 sq. in., and in the particular circumstances a saving of 22 per cent. was made over the cost of an equivalent copper line, although the cost of supports and handling the aluminium was higher than it would have been for copper. The lines extend to three districts, named "Grey's Creek," "M'Babane Flats," and "King's Flats," where the workings for alluvial tin require motive power in some form or other. The tin is obtained out of the river wash in the following manner :—

The tin is finely divided in particles, varying from ¼-in. cubes down to very fine particles, and, being heavy, settles in the bottom of this stream, provided the method of handling allows for this. The usual method of washing down the river deposit and passing it through boxes containing riffles, &c., is adopted, but unless there is a considerable fall in the river-bed the débris soon chokes operations. Power is therefore used for raising the gravel out of the river-bed by means of gravel pumps to suitable places where the fall from the sluice-boxes is sufficient to get rid of the débris. The 8-in. pumps in use raise gravel, &c., to a height of 40 ft., and are specially made, having renewable shoes on the impellers and renewable liners in the casings.

The pumps are direct coupled to 50-h.p. motors, running at 480 r.p.m. The motors are 200 volts, and are supplied from a step-down transformer. The whole of this equipment is fixed on what is called a "pontoon." The overhead power line is brought within a distance of about 80 yards

to the point where it is used, and a cable is connected to the line through controlling links and brought to the pontoon and connected through oil switches, &c., to the apparatus. The pontoons are square wooden structures, heavily built, and are about 18 ft. square, containing the pump and motor at one end, and the transformer and switch-gear at the other end. The lower portion of the pontoon is made water-tight, and has a displacement large enough to float the whole pontoon when necessary. The pontoon is enclosed and roofed in to protect electrical apparatus from the weather. During operations it rests on a flat area of ground prepared for it, the suction pipe being taken to a suitable sump dug out in the river-bed, while the delivery pipe is taken to the head box which feeds the sluice-boxes, &c. The high-pressure water service used for "hydraulicing" is obtained from water-races, and the most advantageous pressure is about 70 lb. per sq. in.; but although the Swaziland Tin, Ltd., is fortunate in having, for most of its workings, such water supply, there are instances where such water pressure is not available, and in these instances pressure obtained by a high lift pump is resorted to. Such pumps supply approximately 700 gallons per minute at 70 lb. pressure at the nozzle, and are driven by 100-h.p. motors. Another instance where artificial pressure has to be obtained during the dry season is where a direct-coupled pump is also placed on one of the pontoons, and the pump drawing its water from a dam where settled water is obtained, and the delivery pipe line is within easy distance of the working face.

The Engineer's report of the working of the apparatus shows a considerable gain in efficiency since installing the electrical plant. In fact, the gravel pumps actually did 60 per cent. more work than the hydraulic elevator for a given quantity of water power, whilst, of course, the same water (which formerly ran to waste) after generating power for the gravel pumps is used in breaking and elevating ground.

ELECTRICAL MINING AND METALLURGICAL PATENTS OF MAY

Mining.

IN Specification No. 17,889 of 1913, H. H. Hirsch describes a form of electric lamp for mounting on a miner's cap in a hermetically sealed case with reflector and lens, provided with an internal switch normally operated from outside, but arranged so as to break the circuit on fracture of a thin panel of glass behind the lens, which breaks when the case is deformed by a blow.

In No. 9,542 of 1914, A. Mond describes a method of flame-tight protection of motors communicated by the Oerlikon Co. (Switzerland). This is a form of "plate protection" in which the openings are protected by layers of sheet-steel built of short lengths, spaced apart by the interposition of other plates only at the ends. By this means more accurate spacing is attained than by the use of plates the full width of the aperture to be protected.

A form of relay for mine signalling is described by H. Davies and M. J. Railing in Specification No. 10,549 of 1914. The electromagnet has two parallel limbs, and a special shaped armature is mounted on an axis parallel to the limbs, and is rotatable in front of a parallel to the pole-faces. This works a contact which controls the circuit. The magnet limbs have a short-circuited winding or conducting sleeve, which limits the inductive rise of voltage to an extent which renders the external spark where the circuit is broken free from liability to cause ignition of gas.

Specification No. 11,599 of 1914 of L. Bristol describes an electric miner's safety lamp, among the features of which are a strip of acid-proof material between the vent holes and the terminals, and a hinged cover adapted to be locked in position and provided with additional locking means which must be operated before the cover can be moved on its hinge, and having mounted thereon a gas-tight rotary or partly rotary switch. The cover rests on a rim which maintains the lamp-support and guard in position, and is provided with a projecting pin which coincides with a hole in a movable slide locked in position by the closing of the cover.

Electro-metallurgical.

In Specification No. 18,538 of 1914, A. P. Strohmenger describes an improved method of arc welding or fusion deposition of metals, in which an electrode is used of the

material to be deposited, and certain difficulties are overcome by incorporating in the electrode a strip of aluminium or other suitable material having a strong reducing effect at the arc temperature.

Safety Lamps for Mines.—One of the flame lamps recently approved for use in mines by the Home Office is noticeable for having a small electric lamp of the "torch" type, with a primary battery attached to it for use in emergencies when the flame becomes extinguished. This torch is mounted on a pivot to throw light in any direction, and is approved subject to the conditions that "the cover of the battery case is securely soldered on, that the protecting glass is securely fastened and forms a flame-tight joint with the case, and that the push switch is flame-tight."

Electric Mining Regulations and Data.—A very convenient little pocket-book with this title is being issued by W. T. Glover and Co., Ltd. (Trafford Park, Manchester). It contains the latest Home Office regulations in full with the official explanatory memorandum thereon, as well as a quantity of data of utility to the mining electrical engineer, especially in relation to the choice of cables. A selection of illustrations of typical cables, accessories, and fittings are also given.

The Electric Vehicle Committee.—At a recent meeting of this Committee arrangements were discussed for the proposed Parade of Electric Vehicles on June 17th, and the time was provisionally fixed for 5 p.m. Application will be made for permission from the police for the Parade to be held on the Embankment. The Technical Sub-Committee have now completed the preparation of the report upon "Methods of Charging and Charging Equipment." As to further standardising of details appertaining to lead plate batteries, the Committee has decided to ask the Accumulator Section of the B.E.A.M.A. to consider the desirability of bringing about standardisation in regard to:—The clearance for the accumulation of sludge between the lower edge of the plates and the bottom of the cell container; the size of the filler plug hole and the design of the plug; the distance between the top of the lip of the plug hole and the top edges of the plates, so that one gauge may always be used in a garage for fixing the proper level of the electrolyte, measuring from the top edge of the filler hole lip, and details of connectors between cells and method of connecting these to the plate terminals. The next meeting of the Committee was fixed for 3 p.m. on June 11th, 1915.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,445.

Explain how to reverse the direction of rotation of a single-phase induction motor with squirrel-cage rotor, also of a single-phase repulsion motor with a D.C. armature, which is permanently short-circuited.—"J. B."

(Replies must be received not later than first post, Thursday, June 10th.)

ANSWERS TO No. 1,443.

No reply of sufficient merit for an award has been received.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The following description of wireless communication from German submarines, extracted from an Irish contemporary, may amuse our readers:—"In the Furken Telegraaf system employed by the Germans a high aerial is not required, and it is probable that this fact has enabled them to use it on submarines floating on the surface. From the top of a pole of no great length a small captive balloon is sent into the air, and the wire from the transmitting instrument runs only to the pole. As the message leaves the instrument it goes to the pole, and from there is extracted to the balloon by means of a magnet, which re-transmits it by means of flashes to another similar installation."

The directors of the Constantinople Telephone Co. have issued a circular to their shareholders, in which they refer to the fact that the General Manager (Mr. Douglas Watson) and the British staff were expelled from the Company's premises in Constantinople, and have now arrived in England. The Constantinople directors have protested to the Turkish Government, and it is hoped that it will soon be possible for the British staff to return, and for the Company to resume possession of its plant. An endeavour is also to be made to obtain reparation for the loss inflicted by the action of the Turkish Government. The matter is receiving the careful consideration of the European directors, and every possible step has been and will be taken to protect the interests of the shareholders and bondholders.

The Chicago Journal *Telephony* of April 24th contains an exceedingly useful article by Mr. W. N. Furthmann, describing the design and construction of loading coils used in America. It is devoted to the mechanical construction rather than the electrical design of these coils, although mention is made incidentally of the fact that the coils are divided into seven sections (14 in the case of the coils for the "phantom" circuit) to avoid cross-talk. The coils are mounted on wooden dowels clamped at the top and to an

iron spider, but separated from it by wooden washers, and at the lower end a wooden nut is used for clamping the dowel to the case. This is to avoid eddy currents, as the case is of iron for mechanical reasons. Two fibre washers with an iron washer between them are placed between the coils, the iron acting as magnetic shields between the coils. All these parts, and the method of assembling, mounting, and cabling have been standardised, as have also been, to a large extent, the cases for containing the loading coils for land-lines, underground, and submarine cables respectively.

A Paper on "Wireless Call Devices," by Mr. L. B. Turner, was read at a recent meeting of the Institution of Post Office Electrical Engineers. The author said that the primary difficulty in devising an effective call apparatus was the extreme smallness of the power available, and a secondary difficulty was how to avoid fake calls actuated by foreign wireless stations discharging their ordinary traffic or by atmospherics. He reviewed a number of directions in which attempts had been made to actuate a call signal by received messages. It was comparatively easy to actuate a bell by the old style of coherer, but such a receiver was not nearly sensitive enough for present-day work. The power received by the ordinary telephone was not of the order required to actuate the usual Post Office relay, but such instruments as the Orling jet relay, the Brown telephone relay, the Heurtley amplifier, depending on the change of resistance, produced in a hot thin platinum wire when slightly displaced across the edge of a blast of cold air, or the Lieben-Reiss vacuum-tube amplifier, might be employed. A certain amount of selectivity was necessary, and the simplest arrangement was to use a long "dash" as the call signal, and to arrange the receiving apparatus so that it did not respond to a short signal. Another method depended on musical note syntaxy, and an analogous device was that responding only to "dashes" at regular intervals. There was considerable need for a reliable call apparatus in out-of-the-way Post Office stations, and an appliance was shown which had been developed for the purpose. In the apparatus a clock switches in a crystal detector circuit with a very sensitive slow-period galvanometer in place of the telephone for $7\frac{1}{2}$ seconds four times an hour, and when the sending key is depressed throughout this period the galvanometer needle is deflected into a position between two jaws of a hit-and-miss device actuated by a local current. When the needle is in its deflected position, the closing of the jaws is without effect, for the jaws are slightly staggered, but if the needle is in place between them, it is gripped and a local circuit is closed, ringing a bell. A second crystal detector is provided, and the two are automatically switched in alternately by an ingenious mercury-actuated switch in case of one being damaged by atmospherics. Another apparatus was also described, in which the swing of a galvanometer is gradually built up from the sending station by keeping the key depressed every alternate five seconds. With a signal of .063 microampere a call can be made in this way in $2\frac{1}{2}$ minutes.

The appointment of Sir Henry Jackson to succeed Lord Fisher as First Sea Lord of the Admiralty recalls that Sir Henry was the first to develop the use of wireless telegraphy in the Navy. His first experiments were carried out in the early 'nineties, and by the time he worked in conjunction with Mr. Marconi, in 1896, he was able to communicate from one end of a ship to the other. Sir Henry Jackson relinquished the control of wireless telegraphy in the Navy in 1906, when he was appointed Rear-Admiral.

Diesel Engine Users' Association.—At the May meeting of the Diesel Engine Users' Association the President reported that particulars of the scheme of insurance at Lloyds against breakdown had been sent out to all the members. The question of a suitable allowance to be made for depreciation of Diesel engine plant in connection with income tax assessment was discussed, and its further consideration was adjourned for the following meeting. The subject of lubrication of Diesel engines was further dealt with. Replies and information on several interesting points had been received from many of the members of the Association, and much valuable information had been obtained as to the various methods of lubricating, the costs per unit generated, comparative costs of lubrication as compared with fuel oil used, the practice in regard to withdrawal of pistons for examination, &c. It was decided to extend the time for sending in returns from other undertakings, and to ask for some further information in certain cases, so as to obtain results which would represent general practice as far as possible. At the next meeting of the Association on Wednesday, June 16th, the question of cracked pistons will come up for discussion. Information and particulars concerning the Association can be obtained from the acting hon. secretary, Mr. Percy Still, 19 Cadogan Gardens, London, S.W.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 27th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

7,298/14. Lamp-holders. R. B. BENJAMIN. Edison screw lamp-holders provided with springs for clamping the lamp against loosening by vibration. The springs project through slots in the screwed contact sleeve and bear on the lamp cap. Several patterns of spring are described. (Nine figures.)

11,083/14. Travelling Searchlights. Soc. ANON. DES AUTOMOBILES & CYCLES PEUGEOT. A motor vehicle in which a petrol engine is employed for driving a dynamo, as well as for propulsion. The projector is mounted on a wheeled truck, which is carried complete on the rear part of the vehicle, and an inclined track can be lowered to let down or take up the truck with the aid of a windlass. (Seven figures.)

11,399/14. Constant Voltage Generator. CROMPTON & Co., LTD., and N. PENSABENE. A self-regulating D.C. generator in which the brushes are placed at an angle of 60° or 70° with the neutral position, and a number of equally spaced tappings on the armature winding are connected by non-inductive resistances so that the combination of the A.C. and D.C. reactions produces a compensating effect. (One figure.)

14,159/14. Fuses. A. H. RAILING and C. C. GARRARD. Fuses of the hand-shield type with ventilating channels in the contact blocks. The blocks are mounted on the carrier, and support between them, by means of holes in their ends, asbestos protecting tubes. (One figure.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

DYNAMOS, MOTORS, and TRANSFORMERS: B.T.-H. Co. and CLOUGH [Protective devices for alternators] 11,436/14.

Electrometallurgy and Electrochemistry: HANRIOT [Electrochemical treatment of ores] 11,950/14.

Heating and Cooking: MILLER and MILLER [Electrically heated shaving-pots] 22,915/14; VANDERVELL [Cigar-lighters] 3,672/14.

Switchgear, Fuses, and Fittings: MORRIS and MORRIS & LISTER, LTD. [Circuit-breakers] 11,794/14; B.T.-H. Co. (G.E.CO., U.S.A.)

ELECTRIC TRACTION NOTES

Among the features of novelty in the passenger cars of the New York Municipal Railway Corporation, described in the *Electric Railway Journal*, are an automatic adjustment of the brake cylinder pressure according to the load in the car actuated by the deformation of the springs while the car is standing with the doors open; an automatic coupler which couples up all the brake pipes and electrical connections in the same operation as the main coupling; electro-pneumatic door operation with push-button control; and an automatic arrangement whereby the head and tail lights are caused both to show red when the reversing handle of the controller is put in the centre position, and when the train is broken the red lights at the point of separation automatically light up. When the controller is put in the running position the lights in the corresponding forward end of the train light up white. Another important feature is the automatic speed-control and cab-signalling system, which supplements the ordinary fixed signals and train stops, and gives the driver information as to when to apply brakes, when to resume normal speed, the permissible speed, the available braking distance, &c. This is contrived with a speed-control

[Protective devices] 11,832/14; RAILING and TAYLOR [Conduits] 18,143/14; MIDGEY and VANDERVELL [Automatic cut-outs] 21,488/14; BARNUM and DATE [Switches] 22,435/14.

Telephony and Telegraphy: ARNO [Generating oscillations] 11,928/14; MANDERS [Method of producing oscillatory currents of small decrement and close wave trains] 11,934/14; COHEN [Production of oscillatory currents of high frequency] 18,433/14.

Traction: BILES [Petrol-electric system] 10,275/14; B.T.-H. Co. (G.E. Co., U.S.A.) [Traction insulators] 11,739/14.

Miscellaneous: LICHTENFELD BURGLAR ALARM Co. and LICHTFIELD [Burglar alarms] 16,853/14; BENITEZ [System for the generation of electric currents] 17,811/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Ignition: TEBBITT [Ignition devices] 5,850/15.
Instruments, Meters, &c.: WESSEL [Coin operated meter] 6,685/15.

Telephony and Telegraphy: GOLDSCHMIDT [Mechanical selector for electromagnetic waves applicable to wireless receiving apparatus] 15,082/14.

Application for Restoration of Lapsed Patent

17,817/07. Mounting of Metal Filaments. A. C. HYDE and VACTITE WIRE Co., LTD. Application has been made for the restoration of this patent, which had been allowed to lapse. The specification describes a method of fixing metal filaments to the supporting wires by a paste containing gelatinous metallic hydrates, afterwards acted upon by an arc in hydrogen. Opposition to the restoration must be entered by July 27th.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: L. C. H. MENSING [Flame arc lamps] 3,243/04 and [Arc lamp magazine] 25,373/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: C. J. BEAVER and E. A. CLAREMONT [Oil-proof coating between the indiarubber insulation and outer cover of cables] 2,747/05; E. WITZENMANN [Cable armouring] 3,257/09.

Dynamos, Motors and Transformers: E. S. G. REES [Dynamo frame] 3,157/05; W. GEIPEL and F. M. T. LANGE [D.C. motor control] 3,177/05; B.T.-H. Co. (G.E. Co., U.S.A.) [A.C. motor control] 3,590/06.

Switchgear, Fuses and Fittings: C. H. PEARSON [Conduit tube joints] 3,520/07.

Telephony and Telegraphy: G. W. PICKARD [Wireless receiver] 2,943/08.

Traction: W. M. MORDEY [A.C. traction booster system] 3,748/02; H. LEITNER [Train lighting dynamo] 3,391/08.

system which automatically applies the brakes if the driver fails to obey the cab-signal indications and the speed of the car at any point is in excess of that established by a pre-determined braking curve. The apparatus involves a centrifugal governor acting in conjunction with a cam of special form and certain relays and contacts, and is not as complicated as might appear at first sight.

An agreement has been come to between the new Plymouth Corporation and the Devonport & District Tramways Co. for the sale of the Company's undertaking to the Corporation on Tramway Act terms. The arrangement at present is that the Company's line shall be transferred to the Corporation on October 7th, the price to be fixed by arbitration.

The strike of the London County Council tramwaymen came to a sudden termination on Saturday, when the unions instructed the men to return to work. A message to that effect was therefore telephoned to Mr. A. L. C. Fell, the Chief Officer. Meanwhile, the L.C.C. had issued a notice that no man of military age would be re-engaged, and some trouble arose on Sunday and Monday in regard to this. The result was that the union called out the men again, but the L.C.C., whilst not modifying its attitude, has agreed to consider reasons put forward by any man of military age for not joining the Army. The men have also returned on the Metropolitan electric tramway system, it is said without restrictions as to age.

ELECTRICAL ENGINEERING IN THE MINING AND METAL INDUSTRIES

Published on the First Thursday of each month

■ COLLIERY LIGHTING

A PAPER on colliery electric lighting, by Mr. C. S. Corlett, was read recently at a joint meeting of the North Staffordshire Branches of the National Association of Colliery Managers and the Association of Mining Electrical Engineers. The author described some early experiences with underground and surface lighting as far back as 1883, and went on to refer to the Home Office Rules with regard to underground lighting. While there might be differences of opinion, he said, on points of detail, the main principles were such as to ensure good and reliable work. The Home Office Factory Rules should be followed for surface work. The essentials of a properly-arranged distribution system were: That feeder cables should be run from a main switchboard or main control board to suitable double-pole distributing fuse-boxes; that no lamps should be connected to the feeder circuits; and that branch circuits for not more than 10 points should be run from the distribution boxes to the lamps. In the author's opinion, the best method of protecting the internal wiring at a colliery was by means of well-arranged screwed piping, and for particularly exposed or damp situations, galvanised piping. Open wiring supported on cleat or other types of insulators had given reasonably satisfactory results, yet the absence of mechanical protection to the wires was a serious objection. A frequent example of bad workmanship was the indiscriminate bunching of wires at the back of switchboards, or in the vicinity of distributing centres. Plain pendant fittings were unsuited to dusty situations; it was better to use totally enclosed dustproof fittings. Where there was much vibration, short lengths of metallic flexible tubing would prevent damage to the lamps.

Although the standard of maintenance was improving, the following practices were often observed:—The use of fuse wire of incorrect size; not keeping the box-covers properly screwed down so as to exclude dust; and omission to replace broken outer globes. The author considered that better results would be obtained by improving the status of the colliery electrician, whose remuneration was often quite inadequate, and by giving him actual instead of nominal charge of his department.

The carbon lamp might be said now to have had its day, and for present requirements only the metal filament lamp need be considered. In the smaller sizes, those for 100/110 volts were more satisfactory than those for 220/250 volts. The former was the most suitable pressure for colliery work, and could easily be provided on A.C. systems by transformers. In D.C. systems the problem was not so easy. It was not always economical to have separate plant for lighting, but a suitable lighting voltage could often be obtained by the use of a balancer. The arrangement of lamps in series on the power mains was not good practice. The use of 110 volts for lighting had the advantage that the rule as to earthing did not apply at this pressure. Self-contained lighting transformers, complete with switches and fuses in one cast-iron case with several compartments, could be conveniently used fixed alongside the ironclad power-control switches in the sub-stations and connected to the bus-bars through a few inches of piping. Rule 129 (c) stated that all conductors must be of the concentric type or provided with a metal covering, excepting only such portions of the low-tension system as are not fixed on roadways used for mechanical haulage, and where no danger exists for firing gas or other inflammable materials. The author further remarked that it is seldom desirable to limit the lighting system so that no portion of it will be on a haulage road—as excepting for loading into the cages it is probable that at the terminals of the haulages the greatest advantage of electric lighting accrues. It was, he said, undesirable to have a mixed system, that is to say, protected wires on one roadway, unprotected wiring on the next. It may therefore be concluded that, excepting concentric wiring, practically all colliery underground lighting must be protected with a metallic covering enclosing the whole of the conductors in the circuit. Speak-

ing broadly, the choice of this protection is limited to two types—steel tubing and armouring of the cables. Excepting on masonry or on the steel-girdered roofs of motor-houses the use of tubing is inadvisable.

The author has used twin-armoured conductors with satisfactory results. The conductors consist of circular twin V.I.R. cables, armoured and braided overall, and are carried on the usual form of suspender in convenient positions along the roadways, generally at the side, and as close to the roof as possible. At each lamp the branch distributor cable is cut and a circular galvanised-iron box is fitted, provided with suitable cover and suitable insulated connectors inside. In many cases an ordinary 3-way conduit box has been used. The insulated conductors are brought inside through a suitable gland, the armouring being terminated on the outside by a suitable armour clamp; the third or tee opening is provided with a short length of tubing, the other end of which is screwed into the lamp fitting. In cases where rigid tubing may be undesirable or difficult, short lengths of flexible tubing can be employed. At the last lamp on the circuit the blank outlet can be fitted with a plug, and at points where more than one lamp is required 4-way instead of 3-way boxes can be furnished. Only a small amount of concentric wiring has been carried out in collieries.

ELECTRIC POWER IN A SOUTH AFRICAN TIN MINE

A PAPER by Mr. W. Elsdon-Dew, published in the Transactions of the South African Institute of Electrical Engineers, describes the application of electrical power to the operations of Swaziland Tin, Ltd., M'Babane. The tin recovered is all alluvial, and occurs over a very wide area at points at considerable distances apart. Water power from one of the numerous streams from the eastern slopes of the Drakensberg range of mountains is utilised by a 300-h.p. Pelton wheel running under an effective head of 500 ft. at 500 r.p.m., and driving a 250-k.v.a. 550-volt 50-cycle three-phase alternator with a direct-coupled exciter. Power from this plant is transformed up by a single transformer to 3,300 volts and transmitted in different directions, the greatest distance being about 3½ miles, by overhead wires. Power is used for driving centrifugal gravel pumps and high-pressure nozzle pumps for sluicing down gravel. The exciter has a capacity in excess of the excitation requirements, and is used for station lighting and auxiliary services. The transmission line is of aluminium 7'0 11¼ sq. in., and in the particular circumstances a saving of 22 per cent. was made over the cost of an equivalent copper line, although the cost of supports and handling the aluminium was higher than it would have been for copper. The lines extend to three districts, named "Grey's Creek," "M'Babane Flats," and "King's Flats," where the workings for alluvial tin require motive power in some form or other. The tin is obtained out of the river wash in the following manner:—

The tin is finely divided in particles, varying from $\frac{1}{4}$ -in. cubes down to very fine particles, and, being heavy, settles in the bottom of this stream, provided the method of handling allows for this. The usual method of washing down the river deposit and passing it through boxes containing riffles, &c., is adopted, but unless there is a considerable fall in the river-bed the debris soon chokes operations. Power is therefore used for raising the gravel out of the river-bed by means of gravel pumps to suitable places where the fall from the sluice-boxes is sufficient to get rid of the debris. The 8-in. pumps in use raise gravel, &c., to a height of 40 ft., and are specially made, having renewable shoes on the impellers and renewable liners in the casings.

The pumps are direct coupled to 50-h.p. motors, running at 480 r.p.m. The motors are 200 volts, and are supplied from a step-down transformer. The whole of this equipment is fixed on what is called a "pontoon." The overhead power line is brought within a distance of about 60 yards

to the point where it is used, and a cable is connected to the line through controlling links and brought to the pontoon and connected through oil switches, &c., to the apparatus. The pontoons are square wooden structures, heavily built, and are about 18 ft. square, containing the pump and motor at one end, and the transformer and switch-gear at the other end. The lower portion of the pontoon is made water-tight, and has a displacement large enough to float the whole pontoon when necessary. The pontoon is enclosed and roofed in to protect electrical apparatus from the weather. During operations it rests on a flat area of ground prepared for it, the suction pipe being taken to a suitable sump dug out in the river-bed, while the delivery pipe is taken to the head box which feeds the sluice-boxes, &c. The high-pressure water service used for "hydraulicing" is obtained from water-races, and the most advantageous pressure is about 70 lb. per sq. in.; but although the Swaziland Tin, Ltd., is fortunate in having, for most of its workings, such water supply, there are instances where such water pressure is not available, and in these instances pressure obtained by a high lift pump is resorted to. Such pumps supply approximately 700 gallons per minute at 70 lb. pressure at the nozzle, and are driven by 100-h.p. motors. Another instance where artificial pressure has to be obtained during the dry season is where a direct-coupled pump is also placed on one of the pontoons, and the pump drawing its water from a dam where settled water is obtained, and the delivery pipe line is within easy distance of the working face.

The Engineer's report of the working of the apparatus shows a considerable gain in efficiency since installing the electrical plant. In fact, the gravel pumps actually did 60 per cent. more work than the hydraulic elevator for a given quantity of water power, whilst, of course, the same water (which formerly ran to waste) after generating power for the gravel pumps is used in breaking and elevating ground.

ELECTRICAL MINING AND METALLURGICAL PATENTS OF MAY

Mining.

IN Specification No. 17,889 of 1913, H. H. Hirsch describes a form of electric lamp for mounting on a miner's cap in a hermetically sealed case with reflector and lens, provided with an internal switch normally operated from outside, but arranged so as to break the circuit on fracture of a thin panel of glass behind the lens, which breaks when the case is deformed by a blow.

In No. 9,542 of 1914, A. Mond describes a method of flame-tight protection of motors communicated by the Oerlikon Co. (Switzerland). This is a form of "plate protection" in which the openings are protected by layers of sheet-steel built of short lengths, spaced apart by the interposition of other plates only at the ends. By this means more accurate spacing is attained than by the use of plates the full width of the aperture to be protected.

A form of relay for mine signalling is described by H. Davies and M. J. Railing in Specification No. 10,549 of 1914. The electromagnet has two parallel limbs, and a special shaped armature is mounted on an axis parallel to the limbs, and is rotatable in front of a parallel to the pole-faces. This works a contact which controls the circuit. The magnet limbs have a short-circuited winding or conducting sleeve, which limits the inductive rise of voltage to an extent which renders the external spark where the circuit is broken free from liability to cause ignition of gas.

Specification No. 11,599 of 1914 of L. Bristol describes an electric miner's safety lamp, among the features of which are a strip of acid-proof material between the vent holes and the terminals, and a hinged cover adapted to be locked in position and provided with additional locking means which must be operated before the cover can be moved on its hinge, and having mounted thereon a gas-tight rotary or partly rotary switch. The cover rests on a rim which maintains the lamp-support and guard in position, and is provided with a projecting pin which coincides with a hole in a movable slide locked in position by the closing of the cover.

Electro-metallurgical.

In Specification No. 13,538 of 1914, A. P. Strohmenger describes an improved method of arc welding or fusion deposition of metals, in which an electrode is used of the

material to be deposited, and certain difficulties are overcome by incorporating in the electrode a strip of aluminium or other suitable material having a strong reducing effect at the arc temperature.

Safety Lamps for Mines.—One of the flame lamps recently approved for use in mines by the Home Office is noticeable for having a small electric lamp of the "torch" type, with a primary battery attached to it for use in emergencies when the flame becomes extinguished. This torch is mounted on a pivot to throw light in any direction, and is approved subject to the conditions that "the cover of the battery case is securely soldered on, that the protecting glass is securely fastened and forms a flame-tight joint with the case, and that the push switch is flame-tight."

Electric Mining Regulations and Data.—A very convenient little pocket-book with this title is being issued by W. T. Glover and Co., Ltd. (Trafford Park, Manchester). It contains the latest Home Office regulations in full with the official explanatory memorandum thereon, as well as a quantity of data of utility to the mining electrical engineer, especially in relation to the choice of cables. A selection of illustrations of typical cables, accessories, and fittings are also given.

The Electric Vehicle Committee.—At a recent meeting of this Committee arrangements were discussed for the proposed Parade of Electric Vehicles on June 17th, and the time was provisionally fixed for 5 p.m. Application will be made for permission from the police for the Parade to be held on the Embankment. The Technical Sub-Committee have now completed the preparation of the report upon "Methods of Charging and Charging Equipments." As to further standardising of details appertaining to lead plate batteries, the Committee has decided to ask the Accumulator Section of the B.E.A.M.A. to consider the desirability of bringing about standardisation in regard to:—The clearance for the accumulation of sludge between the lower edge of the plates and the bottom of the cell container; the size of the filler plug hole and the design of the plug; the distance between the top of the lip of the plug hole and the top edges of the plates, so that one gauge may always be used in a garage for fixing the proper level of the electrolyte, measuring from the top edge of the filler hole lip, and details of connectors between cells and method of connecting these to the plate terminals. The next meeting of the Committee was fixed for 3 p.m. on June 11th, 1915.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,443.

Explain how to reverse the direction of rotation of a single-phase induction motor with squirrel-cage rotor, also of a single-phase repulsion motor with a D.C. armature, which is permanently short-circuited.—"J. B."

(Replies must be received not later than first post, Thursday, June 10th.)

ANSWERS TO No. 1,443.

No reply of sufficient merit for an award has been received.

TELEPHONY AND TELEGRAPHY (INCLUDING WIRELESS)

The following description of wireless communication from German submarines, extracted from an Irish contemporary, may amuse our readers:—"In the Furken Telegraaf system employed by the Germans a high aerial is not required, and it is probable that this fact has enabled them to use it on submarines floating on the surface. From the top of a pole of no great length a small captive balloon is sent into the air, and the wire from the transmitting instrument runs only to the pole. As the message leaves the instrument it goes to the pole, and from there is extracted to the balloon by means of a magnet, which re-transmits it by means of flashes to another similar installation."

The directors of the Constantinople Telephone Co. have issued a circular to their shareholders, in which they refer to the fact that the General Manager (Mr. Douglas Watson) and the British staff were expelled from the Company's premises in Constantinople, and have now arrived in England. The Constantinople directors have protested to the Turkish Government, and it is hoped that it will soon be possible for the British staff to return, and for the Company to resume possession of its plant. An endeavour is also to be made to obtain reparation for the loss inflicted by the action of the Turkish Government. The matter is receiving the careful consideration of the European directors, and every possible step has been and will be taken to protect the interests of the shareholders and bondholders.

The Chicago Journal *Telephony* of April 24th contains an exceedingly useful article by Mr. W. N. Furthmann, describing the design and construction of loading coils used in America. It is devoted to the mechanical construction rather than the electrical design of these coils, although mention is made incidentally of the fact that the coils are divided into seven sections (14 in the case of the coils for the "phantom" circuit) to avoid cross-talk. The coils are mounted on wooden dowels clamped at the top and to an

iron spider, but separated from it by wooden washers, and at the lower end a wooden nut is used for clamping the dowel to the case. This is to avoid eddy currents, as the case is of iron for mechanical reasons. Two fibre washers with an iron washer between them are placed between the coils, the iron acting as magnetic shields between the coils. All these parts, and the method of assembling, mounting, and cabling have been standardised, as have also been, to a large extent, the cases for containing the loading coils for land-lines, underground, and submarine cables respectively.

A Paper on "Wireless Call Devices," by Mr. L. B. Turner, was read at a recent meeting of the Institution of Post Office Electrical Engineers. The author said that the primary difficulty in devising an effective call apparatus was the extreme smallness of the power available, and a secondary difficulty was how to avoid fake calls actuated by foreign wireless stations discharging their ordinary traffic or by atmospherics. He reviewed a number of directions in which attempts had been made to actuate a call signal by received messages. It was comparatively easy to actuate a bell by the old style of coherer, but such a receiver was not nearly sensitive enough for present-day work. The power received by the ordinary telephone was not of the order required to actuate the usual Post Office relay, but such instruments as the Orling jet relay, the Brown telephone relay, the Heurtley amplifier, depending on the change of resistance, produced in a hot thin platinum wire when slightly displaced across the edge of a blast of cold air, or the Lieben-Reiss vacuum-tube amplifier, might be employed. A certain amount of selectivity was necessary, and the simplest arrangement was to use a long "dash" as the call signal, and to arrange the receiving apparatus so that it did not respond to a short signal. Another method depended on musical note syntony, and an analogous device was that responding only to "dashes" at regular intervals. There was considerable need for a reliable call apparatus in out-of-the-way Post Office stations, and an appliance was shown which had been developed for the purpose. In the apparatus a clock switches in a crystal detector circuit with a very sensitive slow-period galvanometer in place of the telephone for $7\frac{1}{2}$ seconds four times an hour, and when the sending key is depressed throughout this period the galvanometer needle is deflected into a position between two jaws of a hit-and-miss device actuated by a local current. When the needle is in its deflected position, the closing of the jaws is without effect, for the jaws are slightly staggered, but if the needle is in place between them, it is gripped and a local circuit is closed, ringing a bell. A second crystal detector is provided, and the two are automatically switched in alternately by an ingenious mercury-actuated switch in case of one being damaged by atmospherics. Another apparatus was also described, in which the swing of a galvanometer is gradually built up from the sending station by keeping the key depressed every alternate five seconds. With a signal of .063 microampere a call can be made in this way in $2\frac{1}{2}$ minutes.

The appointment of Sir Henry Jackson to succeed Lord Fisher as First Sea Lord of the Admiralty recalls that Sir Henry was the first to develop the use of wireless telegraphy in the Navy. His first experiments were carried out in the early 'nineties, and by the time he worked in conjunction with Mr. Marconi, in 1896, he was able to communicate from one end of a ship to the other. Sir Henry Jackson relinquished the control of wireless telegraphy in the Navy in 1906, when he was appointed Rear-Admiral.

Diesel Engine Users' Association.—At the May meeting of the Diesel Engine Users' Association the President reported that particulars of the scheme of insurance at Lloyds against breakdown had been sent out to all the members. The question of a suitable allowance to be made for depreciation of Diesel engine plant in connection with income tax assessment was discussed, and its further consideration was adjourned for the following meeting. The subject of lubrication of Diesel engines was further dealt with. Replies and information on several interesting points had been received from many of the members of the Association, and much valuable information had been obtained as to the various methods of lubricating, the costs per unit generated, comparative costs of lubrication as compared with fuel oil used, the practice in regard to withdrawal of pistons for examination, &c. It was decided to extend the time for sending in returns from other undertakings, and to ask for some further information in certain cases, so as to obtain results which would represent general practice as far as possible. At the next meeting of the Association on Wednesday, June 16th, the question of cracked pistons will come up for discussion. Information and particulars concerning the Association can be obtained from the acting hon. secretary, Mr. Percy Still, 19 Cadogan Gardens, London, S.W.

"ELECTRICAL ENGINEERING" PATENT RECORD

(This Patent Record is compiled by our own Editorial Staff and is Strictly Copyright.)

Specifications Published May 27th, 1915

A full list of electrical patents published last week appeared in our last issue. The following are abstracts of some of the more important specifications.

Names in italics indicate communicators of inventions from abroad.

7,298/14. Lamp-holders. R. B. BENJAMIN. Edison screw lamp-holders provided with springs for clamping the lamp against loosening by vibration. The springs project through slots in the screwed contact sleeve and bear on the lamp cap. Several patterns of spring are described. (Nine figures.)

11,083/14. Travelling Searchlights. Soc. ANON. DES AUTOMOBILES & CYCLES PEUGEOT. A motor vehicle in which a petrol engine is employed for driving a dynamo, as well as for propulsion. The projector is mounted on a wheeled truck, which is carried complete on the rear part of the vehicle, and an inclined track can be lowered to let down or take up the truck with the aid of a windlass. (Seven figures.)

11,399/14. Constant Voltage Generator. CROMPTON & Co., LTD., and N. PENSABENE. A self-regulating D.C. generator in which the brushes are placed at an angle of 60° or 70° with the neutral position, and a number of equally spaced tappings on the armature winding are connected by non-inductive resistances so that the combination of the A.C. and D.C. reactions produces a compensating effect. (One figure.)

14,159/14. Fuses. A. H. RAILING and C. C. GARRARD. Fuses of the hand-shield type with ventilating channels in the contact blocks. The blocks are mounted on the carrier, and support between them, by means of holes in their ends, asbestos protecting tubes. (One figure.)

Specifications Published To-Day

The following Patent Specifications will be published to-day, and will be on sale at the Patent Office Sales Branch, 25, Southampton Buildings, London, W.C., at the price of 6d. each, including inland postage.

Summaries of some of the more important of these Patents will appear in our next issue.

DYNAMOS, MOTORS, AND TRANSFORMERS: B.T.-H. Co. and CLOUGH [Protective devices for alternators] 11,436/14.

Electrometallurgy and Electrochemistry: HANRIOT [Electrochemical treatment of ores] 11,950/14.

Heating and Cooking: MILLER and MILLER [Electrically heated shaving-pots] 22,915/14; VANDERVELL [Cigar-lighters] 3,672/14.

Switchgear, Fuses, and Fittings: MORRIS and MORRIS & LISTER, LTD. [Circuit-breakers] 11,794/14; B.T.-H. Co. (G.E. Co., U.S.A.)

[Protective devices] 11,832/14; RAILING and TAYLOR [Conduits] 18,143/14; MIDGEY and VANDERVELL [Automatic cut-outs] 21,488/14; BARNUM and DATE [Switches] 22,435/14.

Telephony and Telegraphy: ARNO [Generating oscillations] 11,928/14; MANDERS [Method of producing oscillatory currents of small decrement and close wave trains] 11,934/14; COHEN [Production of oscillatory currents of high frequency] 19,433/14.

Traction: BILES [Petrol-electric system] 10,275/14; B.T.-H. Co. (G.E. Co., U.S.A.) [Traction insulators] 11,739/14.

Miscellaneous: LICHTENFELD BURGLAR ALARM Co. and LICHTFIELD [Burglar alarms] 16,833/14; BENITEZ [System for the generation of electric currents] 17,811/14.

The following Specifications are open to Inspection at the Patent Office before Acceptance, but are not yet published for sale.

Ignition: TEBBITT [Ignition devices] 5,850/15.

Instruments, Meters, &c.: WESSEL [Coin operated meter] 6,685/15.

Telephony and Telegraphy: GOLDSCHMIDT [Mechanical selector for electromagnetic waves applicable to wireless receiving apparatus] 15,082/14.

Application for Restoration of Lapsed Patent

17,817/07. Mounting of Metal Filaments. A. C. HYDE and VACTITE WIRE Co., LTD. Application has been made for the restoration of this patent, which had been allowed to lapse. The specification describes a method of fixing metal filaments to the supporting wires by a paste containing gelatinous metallic hydrates, afterwards acted upon by an arc in hydrogen. Opposition to the restoration must be entered by July 27th.

The following are the more important Patents that have become void through non-payment of renewal fees.

Arc Lamps: L. C. H. MENSING [Flame arc lamps] 3,243/04 and [Arc lamp magazine] 25,373/09.

Distributing Systems, Cables and Wires, Insulating Materials, &c.: C. J. BEAVER and E. A. CLAREMONT [Oil-proof coating between the indiarubber insulation and outer cover of cables] 2,747/05; E. WITZENMANN [Cable armouring] 3,257/09.

DYNAMOS, MOTORS AND TRANSFORMERS: E. S. G. REES [Dynamo frame] 3,157/05; W. GEIPEL and F. M. T. LANGE [D.C. motor control] 3,177/05; B.T.-H. Co. (G.E. Co., U.S.A.) [A.C. motor control] 3,590/06.

Switchgear, Fuses and Fittings: C. H. PEARSON [Conduit tube joints] 3,520/07.

Telephony and Telegraphy: G. W. PICKARD [Wireless receiver] 2,943/08.

Traction: W. M. MORDEY [A.C. traction booster system] 3,748/02; H. LEITNER [Train lighting dynamo] 3,391/08.

ELECTRIC TRACTION NOTES

Among the features of novelty in the passenger cars of the New York Municipal Railway Corporation, described in the *Electric Railway Journal*, are an automatic adjustment of the brake cylinder pressure according to the load in the car actuated by the deformation of the springs while the car is standing with the doors open; an automatic coupler which couples up all the brake pipes and electrical connections in the same operation as the main coupling; electro-pneumatic door operation with push-button control; and an automatic arrangement whereby the head and tail lights are caused both to show red when the reversing handle of the controller is put in the centre position, and when the train is broken the red lights at the point of separation automatically light up. When the controller is put in the running position the lights in the corresponding forward end of the train light up white. Another important feature is the automatic speed-control and cab-signalling system, which supplements the ordinary fixed signals and train stops, and gives the driver information as to when to apply brakes, when to resume normal speed, the permissible speed, the available braking distance, &c. This is contrived with a speed-control

system which automatically applies the brakes if the driver fails to obey the cab-signal indications and the speed of the car at any point is in excess of that established by a pre-determined braking curve. The apparatus involves a centrifugal governor acting in conjunction with a cam of special form and certain relays and contacts, and is not as complicated as might appear at first sight.

An agreement has been come to between the new Plymouth Corporation and the Devonport & District Tramways Co. for the sale of the Company's undertaking to the Corporation on Tramway Act terms. The arrangement at present is that the Company's line shall be transferred to the Corporation on October 7th, the price to be fixed by arbitration.

The strike of the London County Council tramwaymen came to a sudden termination on Saturday, when the unions instructed the men to return to work. A message to that effect was therefore telephoned to Mr. A. L. C. Fell, the Chief Officer. Meanwhile, the L.C.C. had issued a notice that no man of military age would be re-engaged, and some trouble arose on Sunday and Monday in regard to this. The result was that the union called out the men again, but the L.C.C., whilst not modifying its attitude, has agreed to consider reasons put forward by any man of military age for not joining the Army. The men have also returned on the Metropolitan electric tramway system, it is said without restrictions as to age.

"ELECTRICAL ENGINEERING" TRADE SECTION

ELECTRIC MOTOR CAR ACCESSORIES

A COMPREHENSIVE catalogue of electrical accessories for motor-cars has been issued by the British Thomson-Houston Co., Ltd. (Mazda House, 77 Upper Thames Street, E.C.). With the almost universal adoption of electric lighting and other auxiliary services on motor-cars, the matter is

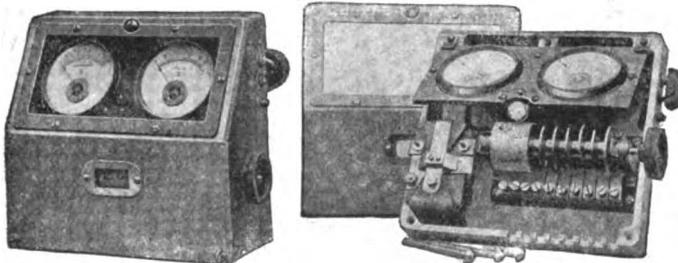

FIG. 1.—CAR-LIGHTING SWITCHBOARD, WITH INSTRUMENTS, TAIL LAMP TELL-TALE, AND AUTOMATIC CUT-OUT.

becoming one of increasing importance. Two very neat forms of lighting switchboard, with and without instruments, are illustrated here, together with a special form of twin armoured cable for car wiring. The larger board is provided with a tell-tale lamp within the case, which indicates whether the tail lamp is alight, and at the same time furnishes enough

FIG. 2.—SWITCHBOARD WITH CHARGING INDICATOR AND AUTOMATIC CUT-OUT COMPLETE.

FIG. 3.—TWO-CONDUCTOR ARMoured CABLE FOR AUTOMOBILE USE.

light to read the instruments. Several forms of car-lighting and ignition batteries are listed, and other articles dealt with include ammeters, voltmeters, lamps, horns, fittings for interior lighting, hand lamps, sparking plugs, switches, charging boards, cable connectors, cables, and other accessories.

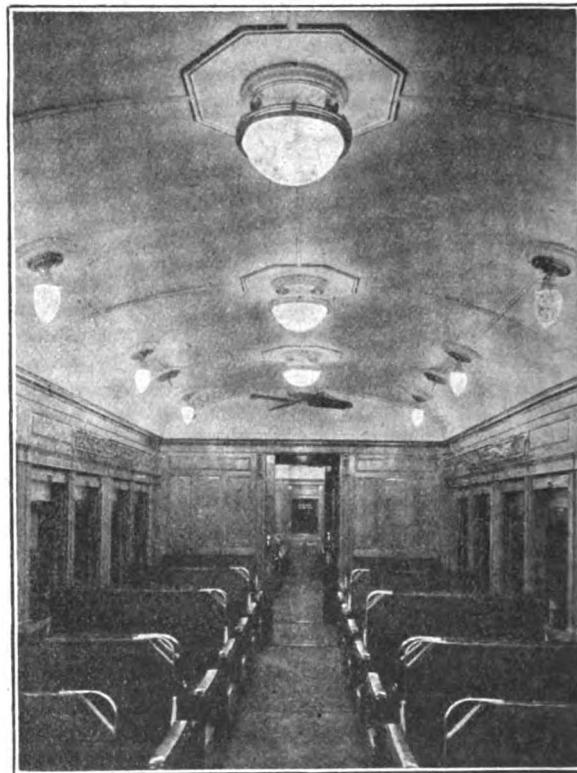

ELECTRICAL TIDE GAUGE

MESSRS. GENT & CO., Ltd. (Faraday Works, Leicester), recently completed an interesting application of their water-level indicating apparatus for the purpose of registering the state of tide. The apparatus is being used in conjunction with certain dredging operations now being undertaken by Messrs. Topham, Jones & Railton, and its purpose is to indicate to their vessels the height of the tide during the night. The apparatus, which is fixed on a timber dolphin about half a mile from the shore, consists of a 25-volt Walker Horrocks automatic electric lighting plant driven by a petrol engine, and having accumulators of 240 ampere-hour capacity for supplying the current to the five different coloured anchor type lamps. The mechanism, which is operated by a float fixed in a standpipe under the dolphin, consists of a number of switches operated by a lever which is geared to a chain connected with the float, and as the tide rises and falls, every 6-in. difference in level causes the switches to operate and cut in different groups of lamps in accordance with a pre-arranged code. Different combinations of red, green, and white lamps indicate a difference in level from zero to 19 ft. 6 in., and with a spring tide the change of lights takes place approximately every five minutes. The plant is entirely automatic in working, being self-starting, self-regulating, and

self-stopping, occasional oiling and replenishing of fuel only being required. If the engine fails to start, a warning is given by a red light at the side of the engine-house, but the cells will supply light for about four days after this warning has been given. A time switch is used in the circuit to cut off the current during the daytime. The view from the shore at night of the regular changes of colours in the group of lamps indicating the varying depth of the tide proves very interesting to watch.

RAILWAY CARRIAGE LIGHTING

AN increasing amount of attention is being paid to the subject of the correct illumination of railway carriages, and a good example of up-to-date practice is shown in the illustration. This railway carriage is one of a large number built by the Metropolitan Carriage Wagon & Finance Co., Ltd., at Saltley, Birmingham, for the Central Argentine Railway. The overall dimensions of the carriage are approximately 66 ft. by 9 ft. It is divided into two compartments, each 25 ft. by 9 ft., and both compartments are installed with four 12-in. Holophane

CARRIAGE LIGHTED THROUGH HOLOPHANE GLASSWARE.

reflectors (each equipped with two 40-watt lamps) down the centre of the coach, whilst on either side there are four Holophane "Pines" with 40-watt lamps. The energy provided in this case is very liberal, enabling an illumination intensity of 6 foot-candles to be obtained uniformly over the whole reading plane. Notwithstanding that the illumination intensity is so high, excellent diffusion and evenness are obtained from the use of the Holophane glassware, whilst glare and shadows are obviated. The carriage has a particularly lively and pleasing effect when illuminated, and the handsome furnishings are shown up to advantage.

The Teaching of Electric-light Switching.—A. P. Lundberg & Sons have brought out a new edition of their booklet on the teaching of electric-light switching. This aims at extending and systematising of this important, but until lately somewhat ignored, branch of electrical engineering, and its utility is vouched for by opinions of some teachers in technical schools reprinted at the end.

TENDERS INVITED AND PROSPECTIVE BUSINESS

Generating Stations, Sub-Stations, Mains, &c.

Derby.—The L.G.B. has sanctioned a loan of £25,090 for electrical extensions.

Northampton.—The Northampton Electric Light & Power Co. propose to construct a new power station at Far Cotton.

Redditch.—H.T. three-phase switchboard. Consulting Engineers, Handcock & Dykes, 11 Victoria Street, S.W. June 14th.

South Africa.—An expenditure of £20,000 on the East London electrical undertaking is contemplated.

Stalybridge Joint Board.—A loan of £4,000 for transformers and mains is to be applied for.

Wiring

Dundee.—The Corporation's premises in East Dock Street are to be lighted by electricity.

Eccles.—Electric lighting of Anson Street School, Winton. Town Clerk. June 19th.

Porth.—Electric lighting and fitting of police court. Clerk, Glamorgan County Hall, Cardiff.

West Ham.—Electrical installation at Knox Road School. Architect, W. Jacques, 2 Fen Court, Fenchurch Street, E.C. June 14th.

The following particulars relate to new buildings about to be erected, or important alterations and extensions in existing buildings. Wiring contractors are recommended to make inquiries to ascertain whether electrical work will be required.

Altringham.—New school.

Ashton-under-Lyne.—New school.

Colne.—New hospital.

Deal.—Extensions to Victoria Hospital.

Dumfermline.—Cinematograph theatre, Queen Anne Street.

D. Young, 118 Dewar Street.

Leeds.—Regent Picture House. Architect, F. Mitchell, 9 Upper Fountaine Street.

London.—Branch post office, Threadneedle Street, H.M. Office of Works, Storey's Gate, S.W.

Manchester.—Reconstruction of cotton warehouse after fire (£70,000). Faulkners, Knott Mill.

Stirling.—Sanatorium (£25,000).

Swindon.—Tuberculosis hospital.

Miscellaneous

Dublin.—Twelve months' supply of oils for Electricity Department. Town Clerk. June 10th.

Glasgow.—Twelve months' supply of electrical stores for the Clyde Navigation. General Manager, 16 Robertson Street.

TENDERS RECEIVED AND ACCEPTED AND ORDERS PLACED

Abercynon.—The Council has accepted the tender of the Electric Construction Co. for transformers and switchgear at £614, and that of the British Insulated & Helsby Cables, Ltd., for E.H.T. cable, L.T. mains, and public lighting at £2,099 19s.

Dundee.—Contracts have been placed with W. H. Allen, Son & Co., and John Wilson (London), Ltd., for pumps and cast-iron piping respectively, for the extensions at Carolina Port power-house.

East Ham.—A contract has been placed with the British Thomson-Houston Co. for a twelve months' supply of continuous-current meters.

Falkirk.—A contract has been placed with Venner & Co. for a twelve months' supply of Chamberlain & Hookham meters.

Glasgow.—Contracts have been placed with the B.T.-H. Co., Ferranti, Ltd., and Chamberlain & Hookham for twelve months' supply of meters.

Hendon.—The Board of Guardians has accepted the tender of the Hendon Electric Supply Co. at £339 11s. for an electrical installation at the workhouse.

Hornsey.—The Council have placed a contract with the British Thomson-Houston Co. for a twelve months' supply of D.C. ampere-hour meters.

London: *Hackney.*—Hitherto Chamberlain & Hookham and Ferranti meters only have been used in Hackney, but about twelve months ago 60 meters were supplied by the Electrical Apparatus Co., and gave good results. The prices of the latter are considerably below those previously used, and the difference in price is very marked in the case of the smaller meters. The Electricity Committee now recommends that a "sole-use" contract be entered into with the Electrical Apparatus Co. for meters up to 25-amperes capacity for one year, the prices being:—1·5 and 3 amperes, £1 each; 5 amperes, £1 4s.; 10 amperes, £1 7s.; 15 amperes, £1 11s.; 25 amperes, £1 13s.

Hammersmith.—On p. 201 of our issue for May 6th we referred to a report by the Electricity Committee, in which it was stated that Messrs. Johnson & Phillips, whose tender had recently been accepted for box-frames, covers, &c., had asked the Council to release them owing to Government work. Messrs. W. Lucy & Co. were asked to accept the contract, but they have intimated they will require an additional 7½ per cent. on the prices originally tendered. The Committee therefore recommend the Council to purchase as required in the open market, and not to accept any tender.

Manchester.—The following tenders have been accepted:—British Westinghouse Co., three 1,200-kw. static transformers; British Insulated & Helsby Cables, Ltd., cable; R. Seddon & Sons, electric wiring, &c., at New Islington School Clinic.

Rugby.—The tender of the Macintosh Cable Co. has been accepted for cable.

Amongst a large number of orders recently completed, Messrs. E. Bennis & Co. have supplied four sprinkler stokers and compressed-air furnaces for 8 ft. diameter Lancashire boilers, as well as two pairs of chain-grates, 6 ft. 6 in. wide by 11 ft. long, to the Rotherham Electricity Works. The firm has also re-linked two chain-grates with the Bennis patent links at the Liverpool Electricity Works.

MISCELLANEOUS BUSINESS NOTES AND TRADE ANNOUNCEMENTS

Price of Copper.—Although the Metal Exchange is not open for business in the ordinary course, Messrs. G. Smith & Son, of 5 Philpot Lane, E.C., inform us that the following may be taken as the official quotation for electrolytic copper bars, viz., £89 10s. to £90 10s. (last week, £86 10s. to £87 10s.).

Australian Trade.—We are requested to state that Mr. O. L. Remington, Manager of Wm. McLean & Co. (Melbourne), will be visiting London about the middle of June, making the Savoy Hotel his headquarters, and will be glad to get into touch with manufacturers of manufacturing machines generally, including wire-drawing, braiding, taping and rubber covering, and cotton-covering machines.

Advance in Prices.—Owing to the increase in the cost of aniline dyes, Siemens Brothers Dynamo Works, Ltd. (Supplies Department, 38 and 39 Upper Thames Street, E.C.), have found it necessary to advance the price of their lamp-colouring varnishes by 20 per cent. The price of Siemens lamp obscurer, which is an etching fluid, is also advanced 20 per cent. They have also found it necessary to advance their list prices of fittings and glassware by 10 per cent.

Companies Struck Off Register.—The names of the following have been struck off the Register of Joint Stock Companies:—County Electric Traction Co.; Electric Batteries & Carbons; Leeds Electric Co.; Southwold Electricity Works; Witney Electric Supply Co.

Bankruptcy.—A first and final dividend of 9½d. in the £ is to be paid in the bankruptcy of H. J. Godfrey, Electrical Engineer, lately carrying on business at 188 Balham High Road, London. This amount is payable on June 11th at the Official Receiver's Offices, 132 York Road, Westminster Bridge Road, S.E.

APPOINTMENTS AND PERSONAL NOTES

Mr. G. Marconi, who was in America when Italy declared war on Austria, is now on his way back to Italy to take charge of the Government wireless telegraph organisation.

The position of Borough Electrical Engineer at West Hartlepool is vacant owing to the death of Mr. H. F. Friederichs. Commencing salary, £400 per annum. Applications to Town Clerk by June 9th.

LOCAL NOTES

Birmingham: Electricity Accounts.—The revenue of the electricity undertaking for the year to March 31st was £379,625, compared with £346,561 in the previous twelve months. After meeting capital charges there is a balance of £60,385, from which the Committee has transferred £25,000 to renewals and special expenditure account, and the balance it is proposed to transfer to the credit of the Borough rate. This is £10,250 more than was contributed in the previous year.

Bury: Electricity Profits.—There was a net profit of £2,038 upon the working of the electricity undertaking last year. Of this, £1,000 have been transferred to relief of rates and the balance to reserve.

Derby: Increase in Electricity Charges.—In announcing an increase of 10 per cent. on the present charge for electricity, the Electric Lighting Committee point out that even this will not cover the extra expenditure involved by present circumstances on the working of the undertaking.

Dundee: Electricity Revenue.—The revenue of the Electricity Department for the year to March 31st amounted to £65,529, against £58,790 in the previous twelve months. After meeting capital charges there is a net balance of £2,835, which is carried forward.

Glasgow: Financial Control of Electricity Department.—As from June 1st Mr. James Fleming, Treasurer to the Electricity and Gas Departments, is retiring. The Corporation has agreed that in future the finances of the Electricity Department shall be placed under the control of Mr. W. W. Lackie, the Chief Engineer and Manager.

Hull: Electricity Accounts.—The electricity accounts for the year to March 31st show a net profit of £2,374, which has been carried to reserve. The Department has contributed £1,109 to employees who have enlisted, whilst £269 has been spent upon guarding works, both sums, of course, being met out of revenue.

Kilmarnock: Plant Extensions.—The installation of a new 1,500-kw. 3,000/3,300-volt 50-cycle three-phase turbo-alternator has just been completed. This has necessitated an extension to the boiler-house and the addition of another B. & W. boiler. The new plant also includes two rotary converters. The turbo-alternator and switchboard have been provided by the British Thomson-Houston Co., and the converters by Bruce Peebles & Co.

Leeds: Electricity Estimates Exceeded.—The estimated profit on the electricity undertaking for the year to March 31st, 1915, has been exceeded by £7,700.

London: Electricity Charges.—The Associated Municipal Electrical Engineers of Greater London has sent a circular to the electricity undertakings represented in its membership, pointing out that careful consideration has been given to the increased cost of generating electricity owing to the high price of coal, &c., but it is urged that the charge to the consumer should not be increased except where imperatively necessary. In such cases it is recommended that the increase should not exceed 10 per cent.

Salford: Electricity Accounts.—The accounts of the electricity undertaking for the year to March 31st, 1915, show a net profit of £8,406, compared with £3,629 in the preceding twelve months. The total number of units sold increased by one million. The whole of the available balance has been placed to the credit of depreciation and renewals fund. For the current year the Electricity Committee has notified the Finance Committee of its anticipation to hand over £3,500 to relief of rates.

Stoke-on-Trent: Meter-reading Error.—The Chairman of the Electricity Committee reports that certain mistakes by

meter-readers have resulted in the amounts due from some consumers being lower by about £1,000 than should be. The errors are explained by the fact that the meters in question are of a complicated type. The firms concerned have agreed to pay this amount. This incident recalls a similar one on a London supply company's mains, where the amount involved was considerably more than in the present case, and a legal action was necessary to establish the supply authority's right to the payment of the amount undercharged.

COMPANIES' DIVIDENDS, REPORTS,
MEETINGS, &c.

West London & Provincial Electric Supply Co.—This Company, which controls the Chiswick Electricity Supply Corporation and the Aberystwyth Electricity Supply Co., reports that at Aberystwyth the conditions last year showed more or less a normal improvement, owing to the town having a large number of soldiers billeted. The result is that more current than usual was used at the non-season period. An additional Diesel engine set is being installed. At Chiswick the Company was affected more or less in the same way as most of the London companies, the revenue being slightly less than in the previous twelve months. The 10 per cent. increase decided upon by the London companies has also been put into force at Chiswick.

Callender's Cable & Construction Co.—At the annual meeting last week the report and accounts given in our issue for May 20th, p. 222, were adopted. Mr. T. O. Callender, who presided in the absence through illness of the Chairman, Sir Fortescue Flannery, M.P., pointed out that while the result of the year's trading was extremely satisfactory, it had only been arrived at after a great deal of hard work and worry, owing to the disorganisation of business consequent upon the war. The amount of contract work had considerably decreased in consequence of the Treasury ban on capital expenditure by local authorities, and the large telephone contracts of the Post Office had, for a like reason, been suspended. On the other hand, the Company's large engineering business had been taken advantage of in connection with work for the army and navy, especially by the latter, with which the Company had always been in close touch.

Shanghai Electric Construction Co.—A dividend of 6 per cent. is recommended on the ordinary shares for the past year, and it is noteworthy that the loss by exchange on coinage during the year was no less than £28,038, equal to 8½ per cent. on the capital. The dividend now recommended is 1 per cent. less than in the previous year.

Electric Construction Co.—The report and accounts given on page 222 of our issue for May 20th were adopted at the annual meeting last week. Mr. P. E. Beachcroft, who was in the chair, called attention to the fact that during the past five years the gross profit has increased by more than 50 per cent. No less than 30 per cent. of the company's workmen have joined the forces with a consequent effect upon the output. The receipt of Government orders, said the chairman, did not necessarily mean larger profits than those accruing from ordinary business. The amount of profit available was sufficient to enable a larger dividend than 6 per cent. to be recommended, but the directors limited themselves to this amount, having regard to the uncertainties of the future.

Shropshire, Worcestershire, and Staffordshire Electric Power Co.—There was a net profit last year, including the amount brought forward, of £14,399. It is proposed to transfer £4,500 to reserve, to pay a 3 per cent. dividend on the ordinary shares, and to carry forward £899.

Cornwall Electric Power Co.—An offer of £60,000 5 per cent. debenture stock at 95 is being made to the shareholders. The proceeds of the issue, after payment of outstanding accounts for plant, &c., will provide about £21,000, which is necessary for new plant.

South Metropolitan Electric Light & Power Co.—An issue of £25,000 4½ per cent. first mortgage debenture stock at 95 is being made, and also £25,000 6 per cent. £1 cumulative second preference shares at par.

SUMMARY

SOME details are given of a large single-phase alternator of Swedish manufacture (p. 242).

THE switchgear required for balancer panels is discussed in our Questions and Answers Columns (p. 243).

FURTHER applications to join the Electrical Emergency Service are still welcome (p. 244).

AT the last meeting of the Development Committee of the I.M.E.A., reports were received from sub-committees showing progress that has been made, more particularly with the preparation of a publicity scheme (p. 244).

A PROPOSAL by Mr. R. Steylaers with regard to future British electrical trade with Belgium is referred to (p. 244).

AMONG the subjects of specifications published by the Patent Office last Thursday were petrol electric transmission, protection of alternators, circuit breakers, conduit fittings, and electromagnetic switches (p. 245).

MR. W. SLINGO, Engineer-in-Chief to the General Post Office, has been knighted (p. 246).

THE names of successful overseas competitors in Lundberg's Electric Light Switching Competition are announced (p. 246).

A CURIOUS point regarding the position of the Adnil Electric Co. has been argued in the courts (p. 246).

NEW forms of alternator field regulator and multiple switch starter are described and illustrated (pp. 246-7).

CABLES extensions are contemplated at Stretford and Turton; a loan of £3,391 has been sanctioned at Batley; a 50-kw. steam-driven dynamo is required for the Cottage Homes at Manchester; two water-tube boilers and mechanical stokers at Wigan; boosters, switch-

board panel and instruments at Wellington (N.Z.), and meters at Christchurch (N.Z.) (p. 248).

THE Dover Corporation has postponed its extension scheme owing to difficulties with the L.G.B.—The St. Pancras Borough Council and the L.C.C. are still unable to come to a decision with regard to the reduction of certain outstanding loan periods.—West Bromwich has decided to increase its electricity charges by 20 per cent.—The Dublin Corporation has finally decided on an increase of ½d. and ¼d. per unit for lighting and power respectively (p. 249).

Death from a 170-volt Shock.—Last week the inquest upon the death of a boy seven years old, killed by an electric shock on Volk's Electric Railway, Brighton, was concluded. On this railway, current is supplied to the trains by a live rail at 170 volts, with earth return. In view of the low pressure, the live rail is not protected in any way at level crossings, and, in fact, it is by no means unusual for children to amuse themselves taking shocks from it. A post-mortem examination showed that the boy was in a condition of status lymphaticus, which would make him very susceptible to electric shock. He had been paddling all day, his feet were bare, and his skin as well as his clothes was fairly well soaked with salt water. Apparently, instead of crossing the railway at the level crossing, he crawled up the piles on to the line, got a preliminary shock by touching the live rail and the earth return, which knocked him over, and he fell with his chin on the live rail and with his body, wearing a soaked jersey, across the rail. A burn on the chin showed that he was probably in this position for some time before assistance came. Evidence was given by Mr. J. Christie, Engineer and Manager, Brighton Electricity Works, and Mr. J. H. Rider, who both suggested that it would be well in future to put a strong wood guard on both sides of the live rail at level crossings, more or less on the lines of the guards adopted on the Underground Railways of London. The jury found that there was no culpable negligence on the part of anyone, but added a rider suggesting that the line should be fenced off with definite level crossings not more than 100 yards apart, and that notices warning people from crossing the line elsewhere should be put up.

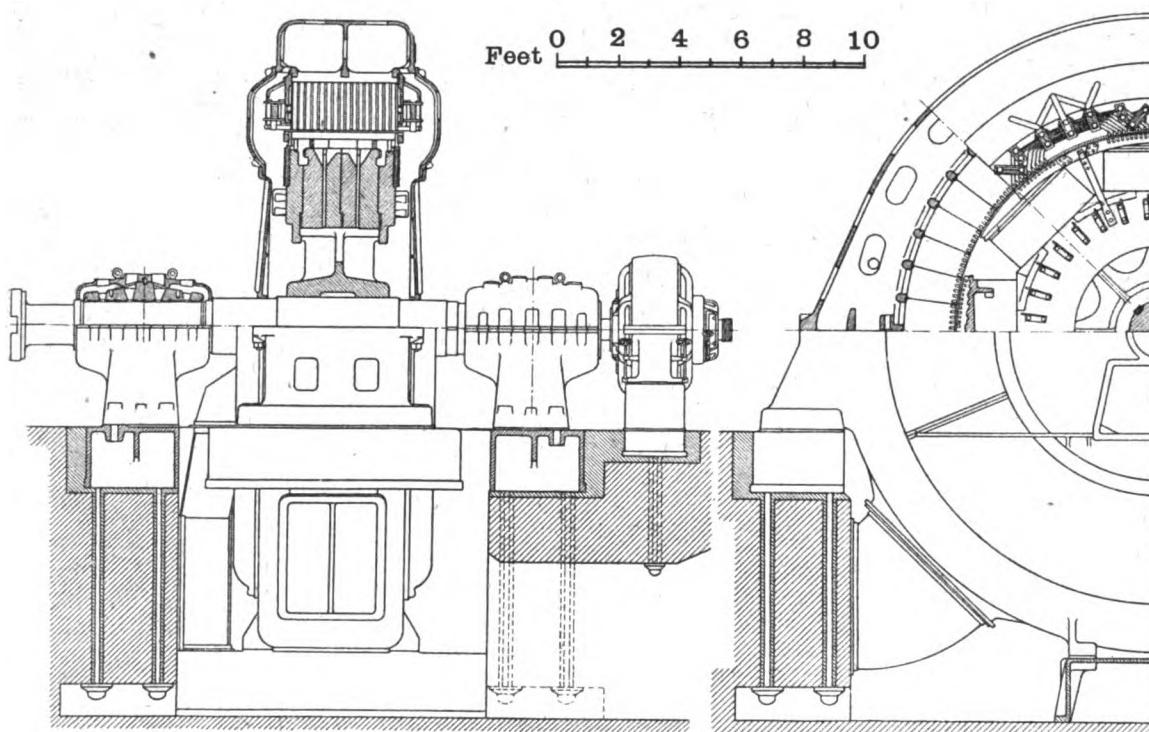

Coal Prices.—Mr. Runciman stated in the House of Commons on Tuesday that an understanding had been arrived at with the principal London coal merchants for a limitation of profits, but that negotiations with Midland coal-owners, with a view to fixing prices at the pit-head on the basis of last year's prices, had so far not resulted in a definite arrangement.

Arrangements for the Week.—*Thursday, June 17th.*—Incorporated Municipal Electrical Association, Annual Meeting, I.E.E., Victoria Embankment. Discussion on report by A. S. Blackman (Sunderland) and T. Roles (Bradford) on "The Practical Result of the Point Five Tariff," 10 a.m. Report by F. Ayton (Ipswich) on "The Use of Electric Vehicles in Municipal Service," 2.30 p.m. Parade of Electric Vehicles, 5 p.m. "Point Fives," Trinity House, Oxford Street, W., 7 p.m.
Friday, June 18th.—Incorporated Municipal Electrical Association, I.E.E., Victoria Embankment, Annual General Meeting, 10 a.m.

A LARGE SINGLE-PHASE ALTERNATOR

ONE of the generators in the Porjus water-power station from which current is derived for the working of the Kiruna-Riksgränsen single-phase railway in the north of Sweden, which is stated to be the largest single-phase generator yet built, is described in the *Elektrotechnische Zeitschrift* for May 13th. The machine in question, however, is not of German manufacture, but was constructed by the Swedish firm, Allmänna Svenska Elektriska Aktiebolaget, of Westerås. The alternator is rated for a normal continuous output of 6,250 k.v.a. and a maximum overload for short periods of 10,000 k.v.a., and is of the horizontal-shaft type direct coupled to its turbine, and running at 225 r.p.m. The machine is compounded on the Danielson system by means of a rotary converter and booster acting on the exciter field, so that the no-load voltage is 3,400 volts and that of the full overload 4,150 volts at 15 cycles per second. At the normal voltage at no-load the excitation required is 6.5 kw., but at 10,000 k.v.a. at 0.8 power factor the figure rises to 55 kw. The machine, in view of the speed and frequency, only has eight poles, which are circular in section and necessarily of large diameter, so that ventilating ducts are required for their adequate cooling; cooling fins are

The general construction of the machine is shown in the figure. The stator is of massive construction, and the end connections are securely anchored. The bars forming the winding are split into two separate conductors to diminish eddy currents, and mica slot insulation is employed. The rotor departs more from ordinary design than the stator on account of the high speed and low number of poles to the size of the machine. The high peripheral speed renders steel exclusively necessary, and the rotor body is composed of steel rings built up on a Siemens-Martin steel hub. Each ring alone weighs about 10 tons. These have the pole projections cast on. This construction has been employed by the manufacturers with success in other large machines, such as the 10,000-k.v.a. alternators at Trollhättan and the still larger 17,000-k.v.a. machines for Rjukan, and the Swedish steel works make a speciality of large steel castings of this nature. The pole-pieces are not affixed by screws in the ordinary way, but a form of bayonet joint is employed of greater strength and reliability. The pole laminations are of thick core plate dovetailed in, and carry the damping winding in slots, and a ventilation space is left between the end rings and the pole-plates. The machine is entirely enclosed, and a radial ventilating current of air is produced by fan-blades on the rotor. The air is drawn in and expelled through a duct

SECTIONAL ELEVATIONS SHOWING DETAILS OF 6,500-K.V.A. SINGLE-PHASE ALTERNATOR.

also provided on the winding. A damping winding is provided of the same conductor section and in the same number of slots as the armature winding, connected to two stout copper rings on either side. The pole-shoes are laminated, and in order to avoid superposed high harmonics on the voltage wave-form, the damping bars are staggered. The effect of the high time constant of the magnetic circuit of the field system in causing the alterations of flux to lag behind changes of excitation is very appreciable, and has considerable effect on the action of the compounding system, and the presence of a damping winding tends to enhance this lag, but its effect in this direction is less than if it were placed, as is sometimes done, outside the field coils owing to the influence of magnetic leakage, and tests show that the presence of the damping winding has not raised the time constant (*i.e.*, the time taken for the full exciting current to reach its full value) more than 30 per cent. above its calculated value of 12 seconds. This sluggishness in flux change not only affects the voltage regulation of the machine on sudden changes of load, but raises the possible momentary short-circuit current to a very high value. In view of these facts a special form of quick-acting voltage regulator is employed, which applies at first a very much higher change in excitation than is required for the permanent change of flux required, while permitting the compounding arrangement to take charge of the permanent value of the field.

of some considerable length, as the turbine-room is underground. The total weight of the machine is about 200 tons, of which 85 tons are accounted for by the rotor. The following efficiencies are taken from a curve in the article referred to:— $\frac{1}{2}$ load, 92.6; full load, 95.1; and 50 per cent. overload, 96.3 per cent. The machine has withstood short-circuit tests without damage, although the maximum current attained was fifteen times the normal.

The "Central."—The May issue of the magazine of the old students of the City and Guilds (Engineering College), South Kensington, contains, among other interesting contributions, some notes by Prof. Howe on the British Association meeting in Australia. Some notes also describe the uses made by the military authorities of the college premises at the outbreak of war, when a considerable force was quartered in some of the buildings. Subjects of technical articles include applications of the mercury arc, Diesel engine troubles, and the future possibilities of domestic electricity. An account is also given of an expedition to Sweden last summer to observe the solar eclipse, and the issue concludes with a lengthy Roll of Honour, which shows how well "Old Centralians" have responded to their country's call.

Research Scholarships.—The Manchester Municipal School of Technology offer one research scholarship of £60, three of £75, and six of £50. Particulars can be obtained from the Registrar, and entries must be sent in by June 21st, 1915.

QUESTIONS AND ANSWERS BY PRACTICAL MEN

RULES.

QUESTIONS: We invite our readers to send us questions, preferably on technical problems that have arisen in actual practice. Questions which we consider of sufficient general interest to our readers will either be replied to under "Answers to Correspondents," or replies will be invited from our readers. One shilling will be paid for the question which we select for competitive replies in this column.

ANSWERS: A fee of 10s. will be paid for the answer which we consider shows the greatest merit, and 5s. for the one we select as second best. Replies should reach this office within seven days of the appearance of the question. In judging the replies, importance will be attached to clearness and conciseness, as well as accuracy. The Editor reserves the right to make no award, or to accept only one reply, if, in his opinion, the answers received do not possess sufficient merit. Competitors desiring the return of their manuscripts, if unaccepted, should enclose stamped addressed envelope.

Write on one side of the paper only, and if diagrams are sent, draw them on a separate sheet of paper attached to the manuscript. Competitors may adopt a "nom de plume," but, both in the case of questions and answers, the competitor's real name and address must be sent with the manuscript as a guarantee of good faith. No correspondence will be entered into with regard to unsuccessful replies. The Editor's decision is final.

QUESTION No. 1,446.

A manufacturer sent a shunt motor and starter, both in perfect order and carefully inspected and tested, to a distant job. He received a telegram from his customer stating that the motor ran enormously above its rated speed. What is the most probable reason that the manufacturer would suggest for this?

(Replies must be received not later than first post, Thursday, June 17th.)

ANSWERS TO No. 1,446.

State briefly and concisely what switchgear is necessary for a balancer panel for a 3-wire supply system, and explain its connections and the function of each piece of apparatus.

The first award (10s.) is given to "Y. Z." for the following reply:—

The switchgear for a three-wire balancer panel is shown in its very simplest form in the diagram (Fig. 1). The various items are as follows: F_1 , Sw_1 , and F_2 , Sw_2 , are a double-pole switch and fuse, which may obviously be replaced completely by a double-pole overload-type circuit-breaker. A_1 and A_2 , are centre zero ammeters, one for each side of the balancer.

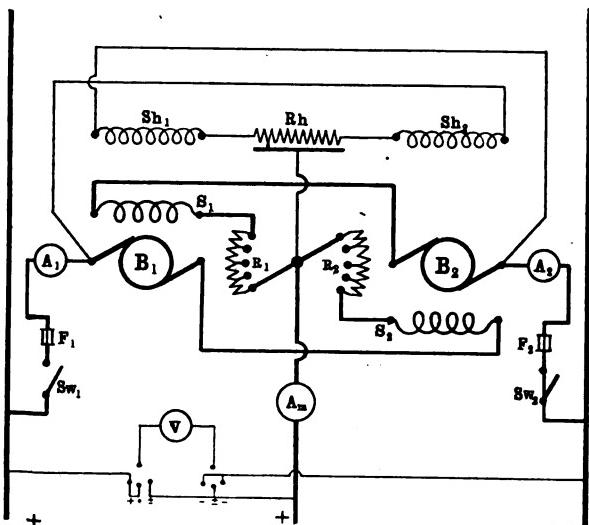

FIG. 1.

These two ammeters may, if desired, be replaced by the single ammeter Am , also centre zero type, which shows the current in the middle wire. The current in Am is at any moment the numerical sum of the currents in A_1 and A_2 , less the shunt current. R_1 and R_2 is the starting arrangement for the balancer. The set is started up exactly as if it were two motors coupled

together mechanically and connected electrically one to each side of the three-wire system. When the double-pole switch is closed, current can flow in each armature B_1 and B_2 at once, as the common lever arm of the two starting resistances is arranged never to break contact with the resistances; i.e., there is no "off" position of this switch. If thought desirable in any case, the starter may be provided with a no-volt release consisting of a hold-on bobbin connected across the mains. R_h is a shunt regulating resistance arranged to cut resistance out of one field circuit at the same time as it cuts resistance into the other. If desired, this may be replaced by two independent regulators; and, further, in the case of a balancer properly designed with compound winding to give a fixed voltage on each side of the system under all possible circumstances within its specified range of power, a shunt regulator becomes unnecessary altogether. V is a voltmeter with a three-way double-pole selector switch, connected so that the instrument may read the volts between + and - or + and ± or ± and -.

The above is all the external apparatus required. The balancer is started by closing the double-pole switch, and cutting out R_1 and R_2 simultaneously. It will be noted that the arrangement shown has the advantage of providing a discharge circuit for the shunt field winding of each machine through the armatures, thus dispensing with the necessity of a separate shunt breaking switch and discharge resistance. Should the set not be automatically self-regulating, the resistance R_h (or the equivalent pair of regulators already mentioned) will need re-adjustment from time to time. The actual disposal of the various pieces of apparatus on a panel will of course be determined by the circumstances of each case, e.g., what room and what shape of space is available; whether the panel is self-contained or forms part of a main switchboard, and the like.

A word in conclusion may be said about the internal con-

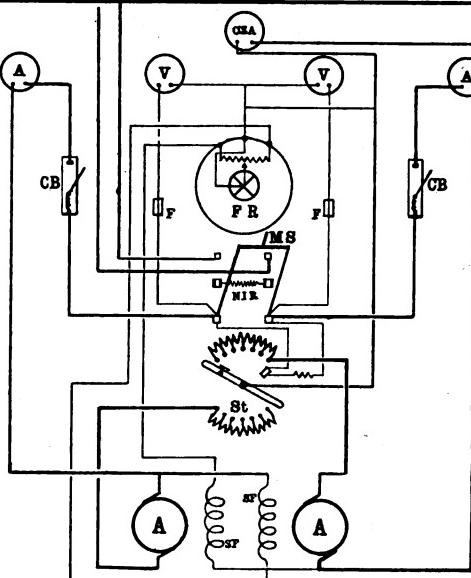

FIG. 2.

nnections of the balancer. This consists, as is well known, of two machines forming practically an automatically reversible motor-generator. The series windings S_1 and S_2 are so connected that they assist the shunt windings Sh_1 and Sh_2 in producing flux when the machine acts as a generator, and therefore they act against the shunts when the machine acts as a motor. The series windings are shown crossed, i.e., the generator current excites the motor series, and vice versa. This precaution is taken because if the motor excited its own shunt, a heavy short-circuit or overload might cause too much weakening of the motor field, resulting in a flash-over at the brushes. With the connections shown in the diagram, however, the generator field is abnormally strengthened in such a case, which causes the desired result to be obtained with more rapidity than would otherwise be the case. The shunt windings are also shown crossed, even with a compound wound machine, because here too the momentary drop of volts on the overloaded side causes the motor to run away a little when the shunts are crossed, while the generator field is strengthened, causing the apparatus to be more sensitive than if the shunts were not crossed. Hence crossing the shunts gives sensitivity, and crossing the series gives stability. Sometimes the series windings are coupled in the middle wire itself, and carry the full out-of-balance current. This arrangement is also quite satisfactory, but leads to less quick action than that shown in the diagram. If heavy overloads are anticipated, interpoles should be provided. These are not shown in the diagram, but they would be coupled up so that the interpole winding of each machine carried the current of the armature of the same machine, for obvious and well-

known reasons. The two armatures are denoted by B_1 and B_2 , as already stated.

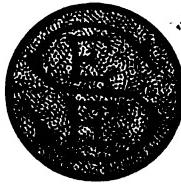

The second award (5s.) is made to "J. E. R. R." who writes as follows:—

The diagram in Fig. 2 shows the essential switchgear for a three-wire balancer panel. It contains the following gear: main switch (*M.S.*) fitted with quick break blades and special contacts so arranged that, should the main switch be pulled out with the starter on the dead notch, a non-inductive resistance (*N.I.R.*) is first put in parallel with the field windings before the circuit is broken. This, of course, prevents breakdown through inductive kicks, as it is not possible with balancer sets to wire the fields from the first notch of the starter resistance as is usually done in the case of single machines. Two circuit-breakers (*C.B.*) or fuses, the former being preferable. Two ammeters (*A.A.*) reading the current taken by each machine and two voltmeters (*V.V.*) reading the volts across each outer and neutral with protective fuses in series. A central zero ammeter (*C.Z.A.*) reading the current in the neutral wire or the out-of-balance current. A starter (*St.*) for starting the set-up by inserting and cutting out resistance in series with each armature, and, though this is really not essential, but is advisable for protective purposes, a no-volt coil and series resistance tapped across the mains. A combined field regulator (*F.R.*), the centre terminal of which is coupled to the contact arm, and the other two to the ends of the resistance, so that when the regulator handle is turned, resistance is put in one field winding and taken out of the other, according to the load.

The fields of the machines are shown cross-connected to make the set approximately self-regulating. It will be seen that if a load comes on, say, between positive and neutral, and tending to lower the voltage on that side, it weakens the field of the machine operating on the other side, negative to neutral tending to speed the set up and increase the volts of the machine operating on that side which has received the load. Shunt wound machines only have been shown, but the addition of a series winding does not call for any further switchgear except in the cases of special sets, which sometimes are fitted with diverter resistances and short-circuiting switches across their series windings. There are two points relating to the switch-gear that it is well to keep in mind. In the first place, the resistance coils of the field regulator should be amply designed and carefully watched, as an open circuit occurring in any coil may lead to the wrecking of the set. Secondly, the writer has found it convenient to put a switch in the neutral wire or make one of the terminals on the central zero ammeter easily removable so as to be able to disconnect the set quickly from earth for testing purposes.

THE ELECTRICAL EMERGENCY SERVICE

WE want every electrical engineer in London who will give at least either four hours a day of his spare time, or four hours on alternate nights, to become enrolled in the Electrical Emergency Service.

This Service is filling the gaps caused by switchboard attendants in London electricity works and substations who are leaving, or have left, to join the Army and to make munitions of war. A badge, of which the annexed sketch is a facsimile, is issued to members of the Service on taking up their duties.

We have many names on our register already, but not enough to meet the emergency demand which is certain to occur during the next few weeks in view of Lord Kitchener's appeal for 300,000 more men.
